THE BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD

APPEALING TO THOSE ENGAGED IN

THE ART OF BUILDING.

IT is our aim, our ambition, our aspiration even, to build our Journal worthily and well, not for the hour only, but for future years; for the few men in the forefront of an enduring and a laborious Art; for the disciplined ranks of a distinguished Profession; for the young men—Architects to be—and for all who love a clustered column or a flying buttress, a traceried window or a Greek frieze; for the man, too, who honestly plumbs a jamb. . . . . .

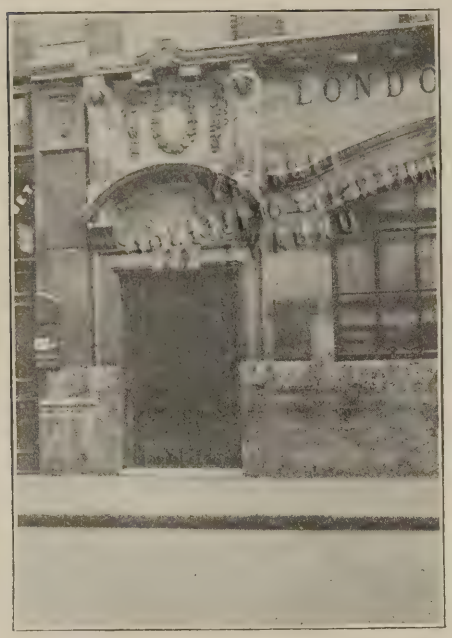
An Architectural Causerie.



To Our Readers. With this number we commence a new volume, and the occasion has given the opportunity for a number of improvements to be made in the form and appearance of the journal. Our constant endeavour has been to make the journal useful and practical in its matter, artistic and interesting in its illustrations, and attractive in its appearance, holding to the idea that the journal of an artistic profession should be artistic itself. We are happy in continually hearing that our efforts are appreciated, some of our readers being kind enough to express the opinion that The Builders' Journal is better illustrated and has a better appearance than any weekly periodical at so low a price. It will be noticed that there are several important improvements in this first number of the new volume, the chief of which are the new cover design (printed in a better colour than formerly), new type and improved paper. These alterations, taken with the additional double-page lithographs employed for the centre plates each week, and the special arrangements we have concluded with our printers in order that the illustrations may be reproduced in the best possible manner, will, we think, bring The Builders' Journal into an unrivalled position. As regards the matter itself, it has been our policy to illustrate and deal with architectural subjects both old and new, so that we have had articles on various phases of different styles, and, at the same time, have kept our readers conversant with all the best modern work both at home and abroad. Moreover, we have given special prominence to constructional articles by acknowledged experts, believing these to be of the greatest use to the student; whilst the items of news relating to architectural, building and allied work have, by more extended arrangements, been made current and complete.

One of the Clergy. Though amateur building is familiar enough, amateur restoration is new to us, in saying which we do not mean restoration by professional men which could not have been more disastrous if done by a novice, but actual restoration by an amateur. This, we learn, is a hobby of the Rev. W. Burland, M.A. He has been busy on several churches, but the last is that of Compton Martin, near Bristol. This is (or maybe was) an extremely fine example of Norman work of its class, so that the late Mr. E. A. Freeman, whilst addressing an assembly of archæologists in it a generation ago, found much to eulogise. Whether he would do so now if he were alive we cannot say—probably not if the vicar's hobby led him to be his own judge; but we are glad to note that Mr. T. G. Jackson, R.A., has acted as his expert adviser. Many alterations have been made. The east window, put in within the last half century, was an imitation Norman one, which excited the hostility of Mr. Freeman. It has now been replaced by a new stained-glass window following the lines of Mr. Freeman's description of the older conditions. In the south aisle church restorers of long ago pushed up the roof to such an extent as to hide from an outside spectator the clear-story on that side. Nor was it visible from within, for the ceiling came below it. The rector has taken away this lath-and-plaster ceiling, and now the long concealed clear-story can be viewed without obstruction. This has made visible the row of holes in which once rested the rafters of the Norman roof. We have said that restoration is the rector's hobby; and we are assured that he takes an actual working part in the alterations which he makes. In this last instance he selected his own workmen and laboured with them; in fact there is a local rumour that the reverend gentleman is rather prone to work longer than the trade-union number of hours—but rumour spoke ill of even Cæsar's wife. However, the case is rather a unique one, though the precedent is dangerous enough; for if other parsons take it into their heads to go chipping and furbishing on the churches under their control we may soon expect them all to be as spick-and-span as any new hotel.

Housebreaking. When the burglar goes a-burgling he does not concern himself in any way with the regulations which may have been drawn up for his benefit, but in future his namesake the housebreaker will have to confine his work to certain hours. At a time when so many old buildings are being pulled down to make way for new ones, or to enable street widenings to be carried out, the nuisance caused by clouds of dust from bricks and mortar has become very serious, causing much annoyance to passers-by. It is therefore proposed to draw up a series of regulations on the subject, so that demolitions will not be allowed to proceed all through the day to the great discomfort of the public, and it is also intended to enforce the use of some method—such as water sprinkling—to prevent the clouds of dust that now occur. Whilst referring to this matter it is instructive to note that in the course of an inquest held last week on the body of a labourer who was killed by the sudden fall of the first floor of an old house being demolished in Tottenham Court Road, Mr. C. F. Hayward, district surveyor of Holborn, explained that he had no control over the demolition of old premises, which were generally pulled down in a very careless manner. The jury, in returning a verdict of accidental death, called attention to the danger in such cases of loading floors with rubbish, and expressed the opinion that those demolitions should be under the jurisdiction of the district or borough surveyor.

RECENT STREET ARCHITECTURE IN LONDON.—VI.

By F. HERBERT MANSFORD.

(*Continued from p 377, No. 390.*)

IN a review of current architecture in the City published in this journal more than a year ago the first building referred to was the Prudential Assurance Company's premises at Furnival's Inn, a structure which has already altered the character of this part of Holborn, but which it is still premature to criticise. The principal elevation is now sufficiently free from scaffolding for the general design to be comprehended, but it should be borne in mind that the frontage was acquired at three distinct dates, and this has necessarily governed the disposition and proportions of the façade. The tower cannot fail to be an effective feature in the view both up and down Holborn, but will also be seen to particular advantage from Chancery Lane, looking along Southampton Buildings and over the roof of the hall of Staple Inn. The environment of this Inn is changing too, and the old half-timbered front is now seen between a buff terra-cotta façade on the east and the red terra-cotta of the new chambers on the west. The former is but the commencement of a block for Messrs. S. Lewis & Co., drapers, and the latter will be partly occupied by the Patent Agents and the Institute of Actuaries. At the rear of the Inn the tame Jacobeanism of the Patent Office extension carried out in white Suffolk bricks is in strong contrast to the blue and brown of the now completed Birkbeck Bank. The colour of this building is, perhaps, a successful characteristic; the writer at least must admit in this connection that an initial dislike has given place to a feeling almost of gratification so far as the south and west elevations are concerned, for in these the colour is warmer and less broken up.

At the north end of Fetter Lane one cannot fail to recognise the art of Messrs. Treadwell & Martin in an elevation peculiarly modern in conception and detail, yet one that does not overstep the recognised bounds of architecture. The segmental stone arches upon granite piers support a façade divided into three divisions vertically by projecting piers of masonry rising through and above the gable coping. The gable itself is terminated with a shell pediment supported by nude figures seated upon mullion-like pilasters. Iron stays are considered necessary behind this mass of masonry, to enable it to withstand wind-pressure. The carving generally is of a free and varied Renaissance character.

At the south end of the Lane, at the corner of Fleet Street, are extensive shops and office premises designed for the proprietors of the "Sheffield Daily Telegraph" by Messrs. Flockton & Gibbs (illustrated on the opposite page). The elevations are faced with dull-glazed faïence blocks of delicate tint, enlivened by coloured heraldry above the second storey representing the cities and towns in which the journal circulates. The little open colonnade above the staircase is a somewhat remarkable feature of the skyline. The building is worthy of a more spacious site, where, amongst other things, a greater width and strength could have been given to the piers at the angle.

At No. 88, Fleet Street (the offices of the "Birmingham City Post") is discernible the peculiar distinction which Mr. Belcher, R.A., never fails to give even to unobtrusive buildings. In this case the architect has depended for effect mainly on the restraint of the rusticated unpolished granite substructure and a refined treatment of the masonry above; only in the niches of the first storey and the blocking-course above the cornice does one see anything tangibly original.

In New Bridge Street the Rock Life Assurance Company have re-faced two of the old houses with stone, and, with due regard to the height of adjacent buildings, have preserved the continuity of the cornice line of the block. The enrichments are in the manner of Robert Adam.

On the east side of Queenhithe is a new warehouse with offices above possessing dignity and preserving well the character of its surroundings, while being by no means a merely antiquarian reproduction. The sole enrichments are the City arms and the foliage and lions' heads above the doorway; the rusticated columns of the ground storey are of polished Purbeck marble.

A further extension of the Stock Exchange in Old Broad Street emphasizes the piecemeal way in which this building has been conceived and carried out, a method doubtless due to the excessive cost of land in its vicinity. The portion of the façade completed a few years ago has undergone several small alterations to its detriment, such as the blocking-up of windows with masonry, &c. An occasional repetition, in the length of the façade, of the roof pavilion just erected would add dignity to the skyline—perhaps this is in contemplation.

In Throgmorton Street the Drapers' Company have completed the exploitation of the site formerly entirely occupied by their hall. The new stone building of which they occupy the upper portion possesses a very distinctive elevation, mainly due to the fact that it consists of but two storeys, one of which is kept in strict subordination to the other (see p. 4). It is not easy to vary "the orders" with success, yet few would criticise adversely these well-drawn pilasters with their richly-carved capitals and slightly unorthodox frieze. The pediments of the windows gain enormously by the extent of plain wall surface above them, and if the supporting consoles are considered to spring abruptly the effect is at least vigorous. The wrought-iron balconies are rich, pleasing and un-English in design, yet their swelling curves seem just what is wanted to give a touch of grace to the façade. The ironwork below appears somewhat tame and inharmonious. Mr. Charles Reilly is the architect of this building, and of the Throgmorton Restaurant adjoining.

NAME PANEL, OCEAN BUILDINGS.

OCEAN BUILDINGS, MOORGATE STREET, E.C.

The British Linen Company's Bank in Threadneedle Street (see centre plate) is a handsome stone building, from the designs of Mr. J. Macvicar Anderson, but it calls for little comment. It possesses the common-sense and rather unimaginative character usually considered suitable to a prosperous commercial corporation. That the third storey recedes considerably in the centre of the block may be due to neighbouring rights of light; the loss of space within is an architectural gain without, but it raises the difficult question as to how two balustrades should be treated when in perspective they will be viewed the one immediately above the other.

In the article previously referred to the general disposition of Mr. Collcutt's elevations for Lloyd's Registry were briefly described; the building is now adorned with sculpture and completed (see centre plate). Above the ground-floor windows is a beautiful frieze composed chiefly of female figures of that type already made familiar to us by Mr. Frampton, R.A. Charming as they are in themselves, it may be considered that in this instance they are not entirely suitable, lacking somewhat the robustness and vigour which is appropriate to a race of sailors and a building which is intimately associated with the greatest mercantile marine in the world. Father Neptune does not appear in this artistic assemblage; indeed, his brawn and muscle would appear strangely out of place. Very delightful are the weather vanes and the four bronze figures between the columns of the ground storey. The triple entrance gates in Fenchurch Street (see p. 1) are of great beauty of design and workmanship. The openings in which they occur are of equal width, but as the centre one is higher it appears slightly narrower; one now perceives that the side openings could have been slightly contracted with advantage.

In Minories is a recently erected branch of the London and County Bank. The entrance, shown in the accompanying photograph, is of blue and white stone with a plasterwork panel above, and affords a point of interest in an architecturally dull thoroughfare. Is it hyper-critical to suggest that the unoccupied space in the centre of the garland leaves the upper part of the composition a little pointless?

Anyone familiar with the Institute of Chartered Accountants must have awaited the removal of the great hoarding on Finsbury Pavement with impatient interest. The drawings of Electra House exhibited at the Royal Academy only served to heighten one's anticipation of a modern city block as dignified as any erected in the days before "degeneracy" was so much discussed, and fresher than most in detail. Unfortunately, much of the sculpture exists only on paper, for considerable modifications have taken place. The ruthless hand of economy has stifled in their birth numerous little boys: the square block pedestals between the dormers, now carrying standards for electric light, testify to the hopes of their existence. But we must admire the spirit of a company which, in order to complete its own architectural scheme, even proposed to demolish a costly block of offices erected but twenty years ago. The ground storey is constructed of unpolished grey granite with a superstructure entirely faced with Portland stone (see centre plate). The central entrance (illustrated on p. 6) is under a semicircular arch enclosing triple doors of copper between bronze-capped columns of green veined marble. These same capitals are decorated with dolphins, and are very charming in effect. The spandrels above the arch are occupied by figures emblematic of Electricity and Engineering, which trespass slightly upon the archivolt. The wings of the building are partly recessed behind widely-spaced Corinthianesque columns with capitals of

NO. 181, FLEET STREET, E.C. FLOCKTON AND GIBBS, ARCHITECTS.

varied but always beautiful design. The whole is dominated by a copper dome raised upon an octagonal drum of masonry and surmounted by an armillary globe of metal, borne by figures which recall those of Galileo's lamp at Pisa. Below the drum the fourth storey curves inwards and thus permits a more complete view of the dome from the pavement, besides affording emphasis to two of the pedimented masses which break up the façade at intervals. In Mr. Belcher's Academy drawings the four figures in low relief at the third-floor level were only part of a continuous series. They were shown supported by a course of scroll-like carving; this has been omitted in the actual work, and the figures have somewhat the appearance, in consequence, of standing upon a shelf. Until the corner of London Wall is rebuilt on the quadrant-shaped plan proposed, it is impossible to realise fully the architect's conception of the dome as seen from Moorgate Street: the accompanying view shows the effect from the North with the return frontage of the building in West Street, and the two-storeyed bay upon the angle. It is, perhaps, an open question if this bay, however good in itself, is an acquisition to the structure as a whole, or whether the angle would not have appeared stronger without it. The two windows on the cant above the bay and those on either side below the sculptured panels have been but recently inserted, rather to the detriment of the elevations, for the unusual amount of solid masonry had a fine effect.

Near by is a still larger block, Salisbury House; it contains many shops and about nine hundred offices. Its three frontages to Finsbury Circus, Circus Place and London Wall are entirely faced with stone. In the first-named elevation the elliptic curve of the site is ignored, preference being given to a series of short straight planes at slightly varying angles. After this, one will not anticipate that æsthetic considerations have weighed any more heavily with the designers than with the committee of the Corporation, who leased the site without ensuring that a harmonious architectural conception should be worked to around the whole Circus, more than half of which has been recently demolished.

The Electric Railway Station on Finsbury Pavement is mainly effective by the simplicity of its steep roof, gabled towards the principal elevation but disclosing itself fully at the side; here, however, it has been curtailed by ancient lights, and the ridge drops rather ignominiously.

Fifteen years ago Moorgate Street was perhaps the most symmetrical thoroughfare in the City—a quarter of a mile of unbroken classicism frequently rejuvenated by fresh paint. Now its level skyline is twice broken by Gothic spirelets, and stucco fronts contend with fashionable red brick. Ocean Buildings (why plural?), illustrated on the opposite page, display either the design or the influence of Mr. Huntly-Gordon. The tucked-in bay contrived without projection is a favourite device of his, and the mouldings and enrichments are equally characteristic. The back elevation is interesting in its treat-

ment and carefully considered, as may be judged from the small detail view of the name panel above the courtway.

The fire station in Redcross Street (see centre plate) may be regarded as an outcome of the Cripplegate fire of 1897. It marks a departure in design from its predecessors inasmuch as there is no feature which could be described as Gothic. The ground storey is faced with stone, but above red brick rises to the cornice relieved by the white paint of the small-paned iron casements. The cornice is shallow but of great projection, and gives that accent of shadow which is perhaps the most effective ornament a building can possess. Above, a gable of multangular outline has evidently been considered in relation to the vista down Jewin Street, which is directly opposite.

Newgate Prison fortunately seems to own a charmed life. Years ago it was condemned, and prisoners were sent elsewhere; at length a competition of designs for a new Sessions House on the site was held and decided, detailed drawings have been prepared, quantities taken out and tenders sent in, but still those expressive walls frown at us with admonition and suggest considerations as to the influence of Architecture upon Ethics. No erring draughtsman of the future will be able to occupy his mind with the historic and architectural dignity of his habitation, nor are Holloway or Brixton likely to inspire a future Ingoldsby. Meanwhile more modern buildings around rapidly give place to others. In Newgate Street, almost next door to the prison, premises have just been completed from the designs of Mr. C. Stanley Peach. The materials of the elevation are artificial stone and red brick, with teak joinery below and green painted woodwork above. The archway shown in the centre plate is in the middle of the façade, for the segmental bay is repeated on the other side. This arch and the windows and pediment above form a pleasing composition in themselves, and the mouldings and enrichments are everywhere fresh in character. The architect has evidently a liking for swags: one sees swag capitals, a swag keystone, swags between the "amorini," and swags take the place of heraldry upon the shields.

Great changes will take place in this vicinity shortly; the housebreakers are at work, and Christ's Hospital in London will soon be but a recollection, like Bridewell, Doctors' Commons or the Fleet.

(To be concluded.)

St. Mary's Cathedral, Middlesbrough.—The north and south transepts, blessed sacrament chapel and baptistery are now being erected, and the whole of the work has been entrusted to Mr. Anthony Lyons, builder and contractor, of St. Peter's Works, Norton Malton. The architect is Mr. E. Goldie, 31, Upper Phillimore Place, Kensington, W.

DRAPERS' HALL AND OFFICES, THROGMORTON STREET, E.C.
CHARLES REILLY, F.R.I.B.A., ARCHITECT.

THE FIREPROOFING OF HIGH OFFICE-BUILDINGS.*

By PETER B. WIGHT, F.A.I.A.,
Consulting Architect.

HIGH office-buildings have been made a success by the possibilities of construction developed with them. They were first built with brick walls, and the highest reached to sixteen storeys. Skeletons of cast-iron columns and rolled-iron beams were going up to the same height at the same time. The whole-steel skeleton came when the introduction of rolled steel superseded rolled iron, and it has continued to be the standard construction for these and many other kinds of buildings ever since.

But the possibility to attain this great height with safety came with the inventors of light hollow-tile systems of floor construction. The weight of floors was reduced before the weight of walls. Up to 1881 the average of fillings between I-beams of buildings having combustible floors was 70lbs., whether with brick arches or with corrugated iron covered with concrete. They were at one stroke reduced to 30lbs. by the use of flat hollow-tile 6in. arches in the nine-storey Montauk Block at Chicago. You all know what that means in computing the strength of foundations, walls and columns. From that time the number of distinctively high office-buildings increased rapidly. Other inventions followed, though as a matter of history the iron rail and concrete foundation (now nicknamed the "floating" foundation) was first used under the same building. It was one of the accidents of my life that I supplied both.

The steel skeleton having become an accepted fact, heavy walls, both exterior and interior, have been practically abolished. The earliest high office-buildings had not only exterior but interior walls of brick wherever the conditions of the plan would make their use practicable. In addition they were filled with stacks of heavy brick vaults which were permanent fixtures placed where it was supposed there would be a demand for them. Tenants had to select such quarters as suited them, according to the original plan of the building, as changes in plans were very expensive and often impracticable. But when the all-steel skeleton abolished the heavy wall it also abolished the vault, and in abolishing the vault it warned all concerned that the fireproof qualities must be of such a high grade that the whole building would be a fireproof vault. So the fireproof closet had its birth. This was one stimulus to a greater study of fireproofing conditions.

The Best Fireproof Material.

I am aware that it is contended by many men of your profession that concrete in combination with metal is a better fireproof material for constructive purposes than hollow building tile. I agree with you that in some cases it is, and therefore will not seek to provoke discussion. But the fact remains that the hollow building tile made of refractory clay is the material which has actually developed the high office-building as we find to-day, add I think it will always hold the most important place in such constructions. For while the common brick has been to a great extent supplanted, the wall and the arch have not gone out of use. The wall has only been reduced in thickness and in weight, and the weight of it has been reduced in greater proportion than the thickness. Long walls and high walls unsupported are no longer necessary, but they cover just as many superficial feet in height and breadth as before. The mason with his trowel is just as necessary; and while there are many ingenious methods for constructing subsidiary partitions without hollow tiles and without the help of the mason, there is still no way known for building the exterior walls or the main interior division walls of a building with the greatest rapidity in all kinds of weather and without the use of unnecessary quantities of water except with previously prepared dry blocks of refractory material, and of such only are the hollow tiles of burnt clay. Where an arch of large span is required, whether it be a large door, a dome or a wide span between deep floor beams, there has not yet been invented anything that is lighter for the work required, drier, more fireproof, more rapidly constructed and cheaper than the products of fireclay set in good cement. Yet there are substitutes, and they have their value, and for special purposes are desirable.

The special qualities and true value of this material and the kinds that are most reliable for fireproofing purposes will be considered when the conditions affecting a truly fireproof office-building are considered.

The main conditions to be considered are (1) the plan, (2) the materials, and (3) the constructive methods.

The plan belongs to the architect, and if he consults his engineer it will be a very simple one. It is safe to say that the best planned office-building on a rectangular lot will be one that is worked out on a system of smaller rectangles into which the lot is subdivided, with a column at each intersection. The main thing to do is to ascertain the best proportionate dimensions for these rectangles. If they are all the same there

* A paper read before the Engineers' Society of Western Pennsylvania, Pittsburg U.S.A.

will be only two dimensions for all the girders and beams in the building. Such an arrangement will result from making several sketch plans upon different subdivisions into rectangles until the best one is discovered. If this is found to be impracticable the system should be abandoned; but if possible the girders should be in straight lines, and the width of the exterior bays should be controlled by the spacing of interior columns.

Planning against Fire.

The general dispositions of the plan being adopted, the next thing to do (and one which few architects ever consider) is to study all the contingencies that would permit fire to attack such a plan from without or invade it within. Every high office-building is by its nature a flue, and the problem has hitherto been how to make it less so. So many have despaired of this that I am inclined to say that what might be possible in a great warehouse, in which vertical draughts can be avoided, need not be thought of lest the true value of the building as an investment be destroyed.

I would therefore advise that the natural flue conditions of a high office-building be improved by planning it so that the natural draughts which carry fire upward will as far as possible be directed away from the inhabited rooms and allowed to escape harmlessly through the top of the building. This can be accomplished by permanent flues built of double air-space hollow tiles running through the offices where they are least likely to interfere with future changes of partitions. These flues can be covered at the top with skylights of thin glass, which would break in case of fire, while permanent capped pipes, also at the top, would serve for ordinary ventilation. The openings from the offices into these shafts should be permanent and close to the ceilings. Such flues would carry fire and smoke through the roof and prevent it from spreading laterally.

Covered Courts and Lift Wells.

Large glass-covered courts should be avoided, as they tend to carry smoke and fire to upper storeys and smother the occupants. As elevators may become as valuable as stairways for means of escape, they should if possible be placed not in one stack but in two, and as far apart as practicable. In large buildings this would be a convenience to tenants in reaching their rooms expeditiously.

Every large office-building should have two entrances connected by a common hallway, and it is equally important that it should have two stairways from the second storey to the top and as far apart as possible. They should not be in position where a rising current of air can involve both a stairway and a stack of elevators.

Theorists have sometimes claimed that stairways and elevators should be individually isolated. Such a disposition would so injure the value of the investment that it should not be considered. Besides, an isolated stairway in case of a panic would be unknown to most af the occupants or visitors to such a building. With two vertical stacks of stairways and two vertical stacks of elevators, all connecting with corridors, it would be practicable to place spring-doors across the corridors which would isolate each stairway and each stack of elevators. Such cut-offs in the corridors should be entirely made of light metal frames and polished wire glass. This latter material will also be considered later on in connection with materials and construction, but as part of the plan of the roof it should take an important place. There are many instances in which the study of the natural action of fire in the top of a building shows that it is desirable to use glass that will break as soon as attacked by fire, so as to let the flames and smoke escape.

Ordinary and Wired Glass.

The indiscriminate use of wired glass, therefore, because it will admit light and still resist a current of fire is not to be encouraged, and it is easy to see that it might be the cause of many deaths from the accumulation of smoke which cannot escape. It is much more important that skylights should be of breakable glass, and to prevent injury caused by its fall they should have wire nets suspended beneath them. There should be such skylights over every elevator and every stairway, and if skylights are not required over them, as in the case of their being next to outer walls with windows, they should have large ventilators running through the roofs.

Any suggestions as to the capacityof elevators, stairways, corridors and doors seems hardly necessary here, for they are the important considerations which enter into the planning of every building, and are equally if not more important in a high office building than any other. The objects of a properly built high office-building other than the interest of the owner as an investment are safety to human lives and safety to the property contained in the building, as well as the building itself, as against fire.

This brings us to the second consideration —materials. That such a building must consist of fireproof materials re-enforced with the commonly accepted steel frame has been said. For the exterior, terra-cotta and brick take first place, but these are not necessarily backed with brick. Where they are not, the only material that has been used successfully is hollow fireclay tile. I have never yet heard it suggested that such materials as

ELECTRA HOUSE, FINSBURY PAVEMENT, E.C. JOHN BELCHER, A.R.A., ARCHITECT.

concrete or hollow plaster blocks should be used.

Methods of Protecting Columns and Girders.

It is now customary in the best buildings to construct the floors and protect the columns and girders before the exterior is covered. The exterior walls are not sufficient to protect the exposed columns and beams at the outer line of the structure. They are only a mask and may fall away, exposing the structure. These columns and girders should be first protected exactly as are those of the interior. Various methods are in use. By some it is advocated that they should be encased in Portland-cement concrete, completely buried in it, but it is not suggested that any fastening is required other than the adhesion of the cement to the steel and its own monolithic character. This method denies the necessity for any non-conducting air spaces. I know of only one building in which this was ever done; it was owned by a fire insurance company in New York, and it was done twenty years ago. The columns, which were of the Phœnix pattern, were covered with Portland cement run from a cornice mold and showing a moulded finish all around.

By others it is proposed to plaster the columns with cement on a lathing of wire or other perforated metal, and where one process like this is not considered sufficient it is proposed to repeat it twice and even thrice. This is frequently done, and its chief merit is its cheapness. The common method is to build hollow-tile blocks around the columns like a wall, and in some cases two courses of these are used. In severe fires which have occurred in several buildings it has been demonstrated that the exterior layers of these crack, for the reason that the exterior expands, while the interior is cool.

Defects of Hollow Tiles.

The worst defect in the use of hollow tile around columns is that no provision is made for longitudinal expansion. They are built from the girder of one storey to the girder next above. As a result it was demonstrated in the last fire that occurred in the Horne Department Store at Pittsburg that before the steel columns had absorbed enough heat to cause expansion the hollow-tile coverings were so badly crimped by expansion against the unyielding girders that many of them fell off. In an earlier fire in the Horne Office Building at Pittsburg, in 1897, the column coverings, which were of thick slabs of semi-porous terra-cotta built as a wall around them, were uninjured.

My earliest practice was to use solid blocks of a very high grade of porous terra-cotta both for columns and girders. For column coverings I always secured them to the iron with tap screws. For girders I made the blocks to fit the sections of I-beams, and found that no fastenings were needed, for the form of the I-beam is such as to hold the blocks tight between the flanges when well bedded in cement. Cast-iron columns, covered with porous terra-cotta 2½in. fastened to the iron with tap screws, were tested in a fire in the Grannis Block at Chicago in 1885, where they were pulled out of the ruins with all the fireproofing attached. There was nothing fireproof in that building except the columns.

I am now satisfied from experience of all the known materials in actual fires that the softness of porous terra-cotta is almost as objectionable as the brittleness of hard-burnt, thin-bodied tiles, and that the best fireproof material is the medium between them, and that is semi-porous, hollow tiles with walls at least ¾in. thick. The best illustration of their efficiency was seen in the Horne Office Building at Pittsburg in 1897, the material having been made in that same city.

JOHN BELCHER, A.R.A. ARCHITECT.

Clays.

Whenever a contract is let for the fireproofing of a building with clay products, the lowest contractor who secures the contract executes it with the kind of material he can make to the best advantage—it is the product of the clay he happens to mine. It may be suitable for the high-grade porous material or only for hard-burnt tile. But the best material to produce the results above suggested can only be made by mixing clays—in their natural state they are not suitable. This should be a subject for investigation and study by every manufacturer, so that a reasonably uniform standard article can be produced. Some clays may resist heat, but lack toughness; they become brittle and are not fit for hollow tiles with thin walls. Others again can be burned with large quantities of sawdust, and are wonderful non-conductors, but are too soft and not suitable for resisting severe strains. My own observation has shown that in most localities shales may be obtained which, when ground and burned with low-grade fireclays, produce the best material for semi-porous terra-cotta.

Too little attention has heretofore been given to standard qualities in burnt-clay fireproofing. When a standard is established, recognized and insisted upon by architects, there will be some hope for uniformity in results. As it is, there may be several kinds of burnt-clay fireproofing used in one city, and I know of some buildings in which the clay used was not above the grade required for ordinary flower pots. Where used, however, it was the result of indiscriminate competition and want of investigation. As a matter of fact most of the buildings fireproofed with burnt clay contain the highest grade of material. But the world will never see this fact demonstrated by the ravages of fire. It has never given the fireproof office buildings that have been erected within the last fifteen years the credit that is due them, and it never will. It only hears of the occasional one that shows failure in a crucial test. Those that have resisted the elements are dismissed with a paragraph. An occasional failure is not a demonstration that others may be expected. When it betrays the fault or the weakness it should be an object-lesson that is profitable. I regret, however, that this is not always the case.

The value of wired glass has been referred to. In an office building it will prove to have its greatest value when used in vertical positions where glass is necessary. It should also be used in all external windows wherever possible. But it should always be set in metallic sashes and frames. The supposed necessity for using wood in partitions, for door and window frames, has led to many demonstrations of the fact that this use has helped to destroy the efficiency of the fireproof materials of which they have been constructed.

UNITARIAN FREE CHURCH HALL, LONDON ROAD, READING. W. JANE, ARCHITECT.

Experience has also shown that wood should be practically abolished from the interior finish of office buildings, and this can be done now without raising any objections on the part of the tenants. Recent inventions have supplied all that is wanted. There is no longer any necessity for wooden floors. Notwithstanding it has been claimed that they will not burn, they do burn, and the oil and varnish which saturate the modern hardwood floors carry fire with great rapidity. The tenants have already anticipated the change, for they have abolished carpets and substituted rugs. If marble and tile are too expensive for floors, cement can be used. Doors need no longer be made of varnished wood, but of common wood covered with sheet brass and hung to metallic frames built in fireproof partitions.

Referring now to the third division of my subject—constructive methods—I feel compelled to tread my path with caution, for I may be invading the domain of the C.E. All discussion of constructive methods in fireproofing seems to lead to the building of floors, and this is where the C.E. has crossed the path of the architect more than once. The fact that extraordinary strength has been developed in constructions in which various combinations of Portland cement, sand and steel have entered, has made them very attractive to gentlemen of your profession.

I admit the strength and the ability to prevent fire from passing from one storey to another within a given time, and to one who seeks only for these results they are satisfactory. But house building has many ramifications.

Influences of Time and Climate.

The conditions under which houses are built are various. Among the most important of these are *time* and *climate*. Another is permanence. The oldest of the indestructible manufactured materials known to exist on the face of the earth is burnt clay. Time may show that the high grades of cement made at the present day come next to it, but we cannot wait for the outcome Finely divided steel, with which it is combined, is a very delicate material, and scientists all over the world are discussing the question "What is the best material to paint steel with?"—even where it is used in heavy members of construction. At such a time you will see if you look at nearly all of the high office-buildings that have been erected and are now being erected, that the architects who have to do with those buildings pin their faith to burnt clay. They have no time to wait and see whether the cement will eat the steel or preserve it, but they know that they have a good thing in clay, and as long as it is the only material which makes possible the building of furnaces in which iron can be made into steel, they will continue to build it up around the steel skeleton; and I hope it will preserve the steel skeleton for all time. For as the steel must be protected from fire and every inch of it covered, it is certain that when protected from one element it will be found to be pretty well clothed against the storms that try to beat against it and the insidious dampness that steam heat expels. However, I suppose that the discussion about corrosion will last until we have steam-heated bridges, and about electrolysis as long as we have damp cellars.

I have said that the architect will always be a believer in *the brick* and its substitutes, and his affection will always cling to his brother, the mason, even though houses may be built without heavy walls. With these materials and his skilful assistants he does not fear that terrible enemy to cement, Jack Frost, and he can get his work done fast enough to uit his client, which is saying a great deal. These are the convincing arguments for the use of burnt clay. My only plea is that this most important and universal material may be in the future the object of greater study for the purpose held in view in this paper; that as much investigation and experimentation will be devoted to the determination of the proper methods for manufacturing of clay products into fireproofing material as has been given to the adaptation of clay for use in the manufacture of steel. Its indestructibility is admitted; but it has a different office to perform in the burning building from what it has in the open hearth furnace. It can be made, for it has been made, to withstand water as well as fire. By proper mechanical means it can be made to keep its place under all conditions. It has also a field in constructive work such as has been developed by no other material, in the building of domes such as those erected by Guastavino. Whatever apparent failures there may have been in this as a fireproofing material are exceptions to the general practice that has been followed in its use, and only serve as a warning against its unscientific and unpractical application.

Unitarian Free Church Hall, London Road, Reading.—This hall, which was opened recently by the Mayor of Reading, consists of a spacious room with two classrooms, and lavatories and cloakrooms. The building is of red bricks with tiled roof. The floors are of wood block. The architect is Mr. W. Jane, of Reading and Weston-super-Mare, and the contractor Mr. F. Newberry, of Reading.

UNITARIAN FREE CHURCH HALL LONDON ROAD. READING. W. JANE, ARCHITECT.

Masters and Men.

The Dispute at Burton between the stonemasons and their employers still remains unsettled, neither party being willing to give in. As a consequence of the strike the work at the parish church and the new All Saints' Church is at a standstill.

The Carpenters and Joiners' Society shows in its monthly report just over 2⅛ per cent. on out of work benefit throughout the organisation. During the month two new branches have been opened. Negotiations are still in progress with the object of bringing about if possible an amalgamation of the various joiners' trade unions.

Labour in July.—The Labour Department of the Board of Trade reports that employment in July shows little change on the whole as compared with June. There has been a slight recovery in the metal trades, but employment in these industries is still worse than a year ago. In the 222 trade unions, with an aggregate membership of 550,169, making returns, 21,859 (or 4·0 per cent.) were reported as unemployed at the end of July, as compared with 4·2 per cent. in June, and 3·4 per cent. in the 216 unions, with a membership of 539,422, from which returns were received for July, 1901. The mean percentage of unemployed returned at the end of July during the ten years 1892-1901 was 4·1. Employment in the building trades continues dull, and is generally not so good as a year ago. It is fairly good with masons, slack with bricklayers, bad with painters and plasterers. The percentage of unemployed union members among carpenters at the end of July was 2·9, compared with 3·0 at the end of June, and 2·8 in July, 1901. The percentage for plumbers was 6·5, compared with 5·5 at the end of June and 6·3 for July, 1901. The changes in rates of wages reported during July affected 293,911 workpeople, and the nett effect of all the changes was a decrease averaging 7½d. weekly per head of those affected. Of the total number, 15,631 received advances, and 278,280 sustained decreases. The changes of the previous month affected 343,486 workpeople, the nett result being a decrease, averaging 1s. 9¼d. weekly per head. During July, 1901, the number affected was 272,768, and the nett weekly result was a decrease of 1s. 1¼d. per head. The principal advances reported during the month affected 6,400 ironstone miners in Cleveland, 1,500 limestone quarrymen, &c., in Weardale, 3,500 blast furnacemen in Scotland, and 1,140 steelworkers at Eston. Two changes, affecting about 123,000 workpeople, were arranged by Conciliation Boards, and seven changes, affecting about 141,000 workpeople, took effect under the sliding scales. One change, affecting 350 workpeople, was preceded by a dispute causing stoppage of work, and the remainder, affecting about 29,500 workpeople, were arranged directly between employers and workpeople or their representatives. Twenty-five fresh disputes began in July, involving 104,642 workpeople, of whom 17,907 were directly and 86,735 indirectly affected. The corresponding number of disputes in June was 11, affecting 10,679 workpeople, and in July, 1901, 28, affecting 8,148 workpeople. Of the new disputes in July, 1902, one took place in the building trade, 13 in the mining industry, and 4 in the metal, engineering and shipbuilding trades. Of the 20 new and old disputes, affecting 103,191 workpeople, of which definite results were reported, 1, affecting 340 workpeople, was decided in favour of the workpeople; 15, affecting 5,517 workpeople, in favour of the employers; and 4, affecting 97,334 workpeople, were compromised.

New Patents.

These patents are open to opposition until September 23rd.

1901.—Door Bolts. — 14,425. R. Powell, 3, Bartholomew Road, Birmingham. The bolt is folded from sheet metal and placed in the shoot on the base plate. To allow this to be done, the latter is bent at any angle; after the bolt is in position the base plate is pushed up flat. There is thus no necessity to rivet a stop for the bolt, all being folded.

Concrete Roofs, &c.—16,400. T. Potter, 5, Outram Road, Croydon. To support the centering, hangers of **Z** form are employed, hung on the walls. Another improvement consists in inserting metal channels under the joints of the concrete for the purpose of carrying away water. Over the centre of the channels are strips of zinc or other material for dividing the concrete into sections, thus allowing for expansion and contraction.

1902.—Cold Storage.—3,504. L. Mantel, National Liberal Club, Whitehall Place, London, S.W.; W. T. Prim, 80, Worple Road, Wimbledon; and J. Keith & Blackman Co., Ltd., 27, Farringdon Avenue, London, E.C. By an arrangement of channels and valves a positive circulation of dry cold air is secured. Means are also provided for the circulation of moist air when required, for getting rid of vitiated air, and for automatically obtaining a supply of fresh air.

Imitation Marble. — 9,431. S. Weill, Trierertrasse 14, St. Johann a.d. Saar, Germany. The process consists in mixing anhydrous alum and gypsum with water so as to form a dough and then kneading this with a suitable colouring matter.

Fixing Iron Railings.—11,617. F. G. Oldenburg, 12, Eimsbüttelerstrasse, Altona, Hamburg. This invention relates to a tool which enables one man to do the work of two. The tool consists of a kind of vice which holds the bars in place whilst they are being caulked.

The following specifications were published on Thursday last, and are open to opposition until September 30th. The names in italics are those of communicators of inventions. A summary of the more important of them will be given next week.

1901. — 8,385, Marles & Butt, feed-mechanism for wood moulding and carving machines. 12,764, Oakland & Oakland, drying bricks. 14,721, Ellis, locks. 15,163, Cundall, sheet metal plates for wall coverings. 15,284, Biggs, sanitary pipe joints. 16,200, Nentwig, toy building materials. 17,467, Keith & Wardle, ventilating apartments. 17,734, Kelsey *(Pelzer & Co.)*, appliances for actuating goods lifts on the coin-freed system. 18,345, Aufort, tunnel kilns. 18,453, Innes, lavatory stands. 18,511, Merryweather, ladders. 18,605, Tümler, Venetian blinds. 18,768, Bailey, valve seatings. 18,770, Innes, brackets for cisterns. 18,956, Seilheimer, heating buildings, &c. 19,183, Rennie, plumbers' traps. 22,081, Cussen, distemper wash or water paint. 25,400, Boult *(Baumann)*, heating apparatus for asphalt, bitumen, &c.

1902. — 9,297, Lake *(Warren)*, making roads, pavements, &c. 9,965, Marcus, apparatus for conveying material. 10,810, Vennesla, pump. 11,322, Ford, method of building subaqueous foundations. 11,498, Weeks, apparatus for generating acetylene gas. 12,408, Stenner, jr., & Stenner, three-speed feeding gear for rack saw benches. 13,146, Adams, combined bath and lavatory basin. 13,720, Simpson & Simpson, fixing tiles. 14,039, Ellam, means for guiding in using stencil paper. 14,142, Winterflood, water heaters. 14,332, Haddan *(Bullard, Penty, Lynch & Dorer)*, spring butt hinges.

Builders' Notes.

Mr. James Hurley Gillingham, of Bishopston, Bristol, died recently at the age of fifty-two years. Deceased, with his two brothers, managed the business of house decorators, &c., in Stokes Croft, established by his father.

Mr. James Watterston, builder, of Forfar, died recently at the age of eighty-three years. He was a native of Forfar, where for almost half a century he had carried on an extensive business as a builder. During his lifetime he executed some important contracts, including the National Bank, Canmore Works, &c. Four of his sons are builders.

The Stonework in Glasgow Municipal Buildings. — At a recent meeting of the Glasgow Town Council Mr. W. F. Anderson asked some explanation as to the expenditure on repairing the outside walls of the municipal buildings, as to which the city engineer reported that "while it is quite unsafe to express any opinion as to the ultimate cost of eradicating the decay of the stonework, and covering the restored surfaces with preservative solution, it does not appear probable that what has been already done represents more than one-fourth of the entire work." The cost up to the present has been £2,400. The Municipal Buildings Committee were instructed to prepare a statement on the subject.

Hamilton Building By-laws.—At a recent meeting of Hamilton Town Council it was moved that it be an instruction to the Dean of Guild Court to enforce part 12 of schedule 4 of the Police Act, 1892. It was explained that at present the Court were permitting partitions round the chimneys of dwelling-houses of 18in., instead of 27in. as prescribed in the Act, and that his object was to put the committee on the housing of the working classes on an equal position with private builders. It was stated that the clause dealt with building conditions in England, which were inapplicable to Scotland, and that the provision had slipped into the Act. Bailie Pollock, Dean of Guild, defended the action of the Dean of Guild Court in sanctioning 18in. partitions, and questioned the right of the Town Council to review their action. Provost Keith ruled that it was the the duty of the Council to see that the Dean of Guild Court carried out the law. The motion was carried by nine to four, one member declining to vote.

Workmen's Compensation: Home Office Report.—The Home Office has issued statistics of proceedings under the Workmen's Compensation Acts, 1897 and 1900, and the Employers' Liability Act, 1880, during last year. It is stated in the general conclusion that the number of appeals on questions of law has diminished considerably, and there seems, therefore, reason to hope that progress has been made towards the definite settlement of the legal difficulties in the interpretation of the Act of 1897. On the other hand, the number of cases brought to the county courts, in most of which it must be questions of fact that are at issue, still tends to increase; but even in view of this increase the statement must be repeated that the cases which come before the county courts do not represent more than a very small proportion of those in which compensation is paid under the Act. The great majority of claims are settled by agreement, and only a small percentage are made the subject of final arbitration. There were 437 cases brought before the county courts, 420 under the Workmen's Compensation Acts and 17 under the Employers' Liability Act.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Charges for Surveying and Plotting an Estate.

LONDON, W.—SURVEYOR writes: "I have recently surveyed an estate of 9 acres, made plan, and plotted it out for building purposes into 120 plots; also made an amended tracing and an alternative plan of portion of the estate. I have also made a tracing for lithographer for auction sale purposes of plots Nos. 1 to 46 inclusive, and have pegged out these plots, half of which have been sold, though not through me. What is the *maximum* charge I can make for this work, and is there a recognised scale?"

There is no scale which applies, as the difficulties which are met with in surveying small plots cannot be averaged. The only reasonable way of charging is by time, and as it can be absolutely substantiated by diary entries it is a method which cannot easily be defeated should the bill have to be taken into court. Principals are entitled to a *minimum* allowance of 3 guineas per diem, varying from this amount upwards, according to their status. Assistants' time is usually charged at about double their salaries, with a minimum of half-a-guinea per diem. All out of pocket expenses are chargeable, as also is time necessarily occupied in travelling.

G. A. T. M.

Plastering Brick Walls.

NORTHAMPTON.—BRICK writes: "In some dilapidations I have to attend to the salt in the bricks is causing the ordinary lime plaster to rot and fall away. I am ordered to remedy this at any cost. Can you suggest a remedy?"

Batten and lath walls, and plaster on that in the ordinary way. Plaster should not be put direct on external brick walls.

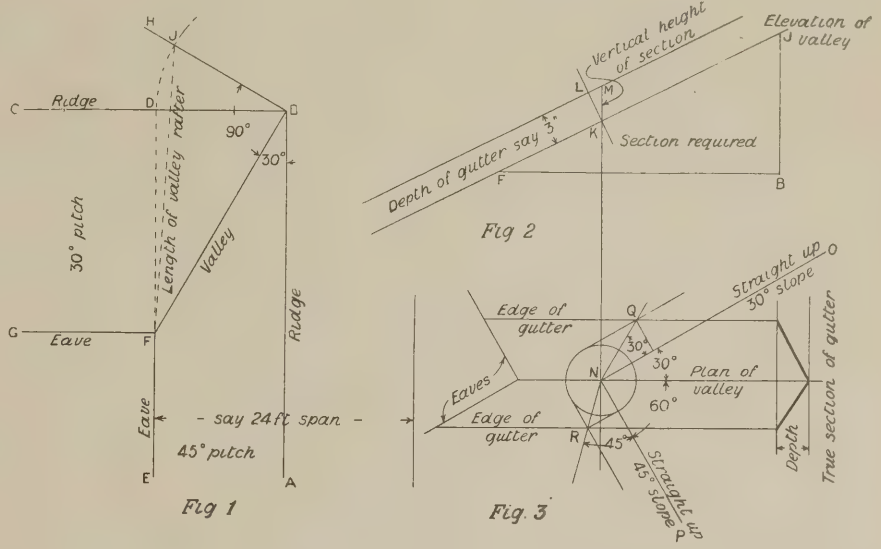
Tennis Courts.

WICKWAR, GLOUCESTER.—J. S. B. writes: "Could a satisfactory tennis court be made by levelling a thoroughly hard and dry surface, and then laying, say, 3in. thick of finely screened ashes on the top and well rolling?"

Tennis courts are often made similarly to the manner you propose, but a surface of ashes is dusty, and we advise you to use asphalt. A layer of cement is also used, but will crack unless rendered on about 6in. of concrete while the latter is "green"; it is also hard, cold, and glares strongly in the sun.

Safe Stresses in Iron and Steel.

YORK.—S. G. H. writes: "The Table XI. in Rivington's 'Building Construction,' Vol. IV., is worked out to a safe compression shearing stress of 4 tons per sq. in. for iron. When using steel, how many tons per sq. in. may be taken?"



The ordinary working stresses for wrought iron are 14,000lbs. per sq.in., and for mild steel 13,000lbs. to 16,000lbs. both in compression and tension, but for cast-iron in compression 11,000lbs. and 3,360lbs. in tension. You will therefore see that the table in Rivington does for both wrought-iron and steel, but is wasteful of material.

Valley Gutters for Roofs with Unequal Pitches.

LONDON, N.W.—GAS writes: "I have two roofs of iron covered with slates (one of 45 degs. and the other of 30 degs. pitch) intersecting. I intend to form an iron gutter-piece, as the roof is to contain nothing but iron, and I should like to know how to arrive at the section of this gutter."

Draw plan of ridge of 45-deg. roof AB, Fig. 1, and BC at right angles for ridge of 30-deg. roof. Set off BD equal to half-span of 45-deg. roof and produce through to E. Then, as BD also represents height of ridge above eaves of both roofs, from AB set off BF at an angle of 30 degs. and cutting DE in F, to represent the plan of intersecting valley, and draw FG, the other eave. From B set up BH at right angles to BF, and from B with radius BD describe an arc cutting BH in J. Join JF, and this will give the length of the valley rafter, the pitch being the angle BFJ. In Fig. 2 draw the elevation of valley corresponding to line FJ on base FB, but to a larger scale, and set up required depth of gutter. Take a point K at bottom of gutter where a section KL can be obtained. Draw plan of valley, Fig. 3, and drop vertical KN through point K, so that KM is the height of a vertical section through the gutter when in position, KL the line of an ordinary cross section, and N a point in the bottom of the gutter. From N describe a circle with KM as radius, and also from point N set off an angle of 30 degs. to the line showing plan of valley, which will represent the position of a line O passing straight up the slope of the flatter roof, and on the other side of the line set off an angle of 60 degs., which will represent the position of a line P going straight up the steep slope. Now set off an angle of 30 degs. from NO and draw a parallel tangent from circle to intersect it in point Q, also an angle of 45 degs. from line NP and a parallel tangent from circle to intersect it in R, then lines through Q and R parallel to the centre line of valley will represent the actual edges of gutter in plan. On the right-hand side of plan draw a perpendicular to intersect centre line and set up the depth of gutter, when a line parallel to the last through this height will intersect with the edges of the gutter and enable a true section to be drawn as shown by thick lines.

HENRY ADAMS.

VALLEY GUTTERS FOR ROOFS WITH UNEQUAL PITCHES.

"Ferro-Concrete."

LONDON, E.C.—A.R.I.B.A. writes: "Will the author of the highly interesting article on the above material in your issue for July 30th kindly explain how the strength of a 'ferro-concrete' beam is calculated, and also the meaning of the words on p. 388: 'The formula for calculating the influence of the moment M on a given section, at a distance y from the neutral axis $= a \frac{My}{I}$ where a represents the ratio of the co-efficients of elasticity in iron and concrete. The co-efficient of iron = 12,500 tons per sq. in., that of concrete = 12·50 tons per sq. in., therefore $a = 10$.' What is the 'influence of the moment'?"

The formula $\frac{My}{I}$ is the ordinary one used for beams, and represents the intensity of stress at any point distance y from the neutral axis. M is the bending moment, and I the moment of inertia of the section. The formula is the same as given in Hurst's Pocket-Book as $M = \frac{FI}{\delta}$ The method of using this formula for stresses in beams is given by Hurst, and also on p. 409 of our issue for June 26th, 1901. The explanation of the method by which the formula is arrived at is a long one, and we cannot spare the space here to deal with the matter. We must therefore refer our correspondent to such books as Rankine's and Perry's manuals of mechanics.

SPES (LONDON) has omitted to send us his name and address. Until this is sent we shall not answer his enquiry.

VIELLE MONTAGNE ZINC GAUGE.

UNDER this heading we published on p. 304 of our issue for June 25th last a table of thicknesses and weights of the various gauges of zinc which was slightly different from the present manufacture of the Vielle Montagne Zinc Mining Company. The correct table is as follows:—

No. of Gauge.	Approximate Thickness.	Weight per ft. super. of Sheet Zinc.
	Inches.	Oz.
1	0·004	2·31
2	·006	3·25
3	·007	3·93
4	·008	4·81

KNOSSOS AND PHAESTOS.

THE CRETAN EXPLORATIONS ALMOST COMPLETED.

ALMOST interesting communication from a special correspondent was published in last Friday's "Times" in reference to the excavations which have been carried on for some years past in Crete. The discoveries made in the island since 1890 rank among the most brilliant achievements of archæological research. The picture of a long-forgotten civilisation has been unrolled before our eyes; the frescoes, the reliefs, the sculptures not only furnish a wholly new revelation of ancient art, but bring vividly before us the life of a remote age in its domestic, civic and religious aspects; the mythical figures of Dædalus and Minos stand out in the midst of the past and are clothed with an almost historic reality. The crowning achievement, however, consists in the complete vindication of Mr. Arthur Evans's theory that two distinct systems of writing, the linear and the pictographic, were employed by the prehistoric inhabitants of the Ægean area.

The Work at Knossos and its Difficulties.

The systematic excavation of Knossos was begun by Mr. Evans in March, 1900. His efforts to investigate the site date from 1895, when he first acquired a portion of the ground by purchase; and his perseverance in the face of many obstacles has met with a rich reward. Some details remain to be worked out, and the search for tombs in the neighbourhood will be continued next year; but the great work has practically been completed. The vast prehistoric palace, extending over five acres, with its courts and halls and staircases and labyrinthine passages, stands a living witness to the fabled grandeur of the Minoan realm.

For those who have not watched the progress of the works it is not easy to realise the magnitude, the difficulty, the cost, and at times the dangers of this remarkable undertaking. Owing to the steepness of the eastern declivity a great retaining wall has been constructed in order to prevent subsidence, and the excavation of the lower floors on this side has necessitated the employment of strong wooden props and a large amount of new masonry supporting the upper storeys. The throne room and the adjacent apartments have been protected from the weather by a strong roof, covered with Santorin cement, and supported on the side of the impluvium by three new columns tapering towards the base, the design being taken from one of the frescoes found in the palace.

From a purely material point of view the palace, as it now stands, forms a valuable bequest to the Cretan community; the Candia Museum, enriched with a unique collection of frescoes, sculptures, vases and other works of art, is now one of the most interesting in Europe, while the employment of native labour—from 200 to 250 workmen have been daily engaged in the excavations—has been a boon to the town and neighbourhood, where thousands of Moslem refugees have been congregated since the last insurrection. Owing to the inadequacy of subscriptions, Mr. Evans has drawn largely on his private resources during the prosecution of the work; and in the circumstances it is somewhat disheartening to learn that his request for permission to remove a few duplicate vases and other objects to Oxford has not even met with a reply from the Cretan Government.

New Discoveries.

The principal discoveries of the past season up to the end of last April have been described in these columns. The anticipation that the remaining operations would be productive of interesting resutls has been amply fulfilled.

On the northern side of the palace, near the north-east corner, a large portico has been revealed with double rows of six columns. The portico was evidently approached by a road leading up through the neighbouring valley from the sea-coast; on the inner side a stepway communicates with the central court, the passage being flanked with bastions of huge square stones marked with tridents. This was evidently the sea-gate through which the poetic imagination may picture the Minoan sailors passing with bands of captive pirates or, it may be, a disconsolate train of Athenian youths and maidens on their way to the lair of the Minotaur.

One would gladly accept Mr. Evans's attractive idea—that in the intricate passages of the palace we find the original of the legendary Labyrinth, the haunt of the monster, and that the name is derived from the Carian *lábrus*, the double battle-axe, a sacred symbol which occurs so frequently in every part of the building. But his theory seems almost as applicable to the complicated structure at Phæstos, the other great palace now brought to light, where the double-axe, which was also a symbol in the early Cretan script, repeatedly appears as a mason's mark, alternating with other signs.

Notwithstanding the local legend, the fresco-paintings and reliefs of bulls at Knossos can scarcely be taken as imparting a special character to the palace in view of the very frequent representations of the animal in Mycenæan art; nor is it easy to abandon the older view which connects *labúrinthos* with *laúra*, an enclosed passage or alley—the name of more than one Greek monastery—and *Laúreion*, "the place of the catacombs"—the mining town in Attica.

Sewers and Drain-Pipes.

A little below the north portico is a great sewer passing into the adjoining valley. In general the sanitary arrangements at Knossos seem to rival those of our own times. Shafts from the upper storeys communicate with conduits in the basement; the drain-pipes are almost exactly similar to those recently found by Professor Dörpfeld at Lerkas, and present a wonderfully modern appearance. On the south-eastern side of the palace another portico has been discovered with six columns and a corner pier.

The Wonderful Phaestos.

The remarkable excavations carried out by the Italian archæological mission at Phæstos under the able direction of Professor Halbherr form a counterpart to Mr. Evans's great undertaking at Knossos. The works, which were begun in June, 1900, occupied three seasons, and, like those at Knossos, have now been practically concluded. The site of the ancient Homeric city, the rival of Knossos, was identified by Admiral Spratt half a century ago, though no trace of the masonry was visible except a few calcined blocks on the summit of the acropolis.

Phæstos lies almost due south of Mount Ida, at a distance of about three miles from the southern coast. The architectural lines of the palace are incomparably more striking than those of Knossos. Here also there is a large western area, or agora; the pavement is traversed by some curious slightly-raised diagonal lines, which perhaps had reference to ceremonies or games celebrated in the enclosure. The agora terminates at its northern end in a broad series of stone steps, apparently intended for an auditorium. To the west, protected by a ramp—the Homeric *hérkos*—another wide and imposing flight of steps leads up through a portico to the great hall, or *mégaron*, which measures 27·70 metres by 13·75, thus surpassing in dimensions any Mycenæan apartment yet discovered.

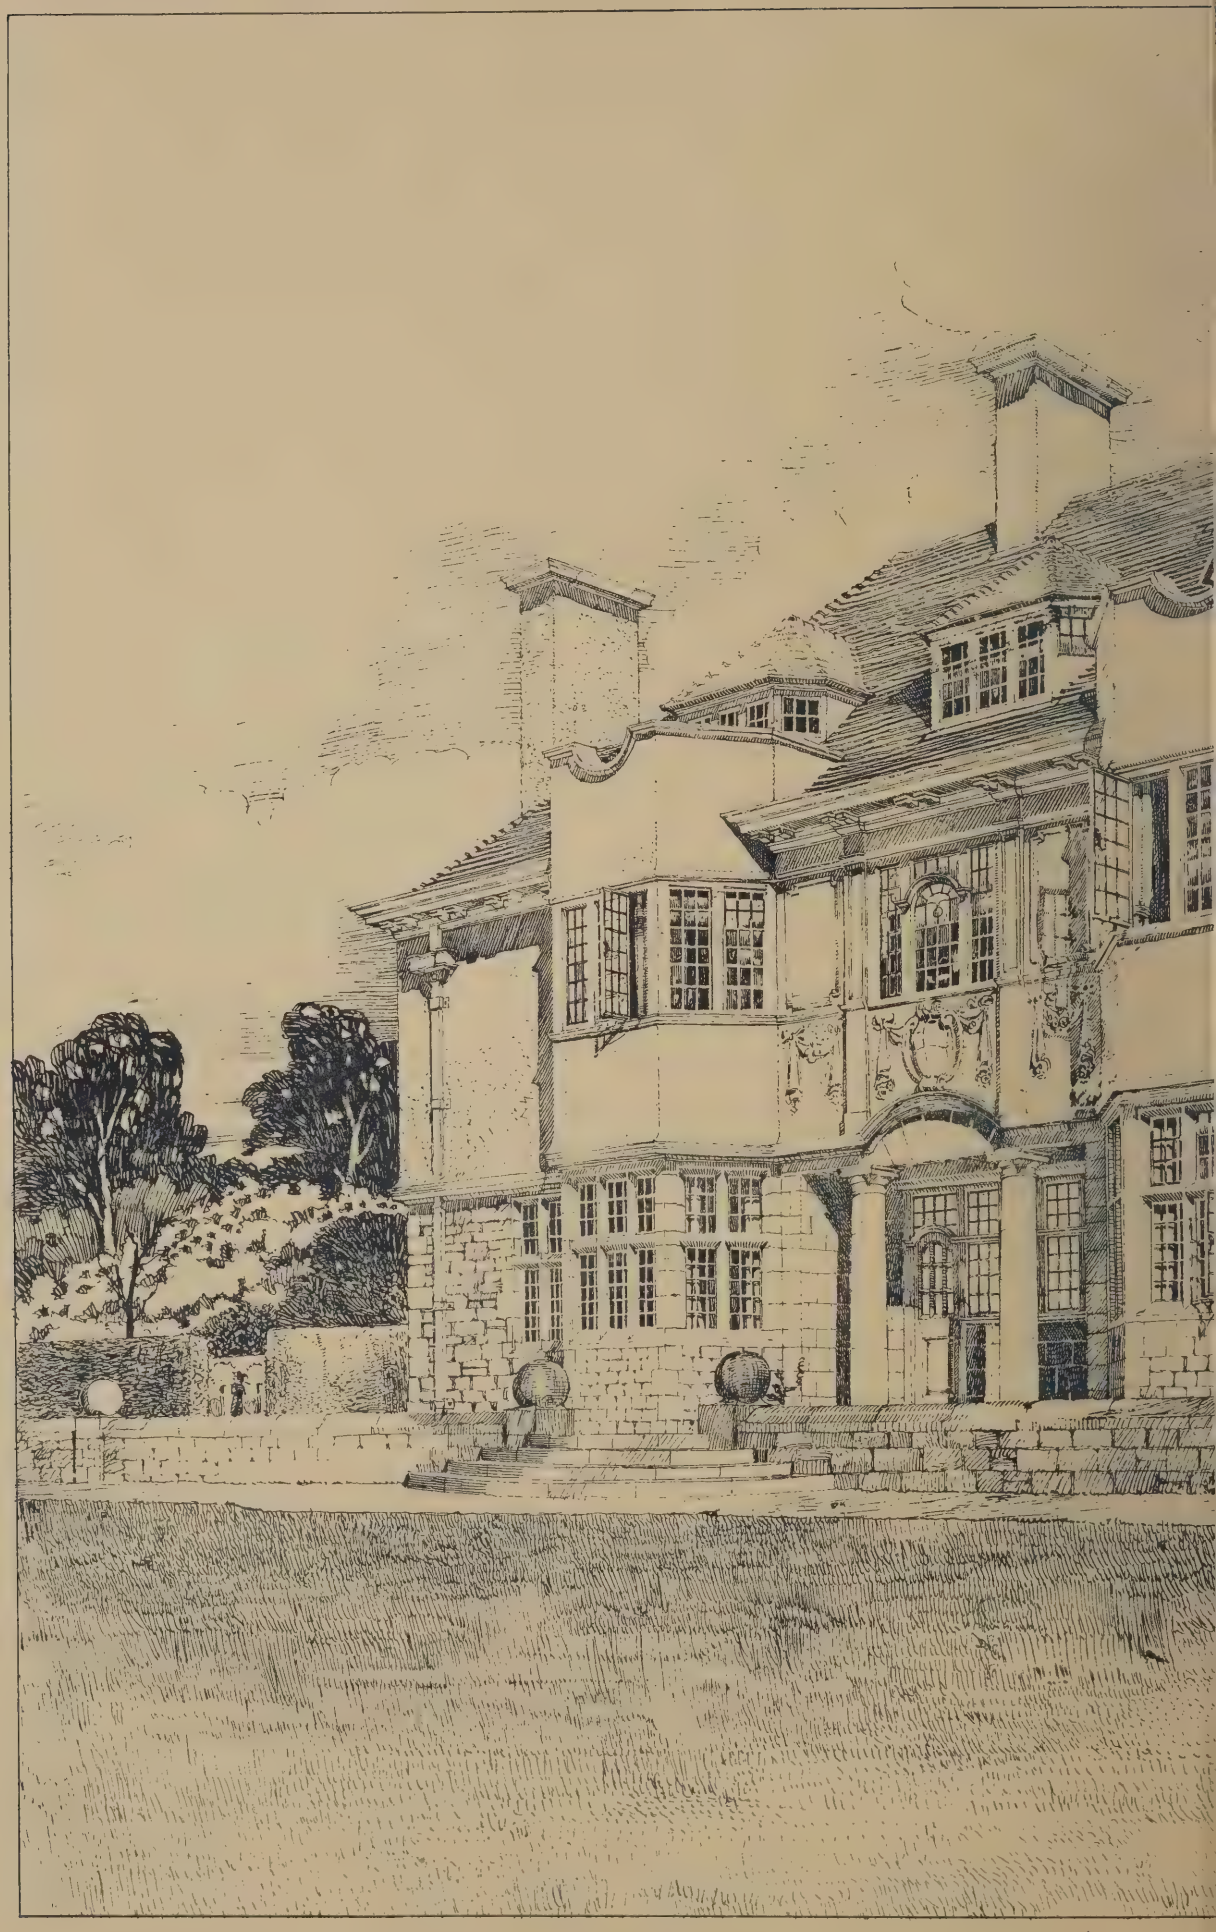
The *mégaron*, like the "Hall of the Double Axes" at Knossos, is divided into two portions—a vestibule and an inner chamber consisting of two compartments separated from each other by three columns. To the right are the store-rooms or magazines, ranged on either side of a broad corridor; in the centre a great stone pier, which apparently serves no structural purpose, may conceivably furnish another example of Mycenæan pillar cult.

From the magazines we pass through another large *mégaron* with columns, probably the hall of the men as distinguished from the women's hall in the gynæconitis, into a vast rectangular space flanked with porticos—the central court of the palace. In the whole range of Mycenæan discoveries there is nothing more imposing than this magnificent quadrangle; viewed from its southern end, with the snowy crest of Ida towering above, it possesses a strange and wonderful beauty in its present solitude and desolation.

A broad doorway to the north, with niches on either side, apparently designed as sentry-boxes for two eunuchs, leads into the gynæconitis, the women's quarter, with thalami or bedrooms, a bath, a columned *mégaron* and propylæa opening to the north. The buildings on the eastern side of the great court communicate with the gynæconitis, and are conjectured to have been the residential quarter; on the western side, separated from the magazines by a broad corridor, are a great number of small apartments, which were probably inhabited by servants.

A Comparison.

Any adequate comparison of the two great palaces of Knossos and Phæstos would be excluded by present limits. The buildings present many points of similarity in general design, architectural features, mode of construction and various details. Both sites were inhabited from the remotest times, as may be concluded from the neolithic deposits in the lowest strata. The palaces were both destroyed by fire in the Mycenæan age; but Phæstos, after a certain lapse of time, perhaps two centuries, was occupied by new settlers, of whom traces are found in courses of post-Mycenæan masonry and in pottery of the "Kurtes" type, which is transitional from the late Mycenæan to the geometric.



Mycenæan Phæstos appears to have flourished somewhat earlier than Knossos and at a period anterior to the highest perfection of Mycenæan decorative art; the paintings, for example, are more primitive and conventional than those at Knossos, which abound in subjects taken from nature and real life. On the other hand the structural magnificence of Phæstos—largely attributable, of course, to the greater capabilities of the site—the contemporaneous employment of the older Cyclopean style with the use of squared blocks, the judicious selection of local and foreign material, and the combination of solidity with elegance bear witness to the fullest development of Mycenæan architectural science.

Other Researches.

Professor Halbherr's brilliant discovery of another Mycenæan palace at Hagla Triáda (more correctly Hagia Trias), a few miles to the west of Phæstos, may be described as the sensational event of the past season. The palace stood on a picturesque hill top overlooking the alluvial plain. The excavations have yielded results which give promise of a rich series of discoveries during next year's campaign.

To the researches carried out by Miss Boyd at Gourniá and by Mr. R. C. Bosanquet at Palæócastro only a few words can be allotted, though both are deserving of a fuller description. Many interesting objects have been discovered, and, what is more important, a sensible addition has been made to our knowledge of Mycenæan domestic architecture

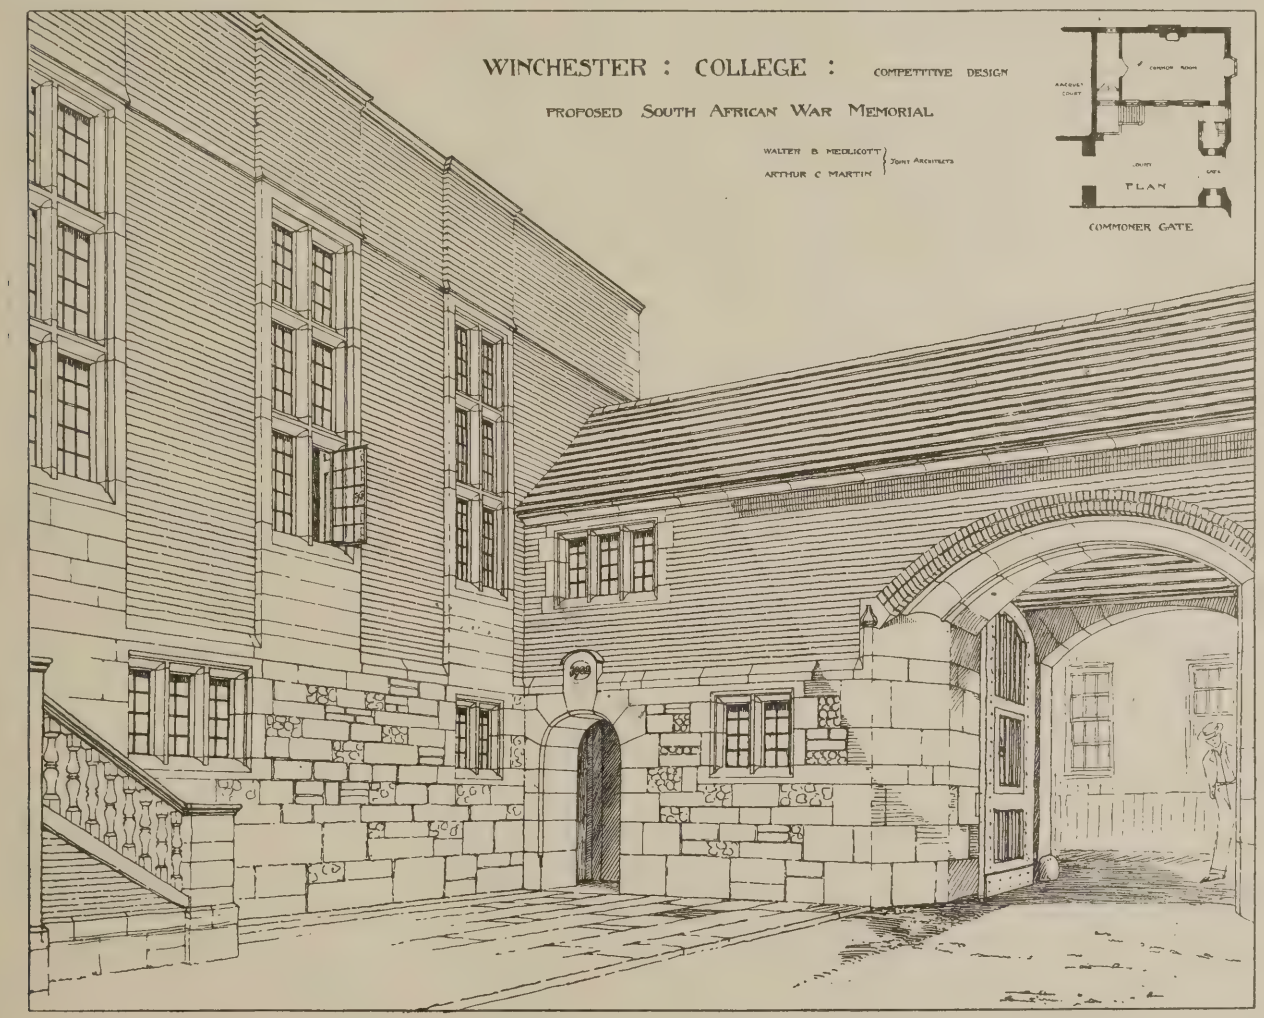
owing to the excellent preservation of some of the buildings.



The excavations at Palæócastro will be continued next year should the requisite funds be forthcoming. For the works carried out by Mr. Bosanquet this season the modest sum of £150 was all that was available. It must be remembered that while foreign Governments liberally support their several scientific missions in Crete and elsewhere, British archæological enterprise is entirely dependent on voluntary contributions.

ANOTHER FIRE-TEST.

A NEW FIRE-RESISTING MATERIAL.

ON Wednesday last some fire-tests were made at the works of the British Uralite Co., in the neighbourhood of Higham and Rochester, Kent. The material was invented by Colonel Imchenetsky, of the Russian Artillery, and about two years ago the company secured the right to manufacture it in this country. The main ingredient of the substance is asbestos, which is sent from Canada, the United States, and Ural mountains in Russia. This is cleansed and afterwards mixed with water and chalk, as a binding agent, into a pulp similar to that of paper pulp. The pulp is rolled into sheets. The sheets thus formed are cut into the sizes required, pressed and dried, leaving boards of fibrous asbestos. These boards are steeped in a solution of silicate of soda; the water is driven off by drying, and they are then dipped in a solution of bicarbonate of soda and again dried. The technical application consists of the impregnation of the asbestos board by silicate of soda and its subsequent decomposition by bicarbonate of soda. This is accomplished by regulating the strength of the two solutions so as to ensure the complete impregnation of the whole of the board by the two chemicals, which are of mineral character. In this way the time of deposition is determined, and, after a sufficiency of the colloid silica is deposited over the fibres of the asbestos, it is gradually dried until the 75 per cent. of water, natural to freshly formed colloid silica, is driven off, leaving a hard dense substance which attaches itself as a cement to the asbestos and thus forms a homogeneous mass incapable of lamination, with no planes of cleavage, and fire-resisting to a high degree.

In order to carry out the tests a small house, a hut and a platform were utilized. To the test-house were fixed four doors. One door was constructed with two oak boards ¾in. thick. Next to the timber was a steel armour plate and over all was a covering of Uralite. The second door, suitable for inside use, was built of two sheets of hard Uralite running through the centre of the door and forming panels. The framework consisted of timber laid on either side. A door for warehouse purposes consisted of a thickness of soft Uralite in the centre and oak on either side. Next to the timber was fixed a thickness of soft Uralite, and the whole was covered by a layer of hard Uralite. The stiles of the other door were constructed of oak 1½in. thick, and the panels were filled in with Uralite mortar thoroughly dried. The timber was covered all over with soft Uralite and on that a steel armour was fixed. The whole was covered by hard Uralite. In each case the materials were fixed together by means of nails. A fire was lighted inside the house and the doors were shut. The highest temperature reached was 2,350 degs. Fahr. After the test, it was found that in each case the doors had resisted the fire. It is interesting to note, however, that in the case of the second door practically all the wood outside was burnt off leaving the outer layer of Uralite uninjured by the severe heat. The fire was burning for an hour. In the hut was fixed a deed-box made of Uralite and wood, and in the box were placed some papers, a book and a crucible containing paraffin wax. After being subjected to an external heat of 2,030 degs. Fahr., the papers and book were not in the slightest degree charred. The wood nearest the fire was charred right through, but the middle layer of Uralite was sound and the paraffin wax had only melted. The platform was 12ft. long and 6ft wide; it was built of wood, but one-half was covered with Uralite. After the fire had burnt underneath it and had reached 2,270 degs. Fahr., the unprotected portion was completely destroyed, but that covered with Uralite was whole and strong enough to stand the weight of a man.

Proposed War Memorial, Winchester College.—This scheme was for a new "Commoner Gate," with which was combined a common-room for those possessing caps for cricket, football, &c., to be parallel with the prefects' common-room already existing. In this room the names of all who served at the front were to be inlaid in the oak panelling, the names of those who had fallen also being placed in the chapel or cloisters. Underneath were provided an armoury for rifle corps and the armourers' quarters, which were to serve also as a porter's lodge. The materials were to be small bricks, stone dressings, and stone and flint base to match the existing old "Meads" wall forming the south side of the small court. Messrs. Walter B. Medlicott and Arthur C. Martin were the joint architects. The drawing was hung in this year's Academy Exhibition.

Keystones.

The Portland Stone in Newgate Prison is to be re-used in the building of the new Session House.

A New Hospital at Aldershot has been erected at a cost of about £2,600, with an additional £100 for laying out the grounds. The architect was Mr. T. Davison, A.R.I.B.A., whose plans were selected in open competition.

A New Sunday School at Tuebrook is being erected in connection with Christ Church in Buckingham Road. The building will accommodate 250 scholars. It will be of brick, with class-rooms, in addition to a large main room. Mr. Harding is the architect, and the builders are Messrs. W. Caird & Son. It will cost about £400.

An Ecclesiastical and Educational Art Exhibition is proposed to be formed in connection with the forthcoming Church Congress at Northampton. If any of our readers care to lend any objects of interest they should send a short description of them as early as possible to the Rev. J. E. Hopkins, hon. sec., St. Edmund's Vicarage, Northampton, so that arrangements may be made for their proper display.

The Colonies and the Victoria Memorial.—The Colonies have intimated their intention of contributing handsome sums towards the National Memorial in commemoration of Queen Victoria in the capital of the Empire. The total contribution of the self-governing Colonies alone will probably exceed £100,000. Already for this purpose Canada has promised a contribution of £30,000; Cape Colony, £20,000; New Zealand, not less than £15,000; and Natal, £10,000.

A New Sunday School at Askam has been erected in Beach Street. The building gives accommodation for about 200 children. It is built with Askam bricks and roofed with Kirkby slate. The building is divided into three class-rooms with swivel partitions. There is also a separate yard for boys and girls, with an underground cellar and heating chamber combined. For special occasions the largest class-room can be thrown into the chapel, and 100 more persons would thus be found seating room. The architect was Mr. Richardson, of Dalton. The contract has been well carried out by Mr. George Martin, of Dalton.

Chelsea Polytechnic Examination.—The result of the examination of the University Extension Lecture on the History of Architecture, held at the Chelsea Polytechnic last session has just been announced as follows:—J. G. Wiles, G. Wilson and A. C. Goulder gain certificates of distinction, and then follow H. Stewart, J. Henry, R. Crosthwaite, E. Heath, G. Gifford, A. Cooke, F. Hedges, H. Hèlin, E. Fowler and E. Topping. The lecturer was Mr. Banister Fletcher, A.R.I.B.A., and the examiner was Professor W. R. Lethaby, of the Royal College of Art. The lectures will be continued next session, the first being given on Monday, October 6th, at 7 o'clock.

Manchester Royal Infirmary: Proposal to sell the Piccadilly Site.—It is now proposed that the Board of Management of the Manchester Royal Infirmary be empowered to again negotiate the sale of the entire Piccadilly site and buildings to the Manchester Corporation for not less than £400,000; and, in the event of the City Council again refusing to purchase, that the Board be authorised to offer the site (with the sanction of the Charity Commissioners and subject to Act of Parliament) for sale publicly to the highest bidder, with a view of applying the proceeds to the erection of a new infirmary of adequate accommodation and equipment on a suitable site elsewhere.

Mr. Carnegie's offer to make a grant of £800 towards building and fitting up a public library in Criccieth, Carnarvonshire, has been accepted.

A New Parish Hall at Chirk is being erected by Mr. J. Stringer, of Sandbach, from the designs of Messrs. Greyson & Ould, of Liverpool.

To Commemorate the Coronation of their Majesties the King and Queen a stained-glass window is to be erected in the parish church at High Wycombe, known as the "Cathedral of Bucks," being the largest church in that country.

The North-West Tower of Westminster Abbey having been restored, the Dean and Chapter have now commenced the repair of the lancet and trefoil window west of the recessed portico arch on the north side, which is fretted with age and the effect of atmospheric action.

Westminster Abbey is closed to-day to the public to allow the Office of Works to proceed with the removal of the temporary erections inside and outside the building, and the taking down of the annexe during this week. The Abbey is to be restored to the custody of the Dean and Chapter by the first Sunday in October.

Albert Chapel, Windsor.—Mr. W. G. Stoneham, writing to the "Windsor Chronicle," calls attention to the fact that a creeper obliterates the beautiful tracery of the east end of the Albert Memorial Chapel. "Not only is this modern creeper rapidly covering this beautiful structure, but ivy is allowed slowly but surely to effect the same object, with the difference that the ivy is prominent winter and summer, while the leaves of the creeper fall in winter."

Failure of a Derby Architect.—The first meeting of the creditors of Mr. Frederick Charles Coultburst, architect and surveyor, of Derby, was recently held. The debtor was stated to have been in partnership with Mr. F. K. Booty until July, 1900. His statement of affairs showed that there were thirty-five unsecured creditors against his separate estate, whose claims amounted to £343 2s. 11d., three unsecured creditors against the late partnership amounting to £1,581 9s. 1d., and one partly secured creditor of £74 10s. 8d., which, less the estimated value of the securities (£50), amounted to £24 10s. 8d. The total liabilities expected to rank for dividend were £1,949 2s. 8d., and the assets amounted to £1,354 5s. After making deductions for distrainable rent, rates and taxes, a deficiency of £545 9s. 1d. was left. The debtor stated that the causes of his insolvency were losses through building property at Tunbridge Wells, and a falling off in business during the past few years.

Board School Building Construction Classes in Glasgow.—We have just received a prospectus of the evening classes in building construction that have been arranged for the session commencing Monday, September 15th at the High School of Glasgow in 30, Elmbank Street. There will be only two courses this session, first and second. A very successful feature of last session was the introduction of workshop practice in Kent Road School, which will be continued this session as a branch department of the High School, the two classes working in conjunction with one another as formerly. Mr. D. Bennet Dobson, architect, is the lecturer, and is assisted by Mr. James Barron. The teacher in the practical department is Mr. John Rennie, joiner, assisted by Mr. James M'Lean, joiner. The fees are 8s. 6d. for each course, which extend over a period of six months. Visits of inspection are arranged to principal buildings in course of erection and works in progress. Further particulars can be obtained from the Clerk for the School Board, 129, Bath Street, Glasgow.

A Granite Memorial in Victoria Park, Portsmouth, has been erected by the crew of the "Centurion" to their shipmates who fell in the Boxer rising in China.

A Memorial Brass has been erected in St. David's Cathedral in remembrance of those who died in connection with the Welsh Hospital in South Africa.

East Meon Church.—At the bottom of the third column on p. 410 of our issue for last week, eighteenth was printed instead of *thirteenth* century as the date of the Lady Chapel.

A New Workhouse Infirmary at Stockport is to be erected at Stepping Hill. The estimated cost of the new infirmary is £40,000, and the plans provide for fifty-eight beds, with an administration block.

Two Oldham Competitions.—In the competition for a new market hall and shops the design of Messrs. Leeming & Leeming, of London, has been placed first; that of Messrs. Winder & Taylor, of Oldham, second; and Messrs. A. Neill & Son, Leeds, third. In the competition for public baths, &c., the designs of Messrs. A. R. Groome & Grant, of Manchester, have been placed both first and second, and that of Messrs. H. Cheetham & Barlow, of Oldham, second.

Cardiff University College.—A meeting of the sub-committee of the Building Committee in connection with the new buildings of the University College of South Wales and Monmouthshire was held last week. After a long discussion it was decided to select the architect from the following four—Mr. Basil Champneys, Mr. W. D. Caröe, Mr. Marshall and Mr. John Belcher.

A Church Competition.—The competition recently held for the London Baptist Association Church, Mitcham Lane, Streatham, S.W., has been decided in favour of design marked "New Era," by Messrs. George Baines, F.R.I.B.A., & R. Palmer Baines, 5, Clement's Inn, Strand, W.C. The first portion of the buildings, which includes the nave, tower, vestries and temporary apse, is to be at once proceeded with. The estimated cost of the complete block is £5,238 without tower.

At Basing House, Hampshire, Lord Bolton, the owner of the ruins, has lately been excavating with a body of workmen, and has made some interesting discoveries. These comprise a gateway, the foundations of a turret with spiral staircase, a finely carved classic head, with moulding in excellent state of preservation, and a number of grotesques, which probably ornamented the house and grinned down at Queen Elizabeth and Cromwell. The foundations are so massive that it is tempting to conjecture that a grand hall of the old house once stood above them.

Glasgow School of Art.—The prospectus for next session contains little that is new. We note that there were 114 architectural students among the 723 attending the school during last session, and that ninety works in painting, sculpture and architecture were contributed by the school to the last exhibition of the Glasgow Institute of Fine Arts. Two bursaries of £10 each are offered to architectural students, and the Glasgow Institute of Architects offers two prizes (one of £3 3s. and the other of £2 2s.). There is also the "Alexander Thomson" travelling scholarship of the value of £60, offered every third year for competition among architectural students. The next competition takes place in 1905, and particulars of it can be obtained from the secretary to the Trust, Mr. C. J. MacLean, 115, St. Vincent Street, Glasgow; while any further information about the Glasgow School of Art can be had on application to the secretary, Mr. E. R. Catterns, 167, Renfrew Street, Glasgow. An exhibition of students' work will be held in the Royal Glasgow Institute of the Fine Arts from November 4th till November 17th next.

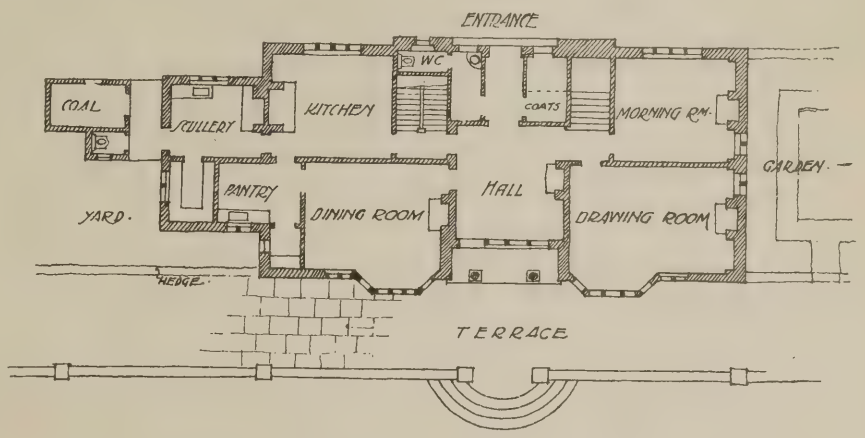
Bricks and Mortar.

Aphorism for the Week.

When architecture has arrived at such a stage of perfection that it is sanctioned by the approval of ages, any important change in it is scarcely admissible, neither is it easily effected; all the advice, therefore, to the artist . . . to emancipate himself from the trammels under which he is said to be labouring is absurd. GWILT.

Our Plates. THE drawing of the House at Oxford, designed by Mr. Henry T. Hare, F.R.I.B.A., was exhibited in this year's Royal Academy. A plan of the house is given on this page.

Ely Place. ELY PLACE, Holborn, is undergoing a small transformation so far as concerns a portion of its buildings, and the demolition of some old houses on the east side has revealed in the northern wall of the church of St. Etheldreda (sometimes called St. Audry) several architectural details of great beauty. This edifice is part of the ancient palace of the Bishops of Ely, and looking at the locality now one can scarcely imagine that not so very long ago it was famous for its orchards and lawns, of which the only relic remaining is contained in the name of the adjoining thoroughfare, Hatton Garden. The four windows which the present changes have uncovered are Gothic in style, with below them a set of smaller lights for the crypt. They were hidden by the flank wall of the adjoining house, and in a few months will no doubt be again concealed by the block of modern offices that is to rise on the site now being rapidly cleared. The beautiful and interesting church, is now a Roman Catholic place of worship.



Campaniles in England. THE recent disaster at Venice brings to mind the fact that detached belfries or campaniles were never very popular adjuncts to churches or cathedrals in this country. One of the few now left is that at Chichester, which stands in the north-west corner of the cathedral churchyard. It is a square massive structure in accord with the two western towers. There was formerly a bell-tower to the south-west of Salisbury Cathedral; it was of no great height. It was standing in the Eighteenth Century, and was pulled down for no earthly reason save sheer vandalism. Long years ago there was a campanile in the burial-ground of old Winchilsea Church, but no drawings of it exist. Of late years one or two detached towers have been erected in connection with new parish churches, as at Wilton, near Salisbury. In some cases the tower stands apart but connected to the church by a short cloister, and thus becomes semi-detached, as, for instance, that of St. James-the-Less, Westminster.

A Sky-scraper for Johannesburg. THE projected erection of a sky-scraper at Johannesburg, to be followed no doubt by other similar erections in the future, may be regarded as a Yankee triumph. The innovation has already brought a good deal of grist to the American mill in the shape of orders for steel building material, and in the event of Messrs. Eckstein's example being followed by other South African companies to any marked extent, the result will necessarily be a great stimulus to American trade. For the construction of steel-framed buildings is, of course, a peculiarly American industry. The building is to be nine storeys high, and it is calculated that its construction will occupy about two years. The complete steel framework of the building will be erected first. It is to be faced with white stone on the sides towards Commissioner Street and "'Tween Chains." The frontage towards each street is 103ft. in length. The general style of the architecture will be a free Classic treatment. The front towards Commissioner Street will have an imposing entrance. Above it on the level of the second floor there will be a stone balcony projecting about 4ft., which will be carried round the two frontages of the building. On the eighth floor level will be a bold cornice. The Commissioner Street front will be surmounted in the centre by a circular domed tower, bearing a flagstaff, whose "mast head" will be some 150ft. above pedestrians in the street below. Each angle of the building will be adorned with square projecting blocks. The frontage facing the Chains will be treated similarly to that towards Commissioner Street. The ground plan of the entire structure will be shaped like an H. The number of offices in the entire building will be over 200. Messrs. Leck & F. Emley are the architects.

Buildings in Kew Gardens. AMONG the fanciful buildings which Sir William Chambers (the architect of Somerset House) erected in Kew Gardens were the Alhambra and the Mosque, both frail structures which have long since disappeared. Of the buildings that remain, the Orangery, constructed in 1761, is now Museum III. The initials of the Princess Augusta were affixed to the building by William IV., "in grateful remembrance of her who laid the foundation of the surrounding scenes." The Pagoda was put up in 1762. All the angles of the roofs and the storeys were at the time adorned with large dragons, eighty in number, covered with a kind of thin glass of various colours, which produced a most dazzling reflection. Everybody knows the dragons are no longer there.

Swanscombe Church struck by Lightning. THE tower of the Parish Church of Swanscombe, Kent, was struck by lightning last Thursday afternoon. The lightning conductor failed to act, and the interior woodwork was set on fire. The volunteer fire-brigade was able to save the chancel, but in a little more than an hour the shingled spire on the low squat tower had fallen into the churchyard. The floor of the nave was then covered with smouldering timbers fallen from the roof. Authorities are not agreed as to the precise date of the church. Watling Street runs through the woods near the rectory, and Roman flat tiles are built into the tower, in the courses of squared stones at the corners with some degree of regularity, but scattered sparingly through the flints of which the bulk of this structure is composed. It is said that a church existed here as early as the sixth century, and that the present structure is the only Anglo-Saxon church in Kent. On this point authorities are not quite agreed. The tower is probably Transition-Norman, the basal portion being older than the upper part, in which windows of later date have been inserted. In the lower part, on the south side, is a double-splayed, round-headed window, ascribed to the time of Edward the Confessor. But as the splays are formed with Roman tiles of a similar character to those in the corner courses of the tower, which seems to date from after the Conquest, it is doubtful if this window can justly be claimed as Saxon work. The chief portion of the fabric is Early English, with later insertions. The nave has a clearstory, and north and south aisles, from which it is separated by arches on each side, the pillars resting on circular piers, and having octagonal capitals.

The Damage Done. THE tower has been completely gutted, the two floors having been burnt out, and the peal of six bells, cast in 1749, have either been melted or buried under the mass of fallen timber. The nave is open to the sky and the floor covered with charred beams, seats and books. The chancel and organ are intact; but the fine old Norman font, formed of a block of solid chalk, and ornamented with emblems of the Evangelists had been shattered, probably from the combined effects of fire and water. The carving has been defaced, and this is said to have done by Cromwell's soldiery. The relics of the old faith still remain, and have not suffered from the fire. The uninjured wall of the south aisle shows the stairs that led to the rood-loft; the piscinas stand in the chancel and the aisle chapel, and a small opening—perhaps an aumbry, though locally believed to be a "lepers' window"—blocked up on the outside, remains in the south wall of the chancel. But the oak screen, formed from the ancient rood-loft, has perished: though by no means comparable to the finer work still remaining in Norfolk, it was of considerable merit. The old glass seems to have gone long ago. Only one piece remains—a shield of arms in the south aisles. The church plate and registers, dating from 1559, have been saved, and the latter, though somewhat damaged in the bindings are quite legible. Little damage has been done to the Weldon monuments, the chief of which is the tomb to Sir Ralph Weldon, officer of the household to Elizabeth and James I. It is of the usual Renaissance type, with effigies of the Knight and his Dame on the top, and of their children (three boys and five girls) on the front. The tomb of Sir Erasmus Wilson, at whose cost the nave and aisles were restored some years ago, is untouched. The oldest parts of the church have suffered least. The skeleton of the structure seems as sound as ever; outwardly the tower shows no marks of damage, and the remarkable window, claimed as Saxon, escaped altogether.

HOUSE AT OXFORD: GROUND PLAN. HENRY T. HARE, F.R.I.B.A., ARCHITECT.

MEASURING-UP BUILDINGS.—I.

By ROBERT W. CARDEN, A.R.I.B.A.

A QUERY on this subject recently appeared in the Enquiry column of the BUILDERS' JOURNAL and was briefly answered. It is thought, however, that the following notes enlarging upon the methods employed may be found of assistance to junior members of the architectural profession:—

There are, as "G. A. T. M." pointed out, practically two methods in use—firstly, that of plotting to scale on the spot with or without the dimensions figured on; and, secondly, that of constructing an approximately correct plan and then figuring all sizes upon it. The first method is open to many objections, and is in no way to be recommended, for in order to ensure any degree of accuracy the building to be measured must be plotted to a large scale, say ½in. to 1ft., and this immediately becomes impracticable in buildings of any size larger than the simplest of cottages. Thus in all probability the building would be plotted at most to ¼in. scale, and to this scale it is impossible to measure accurately down to ½in., so that errors are bound to occur. It therefore becomes necessary to figure on every dimension as well as plotting it to scale on the spot, and much valuable time is thus consumed. It is far better to adopt the second method. An approximate plan is easily procured by using square ruled paper, pacing the lengths of the walls and jotting them down roughly to a scale in which each pace is represented by three or four squares. With this as a basis, all that is required can be measured with the tape or rule and set down on the plan.

Before proceeding to discuss the actual methods of entering the measurements on the plan, it will be advisable to mention a few of the stumbling blocks which almost invariably are to be found in surveys of this class. To a beginner it is natural to assume that a square-looking room *is* square, but experience has taught the writer that it is fatal to *assume anything*, and that for every hundred assumptions made ninety-nine are wrong and entail partial or complete remeasurement. No room should be taken as foursquare until the diagonals have proved it to be so. Diagonals should be taken wherever possible, and every main point should be fixed by three dimensions which meet at one point, the first two settling the position of the point and the third proving it to be correct. Place no trust in old plans, which officious caretakers sometimes unearth from the dusty and dirty recesses of the basement, until you have checked every point on the plan by the building itself, and at least certified the accuracy of the leading dimensions. Note also whether alterations have been made since the plan was drawn. Very much will be found to depend upon the object for which the survey is required. If it is a factory to be altered for the purpose of adding new machinery it may probably only be necessary to note the position of the supports which will carry the plant, the position and heights of windows past which the shafting will be carried, and the positions of girders and joists when the belting connects machines on two floors. Again, the survey may be required as a record of buildings to be destroyed. In this case more detail and minuteness must be shown in the plans, for after all the lengths of walls have been settled in gross each room must be taken separately, and every feature recorded with its height, breadth and depth, and in some cases even the mouldings and state of repair.

There is still another class of measuring-up work which must be considered—measuring for dilapidations and repairs. In this case the work is proceeded with much as above stated, but a final survey of every part is necessary in which the condition of every article in the building is examined and all defects noted in a large note-book. Take, for instance, one large bedroom in an ordinary house which has fallen into considerable disrepair through standing empty or other cause. See that the door hangs properly on its hinges and has not dropped; see that the door has both handles in good repair, that the lockspring acts properly, and that the finger-plates are as they should be. See to the panes of glass in the windows and note those which are broken, examine sash-fasteners, lifts and pulls, and test the sashes to see if they are jammed and whether the cords are good. It would take up too much space to enumerate every one of the thousand points to be examined, but enough has been mentioned to show the lines upon which a dilapidation survey should be conducted.

The illustrations accompanying these notes form part of an actual survey of twelve terrace houses in Devonshire built of rubble, and they will show at a glance the absolute necessity of diagonals. Although appearing rectangular, there is scarcely a right angle on the whole of the premises. The rough plan was prepared as already described, but it will be noticed that the angles are sketched as right angles. It should be mentioned that this survey was made in order to form the basis of alterations, and as the windows were not to be interfered with there was no need to measure them in detail. First of all, each main wall was measured for its whole length with the tape, and the dimension entered on the plan a considerable distance from the wall dealt with and extended by means of dimension lines so as to indicate the whole space included in the measurement. When these main sizes were settled, the minor portions were measured with the five-foot rod, each wall being worked round from corner to corner in an unbroken succession, each dimension figured on close against the portion referred to, and each entry made on the plan, so to speak, facing that portion. With the adoption of this system the smaller dimension lines are rendered unnecessary and the plan is kept less "muddled" than is often the case. It should also be noted that the smaller dimensions are recorded at the same time in the margin and totalled up so as to check their agreement with the gross measurement, thus:—

23ft. 2in. = 2·10
1·11
6·9
4·7
·8
6·5
23·2

If this or a similar system be not adopted, it is impossible to ensure accuracy and to be certain that no dimension has been omitted. The position of the octagonal post could have been ascertained merely with ties from any two of the four points, but obviously there would have been no certainty had not the third dimension been taken, which also tallied and checked the accuracy of those previously recorded. These lines are much the same as diagonals. It is usual for surveyors to enter the diagonals across the plan, as being most easily seen, but they complicate the sketch to such an extent that it often becomes impossible for anyone but the surveyor himself to draw out the correct plan. It will be admitted that a system by which *anyone* can with ease interpret another's handiwork is much to be desired. The author is in the habit of lettering all the angles from which ties are required and entering the diagonals in the margin, as may be seen from the illustration. The line A C was produced to B, and the spot marked in chalk on the wall, and this line A C B formed the base-line of the survey. The building not being rectangular, the first point to fix after the base-line was E. A E, C E and B E were then measured, and as the three lines met in

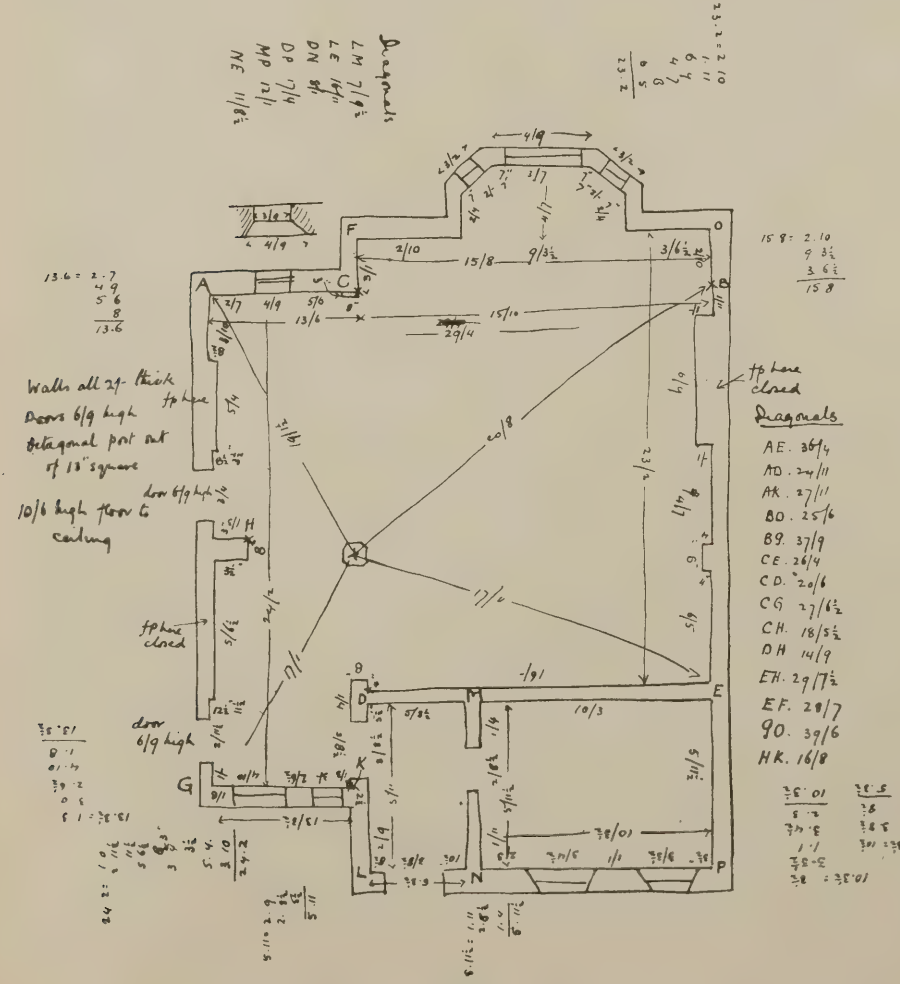


FIG I.—THE ROUGH SKETCH.

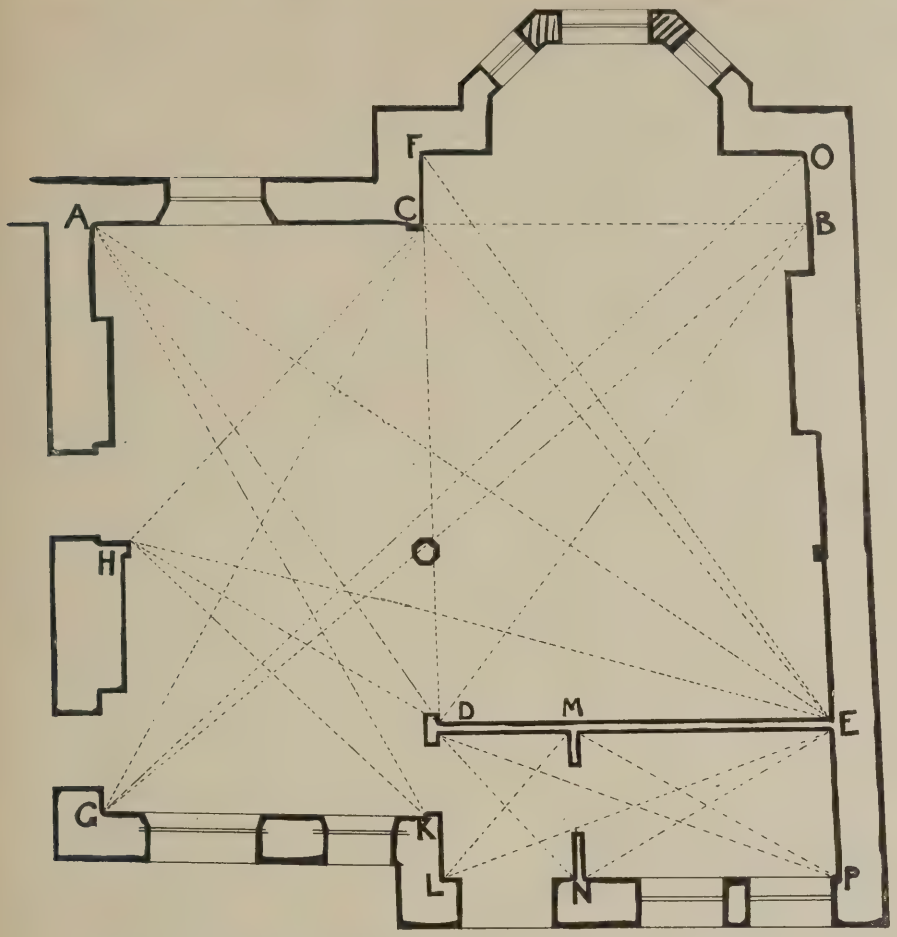

FIG. 2.—THE SAME DRAWN TO SCALE AND SHOWING DIAGONALS.

one point the situation of E was settled beyond question. Similarly BD, CD and AD fixed D, and the same principle disposed of the other points.

To do this class of work rapidly a staff of three will be required, one entering the dimensions on the sketch plan, which, for convenience, is mounted on a small drawing-board, and the other two manipulating the tape and calling out the measurements, which should be repeated aloud by the man with the board to ensure accuracy. Generally, when the greater dimensions have been taken one assistant will be left free, and in the case of dilapidation surveys he can be profitably employed in making the notes as above described for necessary repairs. The other two workers will proceed to take the details with a five-foot rod, and they should be entered on the plan as already described "facing" the corresponding features. It will be noticed that all the dimensions on the plan given are entered as shillings and pence. This is far quicker than employing the more usual dots for feet and inches, and quite as clear, if not clearer. Finally, it must be urged that it is far better to take too many dimensions than too few, that it is unsafe to make assumptions, and that it is essential that every point should be definitely fixed by at least three dimensions concurring at that point. The second illustration shows the same premises correctly drawn to scale, with the diagonals dotted on it. The "right angles" are angles of 87½ and 92½ degrees alternately.

(To be concluded.)

A New Chapel at Llandudno for the Siloh C.M. Church is to be erected from plans by Mr. G. A. Humphreys, architect. Mr. Edward Thomas, Chapel Street, Llandudno, will probably be responsible for a part of the building, while Mr. Luther Roberts will take the main contract.

Correspondence.

The Price of Sheet Lead.

To the Editor of THE BUILDERS' JOURNAL.
LONDON, S.W.

Sir,—On p. xvi of your issue for August 6th the pride of sheet lead is quoted at £13 5s. per ton, *i.e.*, 13s. 3d. per cwt., but on p. 407 of the same issue in the article on "Building Notes and Memoranda" it is priced at £1 6s. per cwt., 6s. of which is the cost of labour. There is thus a discrepancy of 6s. 9d. per cwt. between the two prices for the material which I do not understand how to account for, and should be glad of an explanation.—Yours truly, FRANK J. WALLER.

The prices of building materials given in THE BUILDERS' JOURNAL every week are the current market or wholesale trade prices quoted by the merchants, and are exclusive of carriage, cartage or delivery. These rates therefore represent the wholesale prices paid by the builder to the merchant, without any allowance for carriage, profit, &c. In "Building Notes and Memoranda" the price of 20s. per cwt. (*i.e.*, 26s. less 6s.) represents the builder's selling price of sheet lead delivered where required, and in such quantities as may be required after providing for carriage, cartage or delivery, waste in cutting to size, establishment charges and profit.

T. E. COLEMAN.

Mr. Atwood Slater as a Swimmer.—At Marazion Mr. J. Atwood Slater, the well-known designer, of Bristol, swam completely round St. Michael's Mount, Cornwall; the distance of one mile and a half being accomplished in three-quarters of an hour. Mr. Slater is a Royal Academy exhibitor, and the designer of the subject panels in the reredos of the neighbouring cathedral of Truro.

Law Cases.

Glasgow Buildings Regulation Act: Important Decision.—Mr. R. W. Forsyth, warehouseman, Renfield Street, Glasgow, with the consent of Mr. Stuart Cranston, tea merchant, Buchanan Street, Glasgow, recently presented a petition to the Dean of Guild Court for authority to enlarge his warehouse by carrying out his basement flat to the centre of Renfield Lane. Mr. Forsyth is the proprietor of the property in Renfield Street lying to the south of that lane, and Mr. Cranston of the property lying to the north of the lane. Renfield Lane is a private street, and the boundaries of Mr. Forsyth and Mr. Cranston's properties meet in the centre of the lane. The petitioners in the application to the Court submitted plans showing a retaining wall in the centre of the lane, half on both properties, with a channel on the top to carry the water, gas and other pipes. The petition was opposed by the Master of Works on the grounds which are set forth in the following note by the Lord Dean of Guild (Dr. Gourlay), who finds that the petitioner is entitled to make the alterations and enlargement as proposed, the Master of Works being liable in expenses:—The Master of Works objects to the petitioner putting his property to the proposed use, and maintains that the petitioner is not entitled to carry out his operations without the consent of the Corporation. The only argument in support of this contention was, that section 20 of the Glasgow Buildings Regulations Act, 1900, provides that "the Dean of Guild shall not, without the consent of the Corporation, grant decree for the erection or re-erection of any building upon ground adjoining any street unless on the condition that one-half of the width of such street, measuring such half from the centre of such street towards such ground, shall be cleared of all structures, if any, existing thereon, and shall, subject to the provisions of the Police Acts, be wholly dedicated to the public for street purposes"; that a main street purpose is drainage; that if the petitioners' operations were allowed it would be impossible to carry sewers through Renfield Lane; and that Renfield Lane would no longer, in the words of section 20, be wholly dedicated to the public for street purposes. It is not contended that the property of the ground or of the subsoil has passed to the public, or to the Corporation, or that, to take an illustration, if there were minerals in the ground, the petitioner, even though he might be able to do so without bringing down the surface, could not work his own minerals. If this be so the Dean of Guild is not able to see how the Master of Works can maintain the position he takes up. Streets are no doubt the most convenient places for sewers, but the Dean is not satisfied that dealing with a private street and speaking strictly drainage is a street purpose in a question of dedication to the public. Again, it is to be noticed that the construction of cellars under public streets has been expressly dealt with by section 16 of the Act of 1900. It is said that what is there enacted with reference to public streets is by the terms of section 20 implied as to private streets. The Dean of Guild would be rather disposed to say that as the subsoil of the private street remains the property of the adjacent owner, the provision does not, and was not intended to apply to private streets. The Master of Works stated another objection. By section 65 of the Act of 1900 it is provided *inter alia* "No addition shall, without the consent of the Corporation, be made to any building of the warehouse class. . . . so that the cubical extent of any such building . . . shall exceed 350,000 cub. ft." It is admitted that the petitioner's building is a building of the warehouse class, that the cubical extent of it

as it at present stands is 690,000 cub. ft., and that the operations now proposed would add 6,700 cub. ft. to the building, giving it a total cubical extent of about 696,700 cub. ft. The Master of Works maintained that upon this ground also the petitioner cannot proceed with his proposed operations without first obtaining the consent of the Corporation. The petitioner's answer to this is that as the building already exceeds 350,000 cub. ft. the provision relied on by the Master of Works does not apply; that the fair reading of section 65 is that where a building does not in its existing state exceed 350,000ft. in cubical contents, it cannot be extended so as to exceed that area without the consent of the Corporation; but that the section does not really deal with or regulate buildings which already extend to more than 350,000 cub. ft. The Dean of Guild thinks that the section in question may quite fairly be read as the petitioner contends, and that there is nothing unreasonable in the view that by the section in question Parliament did not deal, and did not intend to deal, with buildings the cubical contents of which already exceed—it maybe largely exceed—350,000ft.

The Dean has accordingly repelled the objections stated by the Master of Works and granted the lining.

A Strike and its Consequences.—The case of *Busfield* v. *T. Taylor & Sons* was heard at Leeds Assizes last Wednesday before Mr. Justice Grantham and a special jury. This was an action to recover damages for alleged false imprisonment. The plaintiff is a joiner and a member of the Joiners' Union, and the defendants are joiners and builders at Bradford and members of the Master Builders' Association. The action, said counsel for the plaintiff, arose out of circumstances connected with a dispute in the joinery trade, at Bradford, which began in June or July, 1901, and resulted in a strike. The plaintiff came over from Birmingham to Bradford, but in consequence of the existing state of things the union did not permit him to work. According to his counsel's statement he took no part in the strike proceedings, and received out-of-work pay. On July 17th, 1901, he went for a bicycle ride with a man named Flatley to a place called Cottingley Bridge, and on their return they saw a crowd of men in Salem Street, in which the defendants' business premises are situated. At this time Mr. T. E. Taylor, a member of the defendants' firm, was, as it was alleged, directing the arrest of a man named Collinson. A policeman who was with Mr. Taylor asked for their names. After this they were taken to the police-station, where their names and addresses were asked for. After a short detention they were allowed to go away without being informed of the nature of the charge against them. At 1 a.m. on July 19th, 1901, the plaintiff was arrested upon a warrant which charged him with intimidating and persistently following certain workmen in the employment of the defendants. Later on the same day he was brought before the stipendiary magistrate to answer the charges, when the hearing of the case was adjourned. Eventually the charge of intimidation was abandoned, and that of persistent following was proceeded with. The proceedings occupied a considerable time. A number of witnesses were called on behalf of the plaintiff to establish an *alibi*, and in the result the charge was dismissed. The plaintiff's case was that the proceedings against him were taken upon the instructions of Mr. Taylor. In the course of his cross-examination in this action the plaintiff admitted that he was free to go where he liked, but he remained at Bradford for a year, receiving 10s. a week. He further stated that he reported himself each morning at the office of the union, but was not aware that in consequence of the strike free labourers were being imported, or that they had been subjected to any molestation. He denied that he had been engaged in picketing. Mr. Taylor, in giving evidence, said that six months before the strike began the master builders proposed to reduce the joiners' wages from 9d. to 8d. per hour. At a conference which was held an offer by the masters to refer the matter to arbitration was declined by the men's representatives. A further offer by the masters to reduce the wages to 8½d. per hour was also declined, and subsequently the union called out their men. As a result of this the Master Builders' Association imported a number of non-union men into Bradford. Trouble followed, owing to picketing, and the police had to be called in. Mr. Taylor spoke of two occasions upon which he saw the plaintiff and Flatley among the crowd who were molesting the free labourers. He informed Mr. Neill, of the firm of Messrs. Neill & Holland, Bradford, solicitors to the Master Builders' Association, of what had taken place, but he never suggested that a warrant should be taken out or a charge preferred against any one. Mr. Neill said that he received no instructions from Mr. Taylor, but acted on behalf of the Masters' Association in the matter. He was himself responsible for a warrant having been issued, and gave as the reason for this course having been adopted that he had found from experience that if summonses were taken out against the men they were usually "transferred" to other districts. Further evidence was given to show that the plaintiff and Flatley were not arrested on July 17th, 1901, but went quite voluntarily, and also to prove that in reality the two men took an active part in interfering with the free labourers. In summing up, the learned Judge said that it was a pity that the difficulties of employers should be increased by the state of things disclosed by this action. His Lordship added, referring to the plaintiff and Flatley, that two good-looking and respectable young men had, no doubt, been living in idleness for a year, taking miserable out-of-work pay rather than do good and useful work for their country; for, after all, they were injuring their country, and especially the district in question, by acting in the way they had done. In reply to a question by his Lordship, the jury intimated that they believed the account which had been given by Mr. Taylor. In the result a verdict and judgment was given for the defendants. Two other actions had been brought against the defendants for false imprisonment by Flatley and another man named Cousen. They were, however, determined by the result of Busfield's action, and accordingly in each of them judgment was given for the defendants.

A Small Cricket Pavilion.—The accommodation for the pavilion illustrated on this page embraces a large room for club meetings and teas, &c., a visitors' dressing-room with wash basin, members' dressing-room with same, kitchen for preparing tea with hatch for serving refreshments, a store for rollers, cutters' nets, &c., separate w.c.'s and urinals for visitors and members. The scorers are placed centrally under a small tower, with bell over it. A clock is provided. There is a varandah with seats on the front, and over the central part is a balcony carried on posts. The staircase to this leads from the large room. The materials are brick plinth, half timber and white plaster with wrought-iron brackets to carry eaves gutter. The roof is covered with hand-made Hartshill tiles. The pavilion, owing to the district being an open one, has been built substantially to withstand the high winds.

Views and Reviews.

Elementary Design.

The admitted aim of this book is to describe the elementary stages of practical designing, with the further object of helping the young craftsman. We hardly see the need of such a book when the same information has been given before in many other similar compilations: and, moreover, this book has the fault common among those of its kind that it lacks system, so that one rambles from subject to subject without any very definite purpose, notwithstanding that the various chapters are supposed to deal with special treatments. There is not much to which exception can be taken, but on the other hand there is not much to praise. The best chapters in the book are the first two and the last, the description of the various materials and tools used and the numerous hints on stencilling, transferring, &c., being very useful to the young student. The book is illustrated by a number of plates, most of which shows groups of forms allied to one another in their general design.

"Decorative Brush-Work and Elementary Design," by Henry Cadness. London: B. T. Batsford, High Holborn. Price 3s. 6d. nett.

A Guide for Sanitary Inspectors.

This is an excellent book for sanitary inspectors. To such officials an exact and discriminating knowledge of the Public Health Act of 1875 and the Amendment Act of 1890 is imperative, but the acquirement of such knowledge is laborious. To render it easier the author has picked out those sections which immediately concern the inspector of nuisances, and has set down in clear language the special points relating to them. This is the value of the book. Legal phraseology, however necessary, is generally involved, and often ambiguous; so that it requires a very careful reading to grasp the exact meaning. The Acts in question do not suffer so much from this as other statutes which might be mentioned; but the following extract shows how very clearly the author explains the various regulations: "Section 13.—This section vests all existing sewers, and those to be constructed in the future, in the local authority of the district in which they now or will exist, and under whose control they are to be. There are three exceptions to this—First, in the case where sewers are or have been constructed by any person or company for the purpose of making a profit for such person or for the shareholders of the company. Second, where sewers are 'made and used for the purpose of draining, preserving or improving land under any local or private Act of Parliament, or for the purpose of irrigating land'; and, third, 'sewers under the authority of any commissioners of sewers appointed by the Crown.'" With the matter so clearly set forth the inspector (and, more especially, the student preparing for examination) has no difficulty in seeing what each section means. In addition, the author supplements his succinct explanations by comment arising out of his own experience. For example, when referring to section 35 of the parent Act, which requires "an ashpit furnished with proper doors and coverings," he observes that this evidently means a brick dust-bin or pit; "but all present-day sanatarians strongly condemn such receptacles for house refuse, for the reason that, being large, they may not be emptied as often as they should be to prevent their becoming a nuisance. . . . . Ashpits should be superseded where possible, and particularly in towns, by galvanized iron dust-bins with tight-fitting lids." Or again, in dealing with section 36, the author observes that it frequently happens—in rural districts more particularly—that one water-closet, earth-closet or privy is used by the occupiers of two or more neighbouring cottages, "and where it appears to be sufficient the local authority need not enforce the provisions of this section by requiring one to be provided for each house." These extracts suffice to show the author's method; and we need say little more. The book itself is very clearly printed in good-sized type with each section boldly lettered, besides which a good index makes reference easy. We should, however, like to point out that the word "by-law" (which is here used scores of times) is spelt without an "e"; for it is derived primarily from the Scandinavian word "by"—a town (in Danish *by-lov*, a municipal law, or *by-lag* in Swedish). We know that the spelling commonly adopted by companies, public authorities and others is "bye-law," but all the best dictionaries show this to be incorrect.

"The Sanitary Inspector's Guide," by Henry Lemmoin-Cannon. London: P. S. King & Son, Orchard House, Westminster. Price 3s. 6d. nett.

The Garden City Scheme.

Mr. Howard's scheme for a garden city combining the advantages of both town and country is pretty well known now by most persons, but very great advances have been made since we first gave notice to it three years ago. The book under review is the second edition of "To-Morrow." It deals fully with the details of the scheme, and to those who have not already read the first edition we can recommend its perusal. There can be no doubt that Mr. Howard is working on the right lines—he sees that it is useless to urge the workers to leave the crowded towns without offering some corresponding advantages. We wish the Garden City Pioneer Co., Ltd., every success in the very laudable effort which it has been formed to promote. As Mr. Howard observes, the subscribers to this preliminary company will run considerable risk; and as the profits, even in the event of the most complete success, will only be nominal, the appeal will be addressed only to those who take an interest in the project as public-spirited citizens.

"Garden Cities of To-Morrow," by Ebenezer Howard, London: Swan Sonnenschein & Co., Ltd., Paternoster Square. Price 1s. nett.

Surveying & Sanitation.

Mr. J. V. M'Auley, of Newbridge, has been appointed by the Meath County Council assistant county surveyor for the Dunshaughlin district, out of thirty-two applicants for the position.

The Commission on Sewage.—The Commissioners appointed in 1898 to enquire and report what methods of treating and disposing of sewage may properly be adopted have issued their second report as a Blue-book [Cd. 1,178]. This contains the following reports, which have been made by the officers appointed by the Commissioners for the purpose of the investigations:—(1) The Oxidation of Sterile Sewage, by Mr. Colin C. Frye. (2) The Manchester Experiments, by Professor Boyce and Dr. G. McGowan. (3) Bacteriological Standards in relation to potable and non-potable streams, by Dr. A. C. Houston. (4) Anthrax in Yeovil Sewage, by Dr. A. C. Houston. (5) The Subcutaneous Injection of Animals, by Dr. A. C. Houston. (6) The Longevity of B. Typhosus in Sewage, by Dr. A. MacConkey. (7) Effect of Filtration in reducing the number of Bacteria in Sewage Effluents, by Professors Boyce and Drs. MacConkey, Grünbaum and Hill. (8) The Pollution of the River Severn in the Shrewsbury District, by Professor Boyce and Drs. MacConkey, Grünbaum and Hill. (9) The Self-purification of the River Severn, by Mr. Colin C. Frye. (10) Some of the chief methods used in the Bacteriological Examination of Sewage and Effluents, by Dr. A. C. Houston.—Since the issue of the interim report Mr. Thomas William Killick and Mr. Charles Philip Cotton found it necessary to resign their seats on the Commission. The report is signed by Lord Iddesleigh (chairman), Lieutenant-Colonel C. Phipps Carey, Sir Michael Foster, Lieutenant-Colonel T. Walter Harding, Professor William Ramsay, Dr. J. B. Russell and Mr. W. H. Power; and by Mr. F. J. Willis as secretary.

Engineering Notes.

Trams at Hove.—The Town Council have decided to run trams on their different routes at an estimated cost of £103,636. The scheme includes taking over the present tramway from Hove to Shoreham, five miles distant.

The New Pyrmont Bridge at Sydney, New South Wales, has been opened, and now tenders have been received for the mammoth bridge which is to cross the harbour and connect Sydney proper with North Sydney. The highest was from Joseph Bentley, of Leeds, for £7,720,478, but the majority of the contractors estimated the cost at between £1,500,000 and £1,850,000. Sir William Arrol & Co., and Head, Wrightson & Co. tendered at £1,710,688. The designs were for a structure 300ft. long without approaches. In addition to the bridges, Mr. O'Sullivan, the New South Wales Minister of Public Works, promises that within two years Sydney shall possess one of the finest railway stations in the world.

A new Fire Ladder.—An exhibition was given last week of the fire ladder which has been produced by Schapler-Fries, a German firm, in the yard of the well-known firm of Messrs. Whitbread, Chiswell Street. The escape is pneumatic, and is capable of being raised to a height of 83ft., more than ample for the tallest buildings in London. It was actuated very simply. The ladder can be taken through the narrow streets, even of the Metropolitan district, without discomfort, and two horses are sufficient for draft purposes. It is possible, with a man stationed at the top of the ladder, to send it to its full height of 83ft. without support, and without his extending a hand to assist. The ladder closed to its normal dimensions as easily as a telescope.

New Companies.

D. Jacobs & Sons, Ltd.

Registered to acquire the business carried on at Hackney Road, London, as D. Jacobs & Sons, and to carry on the business of timber merchants, furniture dealers, upholsterers, engineers, decorators, builders' merchants, &c. Capital £3,000 in £1 shares.

Bell & Burnie, Ltd.

Registered to acquire the business of joiners, builders, engineers, contractors, &c., carried on at Bootle, Lancashire, as Bell & Burnie, and to carry on the business of joiners, builders, engineers, contractors, ship fitters, furnishers and repairers, refrigerator builders, dealers in charcoal, silicate cotton, hair, felt, and insulating materials, contractors for insulation work, timber merchants, sawmill proprietors, builders' merchants, land and property owners, &c. Capital £10,000 in £1 shares. The first directors are John Bell and Joseph Burnie.

Ilford Manor Estates, Ltd.

Registered to acquire, by purchase or otherwise, any real or personal property, estates, lands, &c., and to develop the same as builders and contractors, brick, tile and terra-cotta goods manufacturers, builders' materials merchants, &c. Capital £1,000 in £1 shares.

Middlesex Dwellings, Ltd.

An Architectural Causerie.

Balmoral Castle. The late Queen Victoria had no liking for changes in her latter days, and thus it happened that no alterations were made to Balmoral Castle; she, however, left an instruction that if it was thought necessary after her death to make any alterations these should only be done by a Scottish architect. His Majesty the King has had many changes made at Windsor Castle and Buckingham Palace and Balmoral has now been similarly overhauled. During the residence of the Court there last autumn, Dr. Rowand Anderson, the well-known Scottish architect, was sent for, and at his suggestion many improvements have been carried out so as to render the internal arrangements of the Castle more suited to present requirements. These alterations have been in progress for the last six months, and are now practically completed. Among other things a new heating system has been introduced and improvements made in the servants' accommodation, besides which the cleaners and the upholsterers have been very busy preparing the place for the King's visit.

Exterior Gilding. When the great Palace of Westminster was completed and Parliament was "at last lodged as Parliament should be," the average Englishman, compelled to admire a structure which in spite of some faults is beautiful, yet strongly inclined to exercise his national privilege of grumbling, was often heard to say that it was "gilt gingerbread." There is a considerable amount of gold about the building: it catches the light above the Victoria Tower; it glitters over the great clock; it sparkles upon vanes and railings; its presence seems to give a certain brilliancy even on the darkest days. In our time it is no longer objected to; the building is not criticised by the public, for it has grown familiar and the gold is accepted, with the shields and lions, the Tudor roses and the portcullises of Westminster, which adorn it from end to end. The cross of St. Paul's Cathedral again gives us a point of light above the lantern, the Golden Gallery being immediately beneath it. But gold is practically absent from the greater part of London as a decorative detail in architecture—for the mere gilt-letter mania of the last few years is in no sense architectural. Abroad, gold is much affected—for external decoration. Paris uses it nobly: Mansard's fine dome of the Invalides was not spoilt by the golden "trophies" placed on it by Napoleon; it is freely used to enrich gates and grilles, and gives an air of splendour to the new Alexander Bridge, whose four "pylons" are crowned with statuary groups of gilded bronze. In Brussels the famous Grande Place, picturesque and historic, is surrounded by the old halls of the companies whose mullions are heavily gilded. In Munich may be seen "Old German" fronts whose walls are almost covered with processions of knights and ladies, burghers and men-at-arms, painted in colours on a flat gold ground; above rise high-pitched roofs of a deep chocolate or reddish-brown. Can gold be utilised for decorative systems in the rebuilding of London? The first thing to be said in answer is that the association of this particular metal with the idea of wealth is so deeply rooted in the human mind that not many people can bring themselves to pass judgment fairly upon it *as a colour*. The long period, too, in which colour was practically allowed to die out in architecture was unfavourable to its employment, but it was much esteemed for internal decoration in England during the Tudor and Elizabethan periods; it was never disdained for a vane, and showed brightly here and there in armorial details of ornamental iron gates. A certain air of splendour is appropriate to a capital city; and the use of gold, if duly restrained, treated as a colour in conjunction with other colours, especially in combination with stone or marble, is one way of obtaining it.

A Work of Art. A paragraph recently appeared in the "Western Daily Mercury" which shows our contemporary's artistic ability. It appears from this that the new style for which we have been waiting so long has arrived. This is the substance of the paragraph: "At the time of the British occupation, Khartoum being in ruins, the Government offices were established at Omdurman, but they are gradually being removed to the new city as the permanent buildings are erected. Omdurman, with its mud hovels, covers a large area, but much is ruinous. The place when taken was indescribably filthy; it is now intersected by wide roads and is under police supervision. The first sight of Khartoum from the river comes as a charming surprise after the long journey through a thousand miles of barrenness, for it is embosomed in trees. The palace, a massive building, is a finished structure of great durability and elegance, and gives the impression that its builders have come to stay. No professional architect was employed—it is, in fact, a new style, an invention of the Royal Engineers. These ingenious officers were quartered here, and got the job to do as part of their duty, and did their best. The result is charming and original. But engineers have to be ubiquitous, like their motto, and those who commenced were not allowed to finish the building. The lower storeys are the design of one engineer, the upper of another, and yet the whole is congruous."

COLONNADE, AMALIENBORG PALACE, COPENHAGEN.

St. Mark's Campanile. The decision of the Royal Academy to open a public subscription for contributions towards the fund for rebuilding St. Mark's Campanile at Venice is a new departure, and the spirit in which the offer is made is to be commended, but the argument for the rebuilding is not convincing. If all the artists in Christendom had painted pictures of Venice, that would be no reason why the Campanile should be rebuilt in its old ill-proportioned form. Why should it be a lifeless reproduction, and not a product of its own time in its design?

OLD STREET AND CANAL, COPENHAGEN: THORWALDSEN'S MUSEUM TO THE RIGHT.

COPENHAGEN AND ITS SURROUNDINGS.

By G. R. BRYCE.

LIKE many other Continental towns, the Danish capital has much to attract and interest the architect. Its quaint streets and unique buildings, its museums and art galleries, not to mention the historical traditions which belong to it, make Copenhagen a suitable happy hunting-ground for the student who combines recreation with the pursuit of his profession. Copenhagen is one of those cities in which present-day advance is united with old-fashioned quaintness. Passing from the large central square called Kongens Nytorv by a narrow winding street composed of shops replete with the latest novelties, one emerges upon an old market-place and finds peasant women in quaint Dutch costume sitting by their fruit or vegetable stands. Within a stone's throw of the tall old whitewashed houses fronting the sleepy canals electric cars dart through the quarter of up-to-date hotels and railway stations. Large ocean steamers are berthed close to old-fashioned wooden vessels and make a strong contrast.

Approaching the city from the Sound, the flatness of the country enables one to descry the gilded domes and slender spires long before entering the harbour. When at length the steamer reaches her berth in the middle of the town, the surroundings are strikingly picturesque. The Exchange, with its row of gables and fantastic spire, is before us—in front passing one of the canals which intersect the city. In the background may be seen the imposing ruins of Christiansborg Palace, as well as some of the old whitewashed houses with their casement windows and tiled roofs. The old boats and barges which lie along the sides of the canal make a curious but pleasing foreground, and their quaint appearance harmonizes well with the age and dignity of the surrounding buildings.

Copenhagen is said to have been founded by Bishop Absalon towards the close of the twelfth century, its early name being "Havn" (harbour) or "Köpmannahavn." The present Danish spelling is Kjøbenhavn, meaning literally "merchants' harbour."

The Exchange (Børsen) is perhaps the most striking building of the city. As will be seen from the accompanying illustration, it faces a canal on one side; on the other is a boulevard, so that the whole building can be viewed only from the four corners—never in direct "elevation." At the intersection of the centre gables and the main ridge rises an octagonal lantern, which is surmounted by a curious spire formed of dragons' tails, twisting to a point 165ft. from the ground. The building dates from about 1620, and is an example of the encouragement the architecture of Denmark received from King Christian IV.

The sculptor Bertel Thorwaldsen is perhaps most popularly known by his famous carving in the rock at Lucerne, but his statues of Christ and the twelve Apostles must be scarcely less renowned. These masterpieces were made for and and are preserved in the Frue Kirke in Copenhagen—externally a severely plain building, giving but scant indication of treasures within. Entrance is by a Greek Doric portico with six columns, in the pediment of which is a group representing John the Baptist preaching in the wilderness. The opposite end of the church finishes with a semicircular apse in which the statue of Christ is placed immediately behind the altar. The interior of the church resembles a basilica, the broad pillars of the nave being connected by arches above which a range of Doric columns supports the semicircular vault. The figures of the Apostles are placed on both sides of the nave, one in front of each pillar, the church being lighted from the roof. Each of the statues is a marvellous piece of work, depicting by look and attitude the character of the man it represents. The bending head and stretched-out arms of the Saviour give an air of compassion and tenderness surely indicative of a great masterpiece. Besides these statues, there is a beautiful figure of a kneeling angel supporting a large shell to contain the baptismal water. These statues, although not entirely the handiwork of Thorwaldsen himself, were executed principally by him.

Thorwaldsen spent most of his life in Rome, but in 1838, six years before his death, he returned and settled in his native city. It had been suggested to him that he should bequeath to the city the almost complete collection of his works which he possessed, consisting of plaster models, partly finished works and marble replicas. He eagerly took up the idea, and a sum was gathered to erect a building to house the collection. But as money was not at that time very plentiful in Denmark, the promoters of the scheme were at a loss how to spend to best advantage the comparatively small amount at their disposal. King Frederick VI. offered an old stable near the castle, and it was this unlikely building the architect Bindesbøll converted into what is both museum and mausoleum—the body of the great sculptor being interred, by his own wish, amidst his works. The museum is ranged round an open rectangular court which contains Thorwaldsen's grave in the centre. Most of the rooms are small, and open into one another—an arrangement suggested by Thorwaldsen himself, as he wished the visitor to concentrate his attention on only a few works at one time. Each room contains one statue, two busts and two or three bas-reliefs on the walls. Altogether there are eighty statues, 130 busts, 240 reliefs and three large friezes, besides a great many models and sketches; 124 of the works are

in marble. On the outside of the museum is a representation by means of different coloured cements of Thorwaldsen landing in Copenhagen in 1838. On one wall he is shown arriving amid great rejoicing, and on another his sculptures are being conveyed from the vessel to the museum.

The Glyptothek is also well worth visiting. This collection was begun many years ago by Mr. Carl Jacobsen, a well-known brewer and enthusiastic art patron, when he brought together a few figures for a winter garden. After some years the collection had attained considerable dimensions, and in 1888 Mr. Jacobsen decided to present it to the nation. The exhibits are principally Danish and French works, a number of the former being by Bissen and Jerichau, pupils of Thorwaldsen. There is a remarkable statue of "Princess Alexandra" by Chapu in the Glyptothek. It portrays the Queen in her younger days, the grace and dignity of the seated figure making it striking and lifelike. The companion statue of "Princess Dagmar" by Gauthurin is not quite so fascinating—perhaps because the subject is less familiar.

Close to the Glyptothek are two magnificent parks—the Fredericksberg Gardens and Søndermarken, separated only by the public road. They cover about 90 acres each. It was at Fredericksberg Castle that Queen Caroline Mathilde, consort of King Christian VII. and sister of George III. of Great Britain, lived when she came to Denmark. When the English bombarded Copenhagen, in 1807, General Ludlow made this castle his headquarters. The fine avenues of trees surrounding the castle are a favourite resort of the city toilers, as well as the less cultivated Søndermarken, which is more of a wood than a cultivated park.

Numbers of electric and horse tramcars ply frequently between the city and suburbs, and boarding one of these at the Fredericksberg gates one is soon conveyed back again to the Raadhusplads. The very large Raadhus (town house) has only lately been completed. Hr Martin Nyrop has designed an original and imposing building, and viewing it from different quarters there are many and varied groupings to please the eye. The tower is 330ft. high. Over the principal entrance is a statue of the founder of the city.

Another modern building of interest is the English church of St. Alban, designed by the late Sir Arthur Blomfield in 1887. It is prettily situated among trees near the old moat and ramparts of the "Kastel."

One of the illustrations shows the Amalienborg Palace. In the centre of the square may be seen an equestrian statue of King Frederik V. by the French sculptor Sally. The design shown in the photograph is repeated on the other sides of the square, so that there are four identical elevations. Originally the residences of four noblemen, this has been the king's town palace since Christiansborg was demolished by fire in 1884. This is the aristocratic part of the city, many of the nobility having houses in it.

The Round Tower, which adjoins Trinity Church, is remarkable in having a spiral passage by which to reach the top. Tradition asserts that Peter the Great traversed it on horseback—a feat not difficult of accomplishment, as the passage is broad and lofty and the gradient an easy one. The view from the top is extensive, and, besides picking out the different features of the city, one may enjoy the panoramas of the surrounding country on one hand and the different islands and narrow coast-line of Sweden on the other.

The situation and surroundings of the Palace of Fredericksborg enhance its beauty, rising as it does from a lake on three small islets, against the grand background of a forest. It was here Christian IV. was born, on April 12th, 1577. Although the original Fredericksborg was a handsome and fairly commodious dwelling in Renaissance style, the young king soon decided to build a large new palace there. On January 15th, 1602, he made an agreement with a contractor, Friborg by name, to pull down the old, and on May 2nd to build the main buildings of the new castle, according to a model supplied by the king, the price agreed upon being the apparently modest sum of 15,000 rigsdaler (nine rigsdaler equal to £1). No doubt, however, the "extras" became rather a serious matter. The three wings of the new palace were brought under roof during the years 1606-8, but the king went on adding auxiliary buildings and embellishments as late as the year 1621.

The palace consists of three large four-storeyed blocks, the central being called the King's, and the two wings the Church wing and the Princess wing, respectively to the spectator's left and right. The King's, or central block, is about 220ft. long, the side wings each 190ft. On the fourth side of the courtyard is a long low building or gallery, with an elaborate gateway and various embellishments; some of the sculptures, however, have vanished. The castle on all four sides rises perpendicularly from the lake. The Church wing has a magnificent bell tower, about 300ft. to the top of the spire. From the inner courtyard a bridge leads over the moat to the outer, flanked by two long, somewhat plain, buildings. Opposite is a square, very massive and very handsome, gate or prison tower, which was finished in the year 1621.

When finished, the exterior of the castle was still more gorgeous than it is at the present day, the window-frames and many of the sandstone ornaments being gilded; and there were gilt statues in the arches of the gallery that faces the outer courtyard. The interior was still more elaborate, and some of the apartments were almost unique in their splendour. Foremost among them was the large dancing hall, or, as it was afterwards called, the Knights' Hall; its dimensions are very considerable: length about 170ft., breadth about 70ft., and height

AMALIENBORG PALACE COPENHAGEN.

about 23ft. It was extravagantly carved and decorated, twenty-six sculptors working for seven years at the ceiling alone.

Beneath the Knights' Hall is the church. Two rows of brightly polished pillars divide it into a nave and aisles, a balcony being formed over the latter. The ribs of the arches are gilt, and the altar, the pulpit and the font are all profusely decorated with cast and chased silver figures and adornments, much of them the work of Jacob Mores of Hamburg, and his son. At the end opposite the altar is the organ, and behind this the King's Sanctuary, a most beautiful room.

A fine room on the ground floor is the Rose or the Knights' Room (see centre plate); its arched roof rests on polished marble pillars, and the upper portion of the walls is decorated with fighting stags in stucco, the antlers, however, being real.

A devastating fire destroyed the castle on December 17th, 1859. The beautiful church, fortunately, escaped almost unscathed, as did some of the rooms on the ground floor, part of the marble gallery, the bridge and terrace, besides the buildings outside the inner courtyard. The walls, however, were sound; and as many costly ornaments and other articles were saved, it was decided to rebuild the castle in the original style, the King very handsomely heading a national subscription started to raise the necessary funds. Like a veritable phœnix, Fredericksborg rose again from its ashes. It never again, however, became a royal residence, but is now a richly-endowed National Museum.

(To be concluded.)

CONWAY SUSPENSION BRIDGE.

MR. JOHN J. WEBSTER, of Westminster, the engineer called in to advise the Town Council of Conway as to the present condition of the Suspension Bridge, and whose report was regarded as so alarming that a watchman was stationed on the structure to prevent coaches or other heavy vehicles crossing at more than one at a time, recently sent in a supplemental report recommending that the following alterations be made :—

The chain links, not being strong enough, should be supplemented by either another set of links or by steel cables; and, as economy of construction is an important consideration, it is recommended that steel cables be adopted, being less than one-half the cost of the links. It would require two cables about 4in. diameter, which could be fixed above and close to the present top links.

The present parapet lattice work, which is very fragile and corroded in places, to be removed and replaced with stiffening girders of a more substantial nature. These girders would reduce the vibration considerably and so increase the life of the bridge.

All the suspension rods and connections to be renewed with others of stronger construction, and other minor repairs; the whole estimated to cost £4,750. Mr. Webster continues: —"It was suggested that, as the roadway was so narrow and dangerous to foot passengers, a footway might be placed outside the present bridge. This can be done by means of cantilevers attached to the proposed new stiffening girders, which would carry the footway outside the bridge on the Deganwy side. The footway would then pass round the towers on to the existing approaches. This would involve the removal of the present castellated stone parapet round the tower, but I do not think that this would mar the general appearance of the bridge. I estimate the cost of the footpath over the bridge and approaches, 5ft. clear width and parapet railing 4ft. high, including the extra cost of the cable to carry the additional load, to be £1,750."

LOUISIANA EXHIBITION.

THE Foreign Office has recently signified the acceptance by the Government of the invitation of the Government of the United States to take part in the Universal Exposition to be held in St. Louis, 1904. The exhibits to be made by the Government, in its official capacity, will be limited to education and the fine arts. The former will be entrusted to the Education Department, one of whose representatives, Michael E. Sadler, M.A., Director of Special Enquiries, has recently been in America as a delegate to the National Educational Association, which has just held its annual meeting in the city of Minneapolis.

The organisation of the fine art exhibit will be made under the general advice and control of a committee of the Royal Academy, Sir Edward Poynter, the President, having already taken steps in this direction. The general feeling is that the exhibit will include a wide range not only of the fine but also of the applied arts, the authorities of the Exposition having paid much attention to this enlargement of its scope and purpose.

Later, facilities will be provided for exhibitors in every line of industrial activity—agriculture, manufactures, mining and fisheries. The details of these have not yet been arranged, nor have any announcements been made thus far by the Foreign Office, under whose auspices the invitation has been formally accepted and the initial arrangements perfected, as to the funds to be devoted to the carrying out of the undertaking.

France has made a grant of 600,000 frs. (£24,000) for preliminary organisation and the expenses of a commission which has already visited St. Louis. It is announced that a special building (the site for which has already been selected) will be erected upon the Exposition grounds, the Petit Trianon having been chosen for reproduction. Largely increased grants will be made later, so that the participation of the French Government and people is likely to be a conspicuous feature. The space already bespoken is 40,000 sq. metres for exhibits and 5,000 sq. metres for a pavilion.

Japan has appointed a Royal Commission, and has set aside the sum of 2,500,000 yen (£250,000) for the erection of a building and for making an exhibit which shall be complete throughout the whole line of its industries, devoting special attention, however, to artistic products. This commission will be composed of some of its leading statesmen, and perhaps headed by the Emperor or some member of his family. Canada has made a preliminary grant of 125,000 dols. (£25,000), has selected the site for its building, and will make very elaborate exhibits in agriculture and forestry, as well as in its manufactures, railways and mining, besides devoting special attention to its fisheries. Italy will give its official attention to a show of fine and applied arts, including glass and mosaics, which promises, if the plans are carried out, to be more complete than any it has made in any previous exhibition. Mexico and several of the republics and countries of South America, which last year displayed fine exhibits at the Pan-American Exposition at Buffalo, have already accepted the invitation, and will make a strong show of the products peculiar to their soil and climate. In addition to the formal acceptances, the Emperor of China has sent a commission to St. Louis, apparently for the purpose of concluding upon the most direct form in which the Empire may undertake a display. The German Emperor has been consulted in regard to the Universal Exposition, and it is apparent that the desire is that the nation shall be fully represented, both in regard to trade and education, and also in the fine and applied arts section. Further, among the older but now progressive nations, Korea has notified its intention to be represented officially. The Imperial Government at Constantinople has decided to participate and to send a commission to the Exposition, and is encouraging the merchants and manufacturers to become exhibitors. And a movement in Russia is in progress to attain the same ends. To add to the before-mentioned, several other countries of Europe and Asia have signified their intention to be represented with commissions or with official exhibits of some kind. In fact, the probability is that before the end of 1902, while still about a year and a quarter of time will remain for perfecting arrangements, practically every important country in the world will have accepted the invitation to take part.

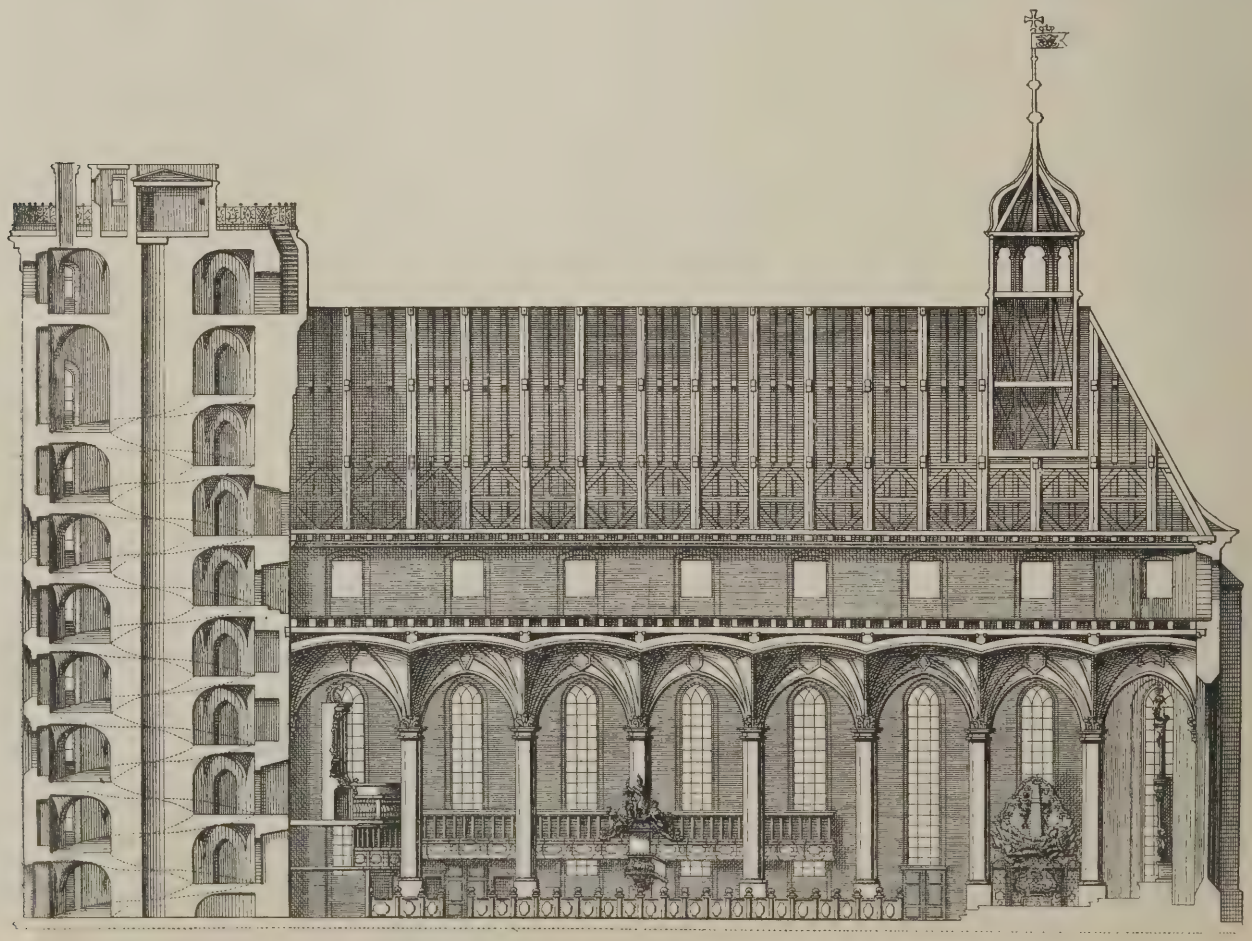
It will be remembered that the Exposition was originally planned to open on May 1st, 1903. The management insisted upon their readiness to go on and complete their work within the period originarly fixed, but it was universally represented to them by foreign countries, by a good many of the individual States in America, and by some of the most important exhibitors that a year's grace would be most welcome. Accordingly, Congress passed a law authorising the postponement. That body had appropriated about 5,500,000 dols. of which 5,000,000 dols. was its contribution of one-third to the capital stock of the Exposition, like amounts being contributed by the city of St. Louis and by a private company. The last Congress, in taking official action, has increased the total contributions of the Government, until they now amount to 6,308,000 dols., a sum wholly unprecedented in the history of international exhibitions. A considerable proportion of the increased sums will be devoted to special exhibits, fisheries being one of the most prominent items. Further, besides the official grant from Washington, the majority of the States in the Union have officially voted a substantial sum for individual buildings in which to present their own peculiar products or to illustrate their history.

But it is not Congress alone that has contributed to this enlargement of plan. The management, finding that this extension of time has been unexpectly granted, have enlarged their scope and plan. This does not so much apply to the mere size or quantity of exhibits, but it has permitted them to give an attention to quality which might have been impossible in the shorter time. Among other things, they have increased the ground space to be used. Originally, this was about 1,000 acres. It has now been so enlarged that it will reach from 1,200 to 1,400 acres. This will include a large tract of land owned by Washington University of St. Louis, upon which a number of new and permanent buildings have already been erected. Substantial progress has been shown in the making of lakes, and several of the more important bufldings of the 200 acres of floor-space to be covered by the Exposition are already far advanced in construction. Of the additions, 75 acres have been set aside for an international military camp and parade ground; 130 acres for the 30-acre Agricultural Palace and live stock exhibits, important features in the Exposition to which it may be anticipated all the world will contribute; indeed, the ground for service is about twice as extensive as that used at the Chicago Exhibition.

The plans are in such a forward state of preparation as to justify the confident expectation that St. Louis will present the one example of an exhibition really ready on the day of opening. The postponement has also promoted the enlargement of the local transportation facilities. The London offices of the Universal Exposition, St. Louis, are at Sanctuary House, Tothill Street, Westminster, London, S.W.

THE ROYAL EXCHANGE, COPENHAGEN.

A NEW LUNATIC ASYLUM.



AT Talgarth an asylum is being jointly erected by the Brecon and Radnor counties. The buildings cover nearly seven acres of ground. The contract, amounting to about £120,000, was entrusted to Mr. Watkin Williams, of Pontypridd. After a little surveying the contractor fortunately found a bed of stone for the buildings at a distance of about half a mile, and this has now been quarried on two sides, the stones being conveyed to the site from one of them over an incline made on the edge of a deep dingle. Clay, too, was found near the site, and all the bricks used, numbering about three millions, have been made on the spot. There are six blocks of buildings for the patients, those for males and females respectively being on each side of the administrative section. Two of them are for epileptics, two for recent and acute patients, and two infirmaries, one being a replica of the other. In the entrance block are a suite of rooms for the medical superintendent, clerks, and committee-rooms and reception-rooms for visitors, and rooms for male attendants on one side and for females on the other. There are four "padded" rooms in the buildings, the sides and floor being made of thick, pliable rubber, every possible regard being paid in their construction to ensure safety and comfort to the unfortunate patients who may be confined in them. Each room has a window, and in the inner door, which has a spring lock, is a small piece of glass which gives a full view of the interior from the outside. In the administrative block is a spacious, lofty dining and recreation hall, with a stage at one end and dressing-rooms adjoining. The roof is arched, the ribs being supported by pilasters. It provides ample accommodation for five hundred persons to dine together, is centrally situated, access from all parts being obtained by means of corridors which run round the whole of the building, one of them being about 500ft. long adjoining. On the opposite side of this corridor are the dispensing-rooms. In the same block is a huge store-room, with cellar beneath, and a laundry fitted with modern appliances. There are also a workshop block and an engine-house. There are two floors throughout, both being similar, and the whole of the corridors, granolithic stairs, and ceilings on the first floor are fireproof. The woodwork is clean varnished pitch-pine, and the wood floors are pitch-pine, cleaned for wax-polishing. The lavatories and bathroom are dadoed with white-glazed bricks.

The exterior work is native stone walling, Grinshill stone dressings, and the inside of the walls is lined with bricks. Accommodation is provided for 350 patients, but provision has been made for extensions. In the administrative part, however, accommodation has been provided to meet the wants of 500 patients. Opposite the main entrance is a spacious church, built on Gothic lines, and to the right is the mortuary and a detached isolation hospital for both sexes. In the immediate vicinity will be a sewage farm. A reservoir has been constructed on rising ground above the asylum. It is covered with a roofing of corrugated iron, and has a storage capacity of 144,000 gals. The reservoir has a depth of 7ft., and the filter beds are enclosed by a high wall. A big tank has been sunk into the ground to store the rainwater for laundry purposes, and it is conveyed from the roofs of the various blocks by means of pipes. The lighting of the premises has been so arranged that the medical officer can switch off the light in one room after he had passed through and turn it on in the next at the same time.

The architects are Messrs. Giles, Gough & Trollope, Craven Street, London, who designed the Parc Gwyllt, Bridgend, and several other asylums. The superintending clerk of the works is Mr. W. T. Creedy, who has been appointed by the architects to superintend the erection of the workhouse and infirmary being built at Hammersmith at a cost of £200,000.

THE PUBLIC HEALTH CONGRESS.

THE Annual Congress of the Royal Institute of Public Health was opened at Exeter last Thursday, the Earl of Iddesleigh, the president, in the chair. In the course of his address the president referred to the Royal Commission on Sewage Disposal, of which he is chairman, and said that the second report of the Commission just issued contained reports of high value. He paid a tribute of sincere respect to the two great communities of Manchester and Leeds. The amount of public spirit that both of them had shown in endeavouring to solve the difficulties attendant upon any satisfactory system of sewage disposal was beyond all praise. He regretted that he could not give some idea of the probable date at which the Commission would issue its final report and recommendations. They would soon, he hoped, be able to publish the results of a prolonged investigation into the treatment of sewage on land; and their experts were now making elaborate parallel examinations of some of the processes of filtration by artificial means. But he feared that they would ultimately be obliged to bring their proceedings to an arbitrary close; for, however much they could learn, he was quite certain they could never come to a point at which they could say there was nothing more to be learned. The subject was inexhaustible. Another subject of great importance was that of the use and abuse of our water supplies. If he were an absolute Emperor he should appoint a department of the Government to deal solely with water administration. He should expect that depart-

SECTION OF ROUND TOWER AND TRINITY CHURCH, COPENHAGEN.

THE ROYAL SHOOTING BOX ("EREMITAGEN"), COPENHAGEN.

ment to prove beneficial to the community by the wise exercise of its discretionary powers and to a greater degree by reason of the knowledge which it would slowly accumulate and place at the disposal of the country. One simply could not exaggerate the vital consequences of exact knowledge concerning water supplies, either in respect of health or wealth. Without exact knowledge the people were in perpetual danger of recklessness on the one side and of fads on the other.

Mr. Mawbey's Address.

Mr. E. G. Mawbey, of Leicester, in the course of his presidential address in the section devoted to engineering and architecture, enforced the importance of pure air and water, a dry and clean sub-soil, the diminution of noise from traffic in our streets, exercise and personal cleanliness, with healthy and cheerful homes and surroundings, and plenty of honest and well-directed work. In order to obtain pure air there should be adequate public and private scavenging and cremation of refuse, efficient ventilation, wide thoroughfares, and ample intercepting streets, proper construction, cleansing, and ventilation of sewers and drains, and other sanitary arrangements; open spaces in centres of population, ample air spaces in dwellings and around our factories and workshops, to ensure light and air; the prevention and abatement of smoke, due restrictions upon noxious trades, electrification of our poisonous underground railways, the drainage and prevention of the pollution of subsoils and the diminution of malarial and other troubles by the reclamation of swamps; improved drainage and carrying out of floods prevention schemes. The legislation for the last-named, he urged, was far from what it should be in the way of providing facilities for small local authorities to rid the districts and inhabited areas from disastrous floods. Supplies of pure water were to be ensured by the satisfactory disposal and efficient purification of the sewage of every town, village, and habitation, the prevention of fouling of rivers, watercourses, and springs; and by the compulsory provision of a practically pure public water-supply, not only to our large towns, but also throughout all rural districts where large populations were now depending for their supply upon shallow and frequently highly-polluted wells in close proximity to the dwellings. There was great need for a movement, in conjunction with the Local Government Board, for the better control and utilisation of our catchment and drainage areas, so as to facilitate and even enforce the joint schemes by groups of municipalities and local authorities for the supply of wholesome water within the various watersheds of the country. In order to encourage exercise and personal cleanliness, ample provision of recreation grounds, gymnasia, baths and open-air bathing stations, &c., was indispensable in all thickly-populated districts. It was notable that the architects of the present day were making an earnest study of hygiene. The duties of sanitary and building inspectors were of vital importance, not only in discovering insanitary conditions and defects in construction, but in dealing with the neglect, misuse and mismanagement of even the best sanitary works which could be provided. There was, perhaps, no more difficult problem to be solved than the successful purification of sewage, and certainly nothing had given so much hope of a satisfactory solution of the difficulty as the recent experiments which had been conducted on bacteriological lines.

Sanitation in Rural Districts.

The proceedings were continued on Friday, Sir C. Cameron, of Dublin, presiding. Captain G. Phillips, of Frimley, Surrey, read a paper on the necessity for teaching the principles of public health in rural districts, in which he strongly advocated the appointment of sanitary inspectors by the Local Government Board of a higher order than the local inspectors, who should make thorough inspections of all the sanitary appliances in every cottage throughout the rural districts. They should also teach the people practical sanitation, pointing out the existing defects, and encouraging the people to correct all injurious and insanitary habits. Mr. Tolson (Exeter) advocated the creation of a ministry of public health and the appointment of independent sanitary officers over large areas. They could not expect too much of a medical officer of health who had a large district and £40 a year. Professor Smith said one was ashamed of the condition of things in the villages. The generality of farms were anything but what could be desired. He moved that the council of the institute be requested to consider what steps should be taken to urge the Government to improve the sanitary condition of rural districts.—The President (Sir C. Cameron) said there was some excuse for the idea that sanitary work was not so necessary in rural districts as in towns, seeing that the death-rate was 15 per 1,000 against 20 per 1,000 in towns. But the urban districts were menaced by the condition of things in rural districts through the food supplies, especially milk and butter. Therefore the towns were as much interested as the villages in the sanitary state of rural districts.

Several papers were read on the question of "Hygiene in Public Schools," and a resolution was passed expressing the opinion that great benefit would result from the teaching of the rudimentary facts of hygiene in elementary schools.

In the section for engineering and architecture Mr. T. Cain (City Engineer of Worcester) contributed a paper on typhoid fever in relation to water supply. It had been said, he remarked, that the typhoid case rate of any town was a fair index of the hygienic quality of its water supply. Whether that statement expressed a general truth was one of the most serious questions that could engage the consideration of those authorities who were charged with the health of the public. If the answer proved to be in the affirmative, there could rest upon the water authorities of those towns which suffered from a high typhoid case rate the responsibility of effecting such changes in the source of the water supply, or in the treatment of it before distribution, as would prevent it from being any longer a vehicle of disease germs to the consumer. His experience and investigations convinced him that the proposition expressed a general truth. He was conscious of the responsibility he incurred in attributing almost universally to

THE ROUND TOWER, COPENHAGEN.

the water supplies the typhoid incidence, not of this country, but of any others. But in a matter of such serious import as the public health he had felt bound to give expression to his convictions, hoping that others might pursue the investigation further, and believing that in the end only good could result.

Mr. Frank Lesie Watson, civil engineer, read a paper on "Recent Practice in Refuse Disposal and Utilisation Plant," in the course of which he said that the most important and successful electric lighting and destructor plant hitherto erected was that of the Fulham Corporation.

Views and Reviews.

American Surveying.

The appearance of a new and comprehensive work upon land surveying is a matter of considerable importance, and especially is this the case with the book now under review. Mr. Nugent, as an American himself and Associate Professor of Engineering in an American University, has produced a volume which illustrates the principles of surveying as seen from the American point of view with remarkable clearness, and its interest to an English reader lies largely in the divergencies from English practice which are in consequence unconsciously brought into prominence. In America the surveyor has to deal with large tracts of open country, practically unexplored, and consequently comparatively inaccurate surveys plotted to a small scale will serve his purpose, speed and approximate correctness being the main requirements. Thus the theodolite, which is the principal English instrument, and without which work of great precision can scarcely be accomplished, is rarely used, being replaced by the compass for all ordinary work, where the risk of accidental attraction of the needles is not great. To an English surveyor who has learnt to consider accuracy as the most important of all desiderata, this appears to be radically wrong, and the impression is not lessened by the amount of trouble which is taken to "balance" (otherwise to "fudge") the survey after it has been plotted, in order to make it close, by averaging the total error amongst the various lines and angles. The impression is irresistible that it would be far better to make an accurate survey in the first instance, and it is difficult to follow Mr. Nugent in his summing up of the situation, after devoting no fewer than ninety pages of his book to compass surveying, in the words: "For country work, generally speaking, unless the ground is entirely clear it is waste of time to use the more accurate instruments." Theodolite traversing with the aid of traverse tables should be little less rapid, and very much more exact.

In other respects, some of the American methods are distinct advances upon those in use in this county. The employment of the 100ft. (or longer) steel tape in place of our heavy chain has been for many years advocated here; but in America it is usual, and the tape is made the more useful by an extra foot divided into tenths being added at one end, thus bringing the lineal measurements into agreement with those on the levelling staff.

Some of Mr. Nugent's suggested forms for Field Books—we do not know whether they are common American types or new ones of his own devising—are remarkably good; but there is little opportunity in a limited notice such as this of calling attention to more than one prevailing common feature which they possess in having the right-hand pages of the field books alone ruled for the usual entries, the left-hand pages being left blank for notes and sketches. Thus for an ordinary chain survey the book when open shows its right-hand pages only ruled with a central coloured line to represent the chain.

The American instruments, though differing in detail from those of English make, show little advance uponthem so far as can be judged from illustrations and descriptions; and probably they differ nothing at all in reliability. It seems to be customary to use a sighting target upon the levelling staff, which can be slid up and down by the staff-holder so as to make long levelling sights possible—one would think at a certain sacrifice of accuracy for ordinary section levelling, but with gain of speed, at least in contouring, which is much more commonly employed than with us. It would be a great gain in England if contour lines were more frequently shown than they are, especially on site plans for competitions, the American practice being in this matter much to be preferred.

On the whole, Mr. Nugent is to be congratulated in having produced a careful and exhaustive work, which can be read with most advantage by the surveyor who is already skilled in practical work and wishful to obtain a knowledge of the complex theories upon which much of it is based.

"Plane Surveying," by Paul C. Nugent, A.M., C.E. New York: John Wiley & Sons. London: Chapman & Hall, Ltd. Price 15s. nett.

THE TOWN HOUSE, COPENHAGEN. MARTIN NYROP, ARCHITECT.

Surveying & Sanitation.

Mr. John Richard Eve died recently. He was a well-known land agent and surveyor of Bedford, having an extensive practice extending over a large area. Born in 1833, he assisted his father, also a valuer, for many years, and in 1865 joined the firm of Page & Harding, of St. Albans and Hitchin. In 1886 he dissolved partnership and moved to Bedford where later his son, Mr. Trustram Eve, joined him in partnership under the present title of J. R. Eve & Son. Mr. Eve was widely known as a surveyor and agriculturist. For many years he had been a member of the leading societies in connection with his profession, notably the Surveyors' Institution and Farmers' Club, of which latter he was chairman in 1901. For the last twelve years he had been president of the Valuers' Association for Hertfordshire, Bedfordshire and Buckinghamshire, and for a long time took a leading part in the council of the Bedford Agricultural Society. He had a large practice as a rating surveyor, his services being frequently retained as witness in rating and other cases.

ST. MARK'S CAMPANILE.

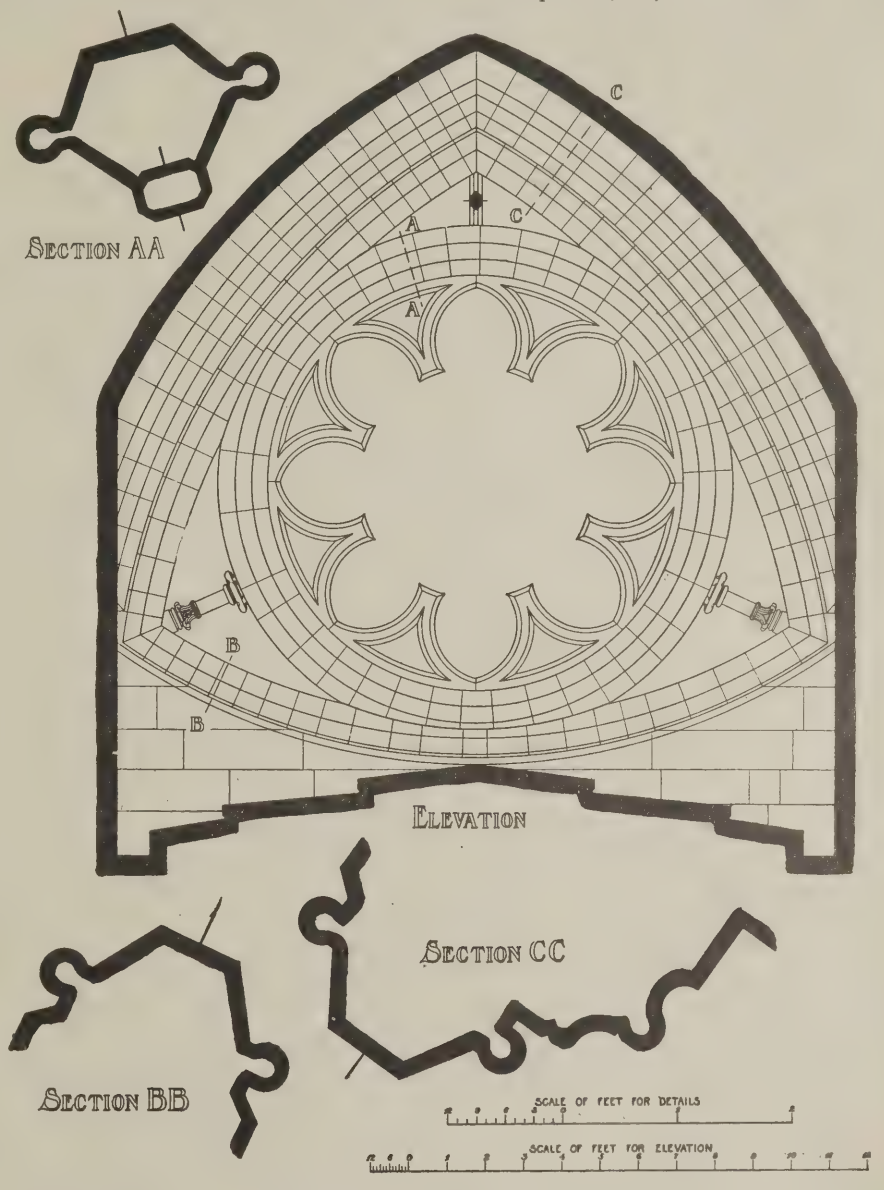
THE ROYAL ACADEMY OPENS A SUBSCRIPTION.

SIR EDWARD J. POYNTER, P.R.A., writing to the "Times," says that artists feel the destruction of St. Mark's Campanile as a personal loss, so conspicuously was it the key to the endless pictures which the beautiful city presents from wherever it may be seen, and so associated was it in our minds with the romance of its exquisite surroundings. Its rebuilding, thinks Sir Edward, is a necessity, if only for its place in the panorama, and has been voted by acclamation. There seems to be a technical illegality in the way of the Royal Academy using any part of its funds for such a purpose, and Sir Edward Poynter was therefore bound to make his appeal for subscriptions towards the reconstruction, which it is understood is definitely decided upon, to the members of that body individually, and it has been enthusiastically taken up and warmly responded to. The co-operation of the general public is now invited. The treasurer of the Royal Academy, Mr. T. G. Jackson, R.A., has kindly signified his willingness to receive and keep in hand all donations sent to him and to deliver them to the proper authority when the time comes, and intending subscribers are requested to address their communication to him, at the Royal Academy of Arts, Piccadilly.

Other Buildings in Danger.

A correspondent of the "Scotsman" states that he has heard from the lips of one in the highest authority and position in Venice that even St. Mark's Church itself is not in a satisfactory condition, notwithstanding the Government maintains a school of mosaic workers in the church itself simply to keep the fabric in repair. When cracks have appeared, it is stated, they have been simply filled with cement, and the mosaics put over them, leaving the cause of the damage unremoved. It appears that the great vault above the gallery at the west end of the church, which contains frescoes of the Last Judgment, and more especially the vault next it, above the nave of the church itself, which has scenes from the Book of Revelation, stand both in need of urgent repair. The great cupolas, too, which give such an Eastern character to the church, are said to be out of order. These cupolas are all double —that is to say, the cupolas one sees outside are not those one sees inside the church. The inside cupolas are of brick, are comparatively low, like inverted bowls, and bear the mosaics. The outside cupolas, raised over them, completely covering them, are of sheets of zinc and lead, and are very high, cylindrical in form for two-thirds of their height. There is thus a large clear space between the inner cupola and the outer one that encases it. It is these inner cupolas that are out of order. For some time workmen have been repairing the one next the vaults spoken of above, which is that of "The Descent of the Holy Spirit at Pentecost." It is also said that the great central cupola, that of the "Ascension of Our Lord," the main cupola of the church, is also out of order. Three years ago the mosaics in this cupola were all restored, but if the cupola itself is in danger the reparation of them serves nothing. Commendatore Boni has appointed a special commissioner to examine and report.

The report that the great eastern window of the church of S. Giovanni and Paolo has fallen in is incorrect. Whilst a morning service was going on, a piece of the quatrefoil fell. An examination showed that the irons of the great window were very much corroded, and that they were too weak to support for long its weight. A secret door was also discovered behind the high altar, and a secret passage in the wall itself under and beside the window, all of which tended to weaken its support. Some cracks were also discovered in other parts of the building. There is no immediate danger, and the church is closed for repairs.



Another church that has been discovered to be wretchedly out of repair is that of S. Giobbe, the erection of which goes back eight centuries. This church stands in a poor quarter of the city, Canareggio, not far from the Ghetto, and nobody has paid any attention to it for centuries. It seems the bell-ringer endangered his life every time he pulled the bell-rope. The whole of the top of the campanile, where the bells are, is in a tumble-down condition. Of course the bells have been stopped and the church closed.

The campanile of San Stefano threatened a total collapse like St. Mark's, and all the houses around it were cleared of goods and people.

The list of the campanile is such that it almost hangs outside the tower. There was a fear that nothing could be saved, but now that the campanile is being bound up with poles and beams and hoops of iron, there is a hope of the possibility of saving the bells by lowering them down the campanile itself inside. The clock has been already saved.

More houses have been condemned. One at the Rialto, in Campo St. Bartholemeo, gives cause for alarm, whilst the instant demolition of another behind it at San Lio has been ordered, as it is sinking daily. Certain palaces, too, on the Grand Canal are being officially examined, but as yet no report of their state has been issued.

All the ecclesiastical property in Venice—churches, campaniles, &c.—belong to the State. Indeed, it is illegal for the Roman Catholic Church to hold real property in the land. The Government, however, entrusted the care of that property to the different church vestry boards. The young and able Marquis of Cassis, the Prefect of Venice, who represents the Government, has ordered the enquiry that has brought to light how lamentably neglectful of their trust these vestry boards have been. He has by a special decree dissolved that of St. Mark's Church, and probably he will have to dissolve all and commit the care of the ecclesiastical property entirely to civil boards.

WHEEL WINDOW, AMIENS CATHEDRAL. MEASURED AND DRAWN BY P. R. STRONG.

The Procuratie Vecchie, on the north side of the piazza of St. Mark, are in a worse condition than was suspected. A commission of twelve experts has been chosen. These Commendatore Boni has divided into six commissions of two persons, each charged with a minute examination of a separate part of the line of building, their reports to be given in in one week. Meantime he has ordered that two arches near the centre of the colonnade should be built up, in order that the pilasters that sustain them, which are cracked and broken, may be taken down and new ones erected in their places. He has also ordered the removal of the goods that are stored in the warehouses in the Procuratie, especially marbles, the weight of which is straining and damaging the buildings.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Formulae and Estimates.

HARLESDEN.—NOVICE writes: "What is the best book to enable me to work out the formulæ in Hurst's 'Pocket Book' for strains and stresses on roofs beams, piers, &c.? (2) Please name a book dealing with approximate estimates per ft. cube for different classes of work. (3) What would a church with 14in. walls, fair face inside and out, stone dressings to windows and chancel arch, without furniture, cost per ft. cube? (4) Do you consider a roof-truss as shown in sketch (not reproduced) sufficient for this span?"

(1) The formulæ given in Hurst's Pocket Book can all be solved by the aid of elementary algebra. A good book on this subject is Hall & Knight's "Elementary Algebra" (Macmillan, price 4s. 6d.). (2) "A Price Book for Architects and Engineers," by T. E. Coleman (E. & F. N. Spon, Ltd., price 5s.). (3) Churches are usually roughly estimated at per sitting. For a church such as you name the cost would work out at about £6 per sitting. (4) We cannot properly answer the question without knowing the roof-covering proposed. You can easily work out the stresses for yourself and the sizes of timbers and iron tie rods to bear them by the rules given in Hurst or Rivington.

Strength of Half Brick-Wall.

BRIXTON.—E. E. B. writes: "What load per ft. run can safely be placed upon a 4½in. partition brick wall constructed of Fletton bricks in cement stiffened by hoop-iron bond? The height of storey is 9ft. 6in., and the greatest distance from one return wall to return framed and board partition is 12ft. 6in. The wall itself is supported on a steel joist, and supports a fire-resisting floor above (4¾in. by 1¾in. rolled steel joists, 3ft. apart, filled in with coke breeze concrete). I originally proposed to use a 2in. by 4in. stud partition, but the district surveyor required a fire-resisting floor above. Hence the proposed alteration. A 9in. wall is undesirable, as it would increase the load upon the joist below, which is already calculated to take a stress of 6¾ tons in the flanges. Calculated load, including wind-pressure, comes out at something over 24¾ cwts. per foot run. See sketch (not reproduced)."

A 4½in. wall, 9ft. 6in. high, loaded uniformly along the top is under the conditions of a pier or column 25 diameters high. The maximum safe load on a short brick pier, Fletton bricks in cement, is 6 tons per sq. ft. Upon a pier 25 diameters high this will be reduced under the most favourable circumstances to not more than 1½ tons per sq. ft. In 1ft. run the area will be ⅜ of a sq. ft. making the maximum safe load per ft. run ⅜ by 1½ = ·5625 tons or, say, 11¼ cwt. per ft. run. The hoop-iron bond cannot be considered as adding anything to the virtual strength of the wall. A decision under the London Building Act recently held that a 4½in. brick wall was not an allowable construction as it could not be properly bonded (see the "Standard," 8th July, 1902). Whether or not the decision will be upheld in the superior courts, this construction is not suitable in the present case, and there are other objections to the arrangements shown in the sketch.

HENRY ADAMS.

Measuring Mouldings.

HESSLE, YORKS.—ACCURATE writes: "Will you please state the best way to get accurate details, full size, of Early English mouldings? I find working with lead rather difficult, as you cannot get the lead out without spreading it. Having got the full-size detail of a moulding, is there any convenient way of reducing them to, say, 1in. scale accurately?"

The Cymograph, Professor Willis's invention, affords the best means of getting accurate profiles of incut mouldings. This instrument is described and illustrated in R. Phené Spiers's "Architectural Drawing" (Cassell & Co.). It is not usual to make reduced drawings of mouldings, but a convenient way would be to employ a reducing "Cymograph,"; the ordinary method is to find points on the curve, from the full-sized details, and draw the rest by hand.

Clerk of Works' Power to Damage Materials.

BRADFORD.—LEEDS writes: "A clerk of works has condemned several pieces of wrought ashlar. Is he within his right in so spoiling the stones that they will not do for the position they were intended for; yet not so far damaging the stones that they cannot be utilised for some other purpose on the works?"

The clerk of works has no right to damage any other person's property, unless there is a clause to this effect in the specification or agreement.

Architects' and Surveyors' Charges.

WIGAN.—E. J. P. writes: "Where can I obtain a complete schedule of architects' surveyors' charges, &c.?"

In "Specification No. 5," price 5s. nett.

White Stucco.

MANCHESTER.—W. L. writes: "Is it possible to make up a cement stucco that when dry will be of a white or cream colour? On some work just completed the stucco is composed of 1 part Portland cement, 1 of sand and mixed with lime mortar. It has dried a dirty grey colour."

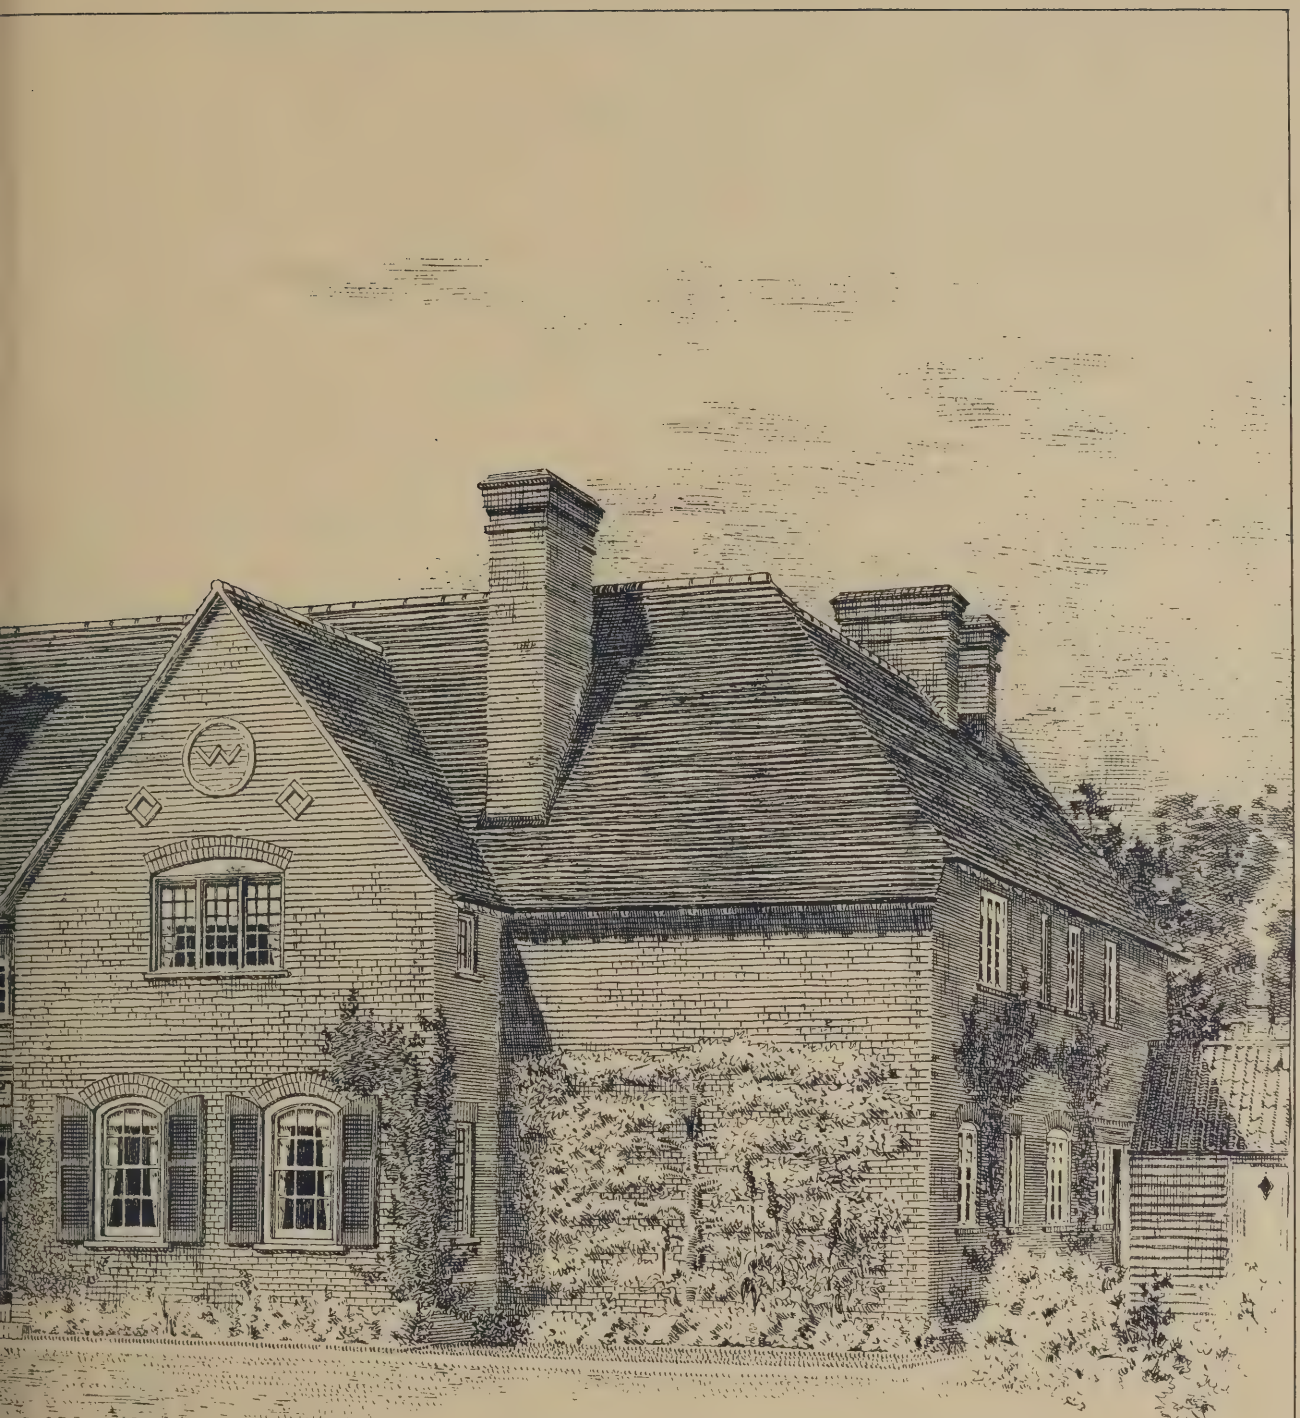
It is impossible to obtain a permanent white plastic surface for exterior work. Painting with a suitable oil paint will indurate the surface and retain the colour longer than whitewash. A fairly good white or cream-coloured surface can be obtained by using Portland cement in combination with white aggregates, such as silver sand, white spar, white marble sand, and Bath stone dust. Portland cement and sharp sand should be used for the floating coat, taking care that the joints of the brickwork are freed from lime mortar, and the whole surface thoroughly cleaned and wetted. The fining coat is composed of 2 parts of Portland cement and 3 parts of white aggregate. An extra white surface can be obtained by mixing the cement with a tenth part of well-sifted powdered whiting. The cement and whiting should be well mixed together in a dry state, and then the silver sand or other white aggregate added and thoroughly mixed before the mass is gauged. The fining coat should be finished with the trowel to get a close, smooth and impervious surface, to allow the rain to run off freely, and to resist the effects of rain and snow. A smooth surface helps the rain and wind to wash and blow off surface dust.

The Lady Chapel at Hexham Abbey.—A petition, accompanied by plans by Mr. Temple Moore, has been deposited in the registry of the Consistory Court, proposing to alter the east end of the choir and rebuild the Lady Chapel. The estimated cost is £10,500.

Law Cases.

Workmen's Compensation.—The case of *John Stones* v. *Richard Baynes* recently came before Judge Steavenson at the Ulverston County Court. This was an application under the Workmen's Compensation Act for the diminishing of a weekly payment. The applicant, John Stones, it was stated, was a revolving shutter manufacturer at Rosside, near Ulverston, and the respondent, Richard Baynes, was formerly in his employ as a joiner. The accident happened on the 18th August, 1900, and resulted in the loss of the left hand of the respondent. At the time the compensation under the Act was settled at 15s. a week, being the full 50 per cent. of his wages, his previous earnings being 30s. a week. Of course the loss of the hand had affected the man's working capacity over and above the question of its healing; but it was now submitted that the respondent was no longer totally incapacitated from work. He submitted that his Honour might reasonably say that he was able to earn, say, £1 a week, which would entitle the applicant to have the present weekly payment reduced accordingly. In support of his application he quoted the cases of *Davis* v. *Timmins* and *Challinor* v. *Smith* (p. 506, 1899, Queen's Bench reports, Vol. 2). His Honour did not think there were any grounds for reducing the award, and the case that had been quoted did not really apply. The man, it is admitted, has not got any work to go to and there is no suggestion that there is work ready for him which he declines to take. Therefore the application was refused. Costs were allowed on the B. scale.

Wood Roads: Important Decision.—An important decision to the public and to local authorities was given in the City of London Court recently by Judge Lumley Smith, K.C., and a jury. A lady sued Messrs. William Griffiths & Co., Ltd., contractors, to recover £50 for personal injuries suffered by her. She was crossing Seven Sisters Road on March 15th last when she slipped and fell, injuring herself very much. She was laid up for some weeks, and had to go to Margate to recuperate. She now demanded compensation. The defendants had just repaired the road as contractors for the Islington Borough Council, and the plaintiff complained that they had thrown small stones on the top of the wood paving, thus making it slippery. The stones, it was said, should have been put on while the pitch which covered the wood was warm and soft, instead of waiting until it became cold and unimpressionable. A glassy, slippery surface was the result. Cement should have been used instead of tar. For the defendants, counsel explained that the case was of much importance to all local authorities, as the only method of laying woodpaving was being assailed. All the borough councils and their contractors used pitch instead of cement, and the defendants ought not to be held responsible for the plaintiff's accident. Roads must be repaired and the public must take more care when crossing roads newly laid. Mr. Barber, the engineer to the borough of Islington, said the work was done quite satisfactorily. The jury, however, in awarding the plaintiff £25 for her injuries said they considered that cement should be used. Judgment accordingly, with costs.



A New Presbyterian Church at Builth Wells is being erected at an estimated cost of £4,500 by Mr. D. W. Richards, Newport, from plans by Messrs. Habershon, Fawckner & Groves, of Newport and Cardiff.

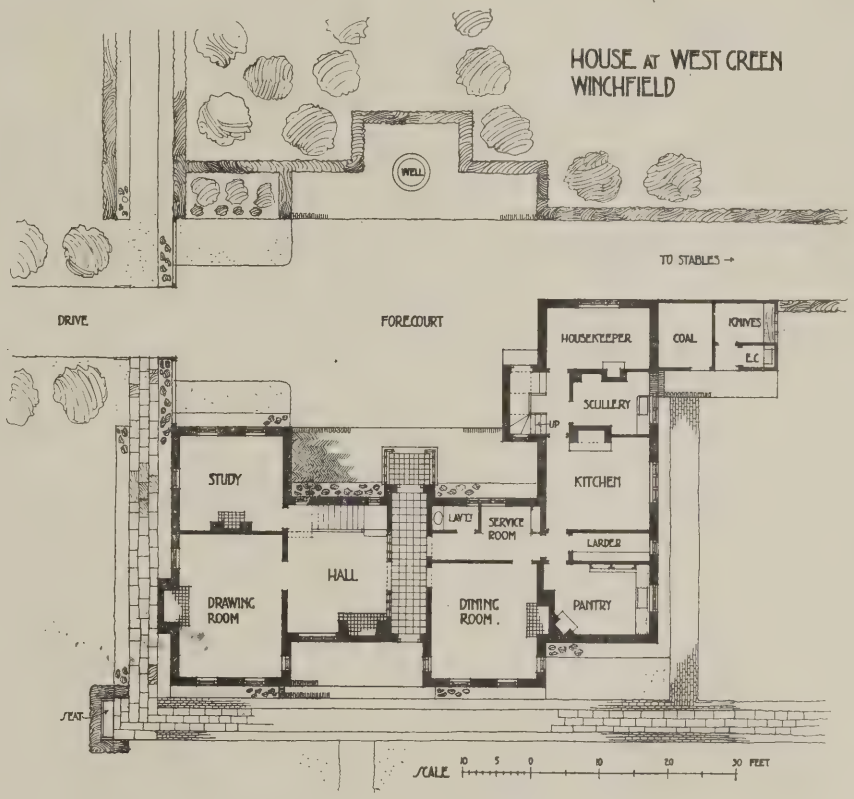
Bricks and Mortar.

Aphorism for the Week.



We prefer to adhere to the judgments pronounced by distinguished intellects rather than to use their method of examining facts, so as to reach our own conclusions.

VIOLLET-LE-DUC.

Our Plates. THE house at West Green, Winchfield, Hants, was built for Dr. Wills. The drawing which we publish was exhibited at this year's Royal Academy. The materials used were red bricks and tiles. Sash windows are used for the ground-floor sitting-rooms, to allow for sun shutters. The builders were Messrs. Mussellwhite & Sons, of Basingstoke, Hants, and the architect was Mr. Ernest Newton, of 4, Raymond Buildings, Gray's Inn, W.C.

British Copyright in Canada. A RECENT decision by three judges of the Supreme Court of Appeal at Ontario is to the surprising effect that the British copyright owner has no protection in Canada. The Berne Convention, to which Canada is a party, and the Act of 1866, which aimed at protecting British copyright in the colonies, seemed to have placed the matter on a satisfactory footing, and it is suggested that the judgment of the Court could only have been arrived at in consequence of the law being drafted in a faulty manner. In any case the decision is one that seriously threatens the interest of British copyright holders and places Canada in a position of unfair advantage, which we have no doubt that she does not desire; for, while she continues to receive copyright protection in Great Britain, she need give nothing in return. This is by no means in accordance with the true attitude of the Dominion, as we have lately had full reason to recognise, and the rectification of the matter might have been safely left to the good feeling of the Canadians themselves. Still, cases of hardship and injustice might arise in the meanwhile, and a Society has therefore been formed, under the presidency of Sir Edward Poynter, who has the support of several distinguished artists and others, for the purpose of protecting the copyright interests of artists and art publishers in the colonies, and of presenting a petition to the British Government to have the terms of the Berne Convention carried into effect. A deputation of this Society recently waited on Sir Wilfrid Laurier, who promised to give the matter his full and most sympathetic consideration, and it may, therefore, be taken for granted that the end which the Society has in view is practically attained, and that whatever legal bar there may be to a reciprocal copyright relationship between Great Britain and Canada will be promptly removed.

Portable Houses. ON the waste ground in Prince Consort Road, South Kensington, behind the Imperial Institute, a small portable and transformable house, constructed on the Silbiger system, has been erected. This system, it is claimed, offers distinct advantages for buildings in new countries where, as now often happens in South Africa, skilled labour is scarce and means of transport deficient. Buildings on this system are composed of panels, preferably of wood, all of the same size (about 3ft. wide by 8ft. or 10ft. high) and supported by uprights. An ingenious device is adopted to fasten the panels to the uprights; each of the latter has two panels clamped to it by the aid of two or three bolts with thumbscrews, and the various surfaces are so shaped at their meeting point that, when the screws are tightened, a firm strong joint is produced on much the same principle as a carpenter's dovetailed joint. The panels being uniform, any one may be used in any part of the house not only for outside walls but also for inside partitions; thus the trouble of numbering the different parts for erection is avoided, and in the event of some of them being lost or damaged in transit, the whole work of construction is not delayed, but the house can be erected, though perhaps short of one room or of a partition. Further, the doors and windows are of the same size as the panels, and are interchangeable with them; hence the owner of one of these houses, whenever he is inclined, can alter the position of his doors and windows, and, indeed, transmogrify the whole of his dwelling, inside and out, simply at the cost of slackening a few thumbscrews and moving the panels, &c., into their new positions. No foundations are required, but the wooden feet which carry the uprights and the timbers of the floor must naturally be placed on the level. The roof is borne by the uprights, to which it is securely fastened, and ingenious safeguards are provided against the entrance of rain or damp. Extremes of temperatures are guarded against, and the house made a real habitation, first, by using wood, a poor conductor of heat, as the constructive material, and, secondly, by making the walls double and the roof triple. Ventilation is also well provided for. The cost of such a house, containing four rooms, each 10ft. sq. and each fitted with a bed table, and two seats which can be folded up flat against the wall when not in use, is stated to be about £135, and the weight is 4 to 4½ tons, all in pieces no one of which exceeds 77lbs.

ERNEST NEWTON, ARCHITECT.

Coggeshall and the Teys. THE quarterly meeting and excursion of the Essex Archæological Society, took place recently. The remains of the famous Coggeshall Abbey were first inspected. The Cistercian monastery was built in the thirteenth century, of rubble with brick quoins, and has widely splayed windows, with moulded brick dressings. The remains are said to afford the earliest instance of mediæval brickwork in the country. The principal remaining fragment is part of an arcade running east and west. Only one pointed arch, however, remains intact. This is constructed of curious unmoulded bricks. Its pillar is also of brick. Portions of two massive walls likewise exist, and carved stones, including a late Norman capital, are scattered around. Paycock's House and the carved oakwork of other domestic buildings in Coggeshall, and the church of St. Peter-ad-Vincula were then visited. This church was erected during the fifteenth century, and is of flint and stone, consisting of a nave, with both aisles of five bays each and as many clearstory windows on each side, a chancel with aisles, and an embattled west tower with corner turret containing eight bells, dating from 1681. Each aisle has a door, four side windows and a west one. The south porch has a vaulted roof and chamber above. The bosses of the vaulting are of various designs, the centre one being a pelican in piety. The chancel contains three sedilia, three clearstory windows on each side, and a fine seven-light perpendicular east window. In the south chapel is a piscina and an altar tomb, and a stoup beside the door. There are modern side screens of oak richly carved, and several monuments and brasses. An excursion was subsequently made to Great Tey Church (St. Barnabas). This church has a massive central tower of pure Norman work and a chancel with aisles of the Decorated period, the nave having been destroyed previous to 1829. The tower is square, with corner turret stair and numerous small Norman windows, having sides of Roman tile. The east and west arches are Norman; the others, which lead into small transepts, are pointed. The south transept contains a piscina and a Decorated window, and in the north transept is a rather good three-light Decorated window. The font is Perpendicular, and there is an old carved lecturn and some ancient benches. Little Tey Church (St. James), a very small Norman building, was also inspected. This church is curious, inasmuch as the nave and chancel are under one roof. The north and south doors are Norman, the latter door having plain round mouldings, with its tympanum ornamented in a lozenge pattern. At Kelvedon, St. Mary's Church was visited. This building is chiefly of fourteenth-

century date, but it was considerably altered during the fifteenth and sixteenth centuries. The arches are of Early English, and they rest on columns which show late Norman workmanship. The easternmost arch rests on a beautiful corbel. The rood-stair remains, and there is a squint on each side of the chancel arch. The chancel contains an elegant crocketed piscina, and the nave roof is very fine and of ancient timbers, with supporting figures.

IN DANGER OF FIRE.

RISKS AT THE BRITISH MUSEUM.

MR. O. ELTZBACHER calls attention in the "Times" to the risk of fire at the British Museum. To the right of the entrance hall are situated three large adjoining rooms open to the public, the two rooms of the Grenville collection and the magnificent King's library. Adjoining these is a number of large rooms, such as the newspaper room, the catalogue room, the music room, and the large room and various minor ones, all of which rooms have not been constructed on "fireproof" principles. The flooring is wooden and seems everywhere hollow, thus increasing the danger in case of a sudden outbreak of fire; the numerous show-cases and the huge book presses with which the walls are lined, as well as the fittings, the door and window casings, and the doors themselves, are made of wood, and the ornamentation of the ceiling seems also to be largely constructed of inflammable material. Whilst the huge store of less valuable books is housed in the newer part of the library, which is entirely constructed of stone, iron and glass, and apparently quite up to date, the most precious part of the collection, embracing innumerable first editions, manuscripts and documents, is kept in those antiquated, largely wood-constructed rooms. Whereas the Egyptian and Greek sculptures of unburnable rock are exhibited in fireproof rooms and repose on stone floors, the most fragile and perhaps most valuable part of the treasures in the Museum is stored in highly inflammable rooms, in which the hollow flooring is even waxed, increasing thus the danger in the event of a fire. As the arrangements for fire prevention are so defective, it might be expected that the best measures for fire extinction should be found at the British Museum. However, no automatic sprinklers, which have proved their great value, are to be found in the most exposed part of the building, but only a few hydrants. In fact the precautions taken in that part of the Museum to prevent and to combat fire seem to be only those which were used in a former age. It might be said that the heating arrangements at the British Museum are such that an outbreak of fire from that source is unlikely. That may be or may not be, but it does not diminish the danger from lightning, arson, or from short circuit. Whether the latter contingency has been properly provided against seems also doubtful. Burglary is also not sufficiently guarded against.

Mr. Somers Clarke's Letter.

Mr. Somers Clarke, F.R.I.B.A., in reply to this letter says:

"The structure was built before fireproof construction had been as well studied as now. Those who designed and built it are not to blame that its roofs and floors are chiefly of wood, but the question may now be asked how far the structure might not gradually be changed in certain details, so that a very real danger may be greatly reduced. In the Egyptian Gallery, on the upper floor, considerable changes have recently been carried out. Windows have been bricked up and skylights have been pierced through the roofs. Here was an opportunity of making a change for the better, room by room. Has this been done? With the exception of the National Portrait Gallery, which, I believe, has its roofs as well as its floors of incombustible materials, there is probably not a museum or gallery in London which has not a combustible roof, and yet the danger arising from sparks and embers falling on timber and lead roofs is but too well known. At the British Museum there is an admirable system of hydrants by which, at a moment's notice, the outer surfaces of the roofs can be flushed.

"Fortunately there has not been occasion to bring them into use, but in the event of a serious fire in the houses surrounding the Museum on three sides we can look only with a little less dismay on the flooding of the roofs with water—much of which would certainly come through—than on the danger from the fire itself. The vast dome of the reading-room is but a combustible beehive of lath and plaster with iron ribs. We may ask what is being done (in the direction of rendering them incombustible) with the roofs in the new parts of the Victoria and Albert Museum. I understand that an efficient system of lightning conductors does not exist at the British Museum."

Mr. Hedges on Danger from Lightning.

Mr. Killingworth Hedges, M.I.C.E., hon. secretary of the Lightning Research Committee, continues the condemnation of the want of protective measures. "The sole protection against lightning is a few isolated conductors ignored, so I was informed, by the lightning when the roof was struck a few years ago; although the damage was slight owing to the metallic covering, from which the flash travelled by means of a rainwater pipe to earth, the risk was great. On the same date as your correspondent's letter you report the total destruction of the thirteenth-century tower of Swanscombe parish church by fire, caused by the lightning being diverted into the building; at the British Museum the electric-light mains would form an excellent path, should even a portion of a lightning stroke find an entrance, and a most disastrous fire might occur. In a paper read at the British Association meeting last year I drew attention to the unprotected condition of the Victoria and Albert Museum, South Kensington (struck by lightning in 1900, the damage, however, being confined to the destruction of an electric light cable), also to the National Gallery and the Tate Gallery; but the Office of Works appear to do nothing, and refused last year to spend the trifling amount required to protect the Chapter House, and include it in the modern system of conductors, which I designed for the protection of Westminster Abbey. Abroad, especially in Germany, great attention has been paid to the safeguarding of all public buildings against lightning stroke. The regulations vary with the different local authorities; in Frankfurt the municipality have special rules. The following is an extract:—'Houseowners must have their lightning conductors examined at least every two years, and must report alterations or repairs to a conductor; designs and specifications of proposed erections must be submitted to the local board, and for the accuracy of the same the houseowner is responsible.' The annual expense for upkeep in the case of a public building would be sufficiently provided by, say, a 1 per cent. rate on the sum spent for structural repairs, and this amount could be treated as an insurance. It appears anomalous that thousands should be spent in purchasing the property next to the National Gallery so as to minimise the danger of fire by isolation while the building itself has only the most elementary form of lightning conductor, and is just as liable to be struck as the Cavendish Laboratory, Cambridge, which recently escaped destruction by the mere chance that the gas had been turned off at the meter, so that there was no escape of gas from the pipe which was fused by the lightning as it side-flashed from the copper conductor on its way to earth."

Mr. Aston Webb, A.R.A., writes: "As architect to the new buildings at the Victoria and Albert Museum, I am in a position to reassure Mr. Somers Clarke, as I have been from the commencement instructed by the Office of Works to construct all the new roofs of these buildings with fire-resisting materials."

Engineering Notes.

Mr. Charles H. Beloe, civil engineer, of Liverpool, who carried out many important works in various parts of the country, died recently. He was regarded as an expert in drainage matters, and acted as engineer to the International Water and Sewage Purification Company of London. He was author of several standard treatises on the construction of reservoirs and town water-supplies.

A New Bridge at Barmouth.—The Cleveland Bridge and Engineering Co., Ltd., of Darlington, who are now engaged upon the erection of the new high-level bridge across the Tyne, have just completed the erection of a new railway bridge across the estuary of the Mawddach, at Barmouth, for the Cambrian Railways. The new bridge is supported by steel cylinders, which have been sunk into the granite below the bed of the river, a depth of no less than 100ft. below high-water mark. The new bridge has been built round the old one, and the work carried on in such a manner that the railway traffic has not been impeded during the two years it has been in progress.

A Scottish Mountain Railway.—The Leadhills and Wanlockhead Light Railway is nearing completion. Every traveller to Scotland by the West Coast route knows by sensation, not always pleasant, the "Beattock Bank" which the Caledonian train has to ascend and descend in crossing the watershed of the Clyde and Tweed from the lowlands of Dumfriesshire. From Beattock station to Elvanfoot, the junction for the light railway, is nearly 16 miles, and in that distance the train has climbed up some 700ft. to the summit (1,029ft.) and descended again to an altitude of 895ft. Step out of the main line carriage at Elvanfoot, and a tank engine, whose normal load in two small coaches, will lift you another 500ft. in half an hour, and deposit you on one of the most picturesque and health-giving spots in the British Isles. The total length of the completed line is $7\frac{1}{4}$ miles. The first $5\frac{3}{4}$ miles, connecting Elvanfoot and Leadhills, the Earl of Hopetoun's mining village, were opened last year. Since then the construction of the additional mile and a half of track necessary to join up Leadhills to Wanlockhead, the Duke of Buccleuch's mining village, has been steadily proceeded with. This section of the track presented no very great difficulties to the contractor. It is only a gently swelling ridge of breccia that separates the two villages, which lie on either side of the watershed. Leadhills stands at exactly 1,412ft. above the sea, Wanlockhead at exactly 1,417ft. Starting from the former the gradient is 1 in 40 to the summit, and the descent to the latter is made at the same angle, a slight modification of the vertical curve being obtained by a comparatively shallow cutting. In Elvan Valley the engineer has been compelled to hug one shoulder of its environing hill-walls and follow the right-hand curve described by the burn, or whatever natural agent preceded it. The very viaducts are half-circles; guard-rails are so usual that their occasional absence excites notice.

MEASURING-UP BUILDINGS.—II.

By ROBERT W. CARDEN, A.R.I.B.A.

(*Concluded from p. 15, No 393.*)

IN continuation of the notes upon measuring up old buildings for plotting to scale it is now necessary to add a few remarks upon measurements for sections and elevations. As a fundamental rule, it may be said that where elevations as well as plans are required the plans should be so thoroughly plotted down that no horizontal measurement need be added upon the sketch elevation. This is desirable, not only so as to ensure that every dimension is taken in its proper place, but also because the absence of figures which might have been taken elsewhere tends to produce a less complicated drawing of any elevation. Even with these precautions the simplest sketch of a front is bound to contain a confusion of lines: this will be clear from an inspection of Fig. 3.

Sections are generally best measured through a staircase, especially if the flights are regular and the landings come exactly in tiers. Space is not available for complete plans of all floors of a building to be given, but the staircase is given in its entirety, as it has apparently been altered or reconstructed since the houses were first built, and one staircase made—and very awkwardly—to serve two houses, except upon the top floor, where each has its own attic stairs. The height of each floor is noted upon the plans and the thickness of the floors, as these form useful data from which the rough elevation can be drawn with a nearer approximation to truth, and save much trouble later on. All items are totalled and checked immediately as explained in the previous article. All stairs should be carefully numbered and *intelligibly* entered, and it is better to always draw the right number on the sketch as well as figure the total in each flight, and it should be recorded whether these notes include for either or both landings, as a step too few or too many is a frequent cause of inaccuracy. In plotting which is intended to be incontrovertibly correct it becomes necessary on each plan to have two measurements taken, which being one over the other ought theoretically to be on different plans. This measurement is marked A A on ground plan, and is represented by a firm and a dotted line; the firm line fixes the start of the flight to basement below the winding stairs, and the dotted line indicates where the landing above begins, and consequently fixes the upper end of the flight to the first floor. This precaution may be omitted where the walls are known to continue unbroken to the top of the building, but it was required here, as the through dimensions were found to vary considerably. It may be noted incidentally that in the staircase from ground to first floor the first flight is 3ft. 1½in. wide, the second 3ft. 3in., the third 3ft. 10in. and the fourth 3ft. 3in.

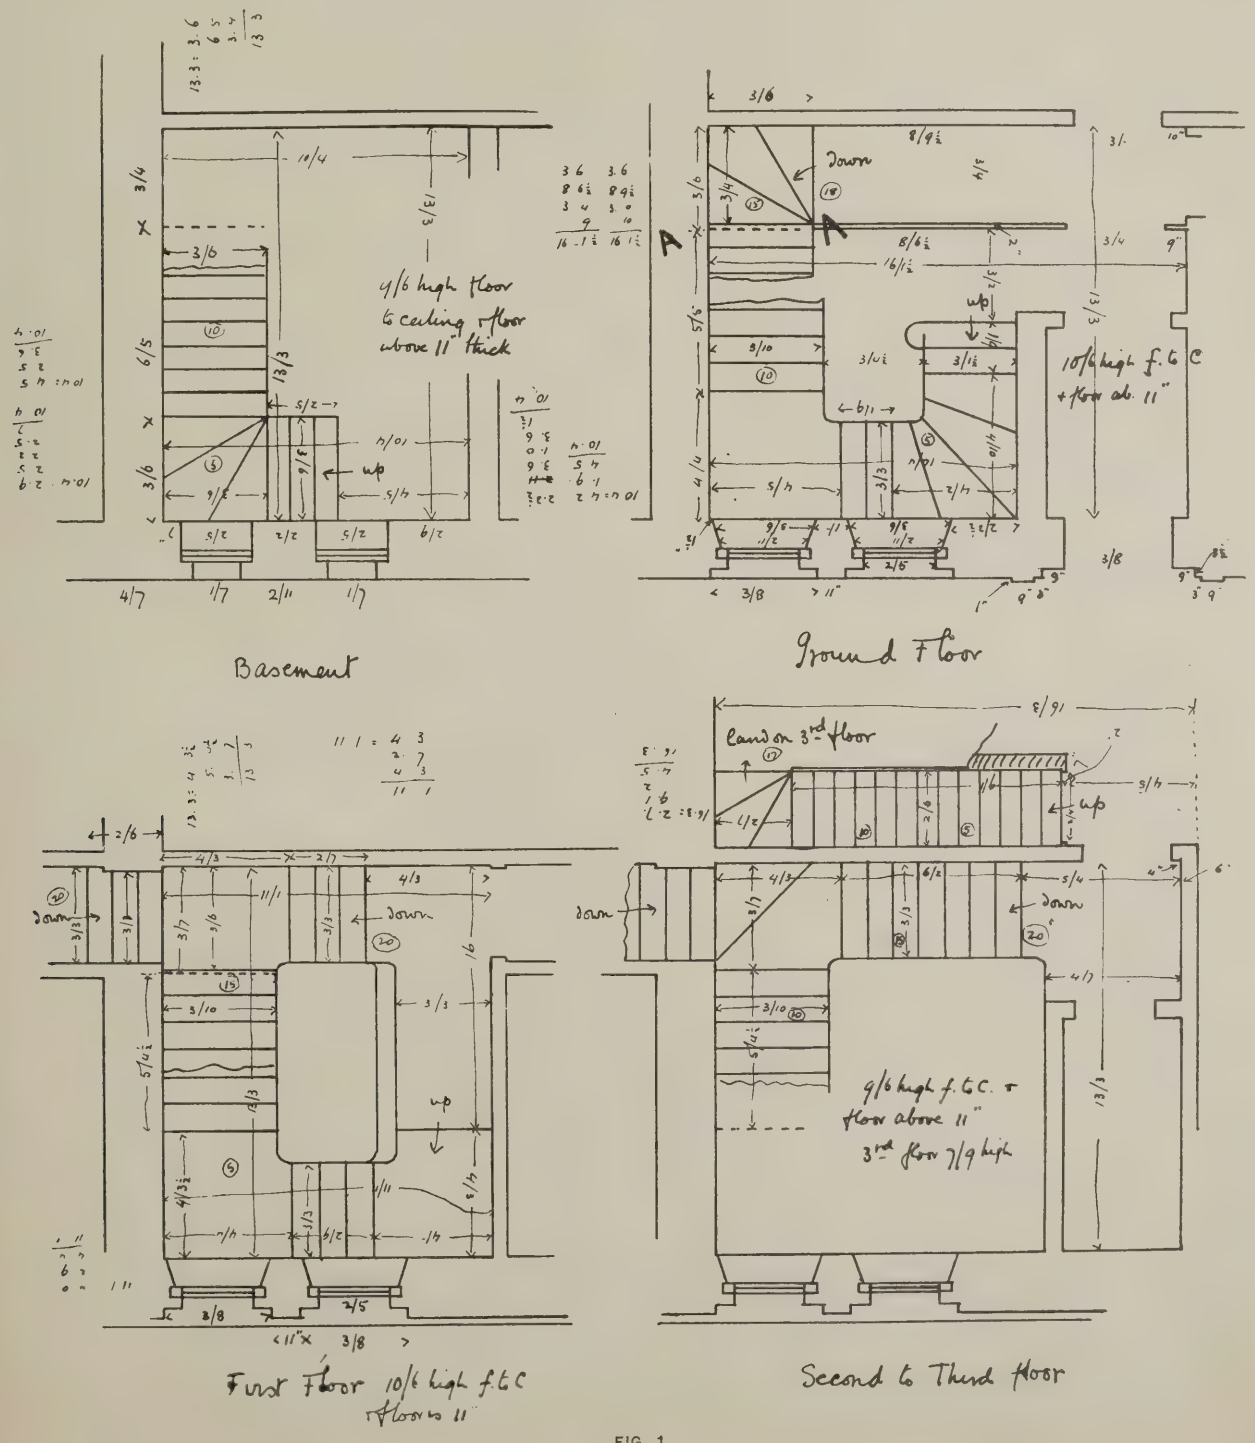


FIG 1.

Turning to the section (Fig. 2), only those portions which affect the stairs and the measurements of the front elevation have been figured, so as to avoid confusion. The stairs are numbered as a check, and all the numbers in each case are placed upon that portion of the drawing which represents the tread, as errors may otherwise occur; and where possible check heights are taken to any definite stair, so that by the application of these checks any mistake in the number of steps will be immediately revealed. The horizontal measurement of a sloping flight of stairs is not always easy to obtain, but here the difficulty did not arise, as no flight was more than 4ft. high, so that the dimensions could be taken with a tape and a plumb-line dropped to the riser of the lowest step. And here it may be added that measurements are taken from riser to riser and from string to string, *not* from nosing to nosing. Had this been an ornamental staircase, the ramps of the strings and the handrail and the balusters would have been required as well. Handrails should be measured vertically on the landings, and at right angles to the slope in flights, the dimension being taken to a definite point, say, the internal juncture of tread and riser. On the right-hand side of the section the main dimensions of the internal front are given, so as to form a check on the accuracy of the external ones. The internal height of the roof is also given, though it is unnecessary, as the height of the gable is obtained in this case by direct measurement from ladders. Frequently, however, as in a hipped all-round building, no such measurement is available, and internal scaling must be resorted to. It should always be remembered that a brick wall or chimney shaft is the best device for measuring not easily reached heights, where absolute accuracy is not required; for as each four courses of brickwork rise 1ft. it is only necessary to count the courses and divide by 4 for the nett height. The present building being covered with cement, direct measurement had to be adopted except in the chimney cap. Internal and external heights can be compared by measurements from window to window (vertically), but a true section through each sill must be first obtained so as to form a basis.

Although taking a little more time, it is well worth while in the outset to draw out the sketch elevation approximately to scale, obtaining the measurements from the plans and section (or the notes as to height inscribed on the stair portion of plan), as it is better to work upon terra-firma than to stand in mid air with one arm embracing a swaying ladder while trying to add details for which little or no room has been left on the paper; for when the whole elevation is already delineated spaces will be left where the details may be drawn out to a larger scale near their real positions, and the use of a number of unruly sheets of sketches avoided. A scale of 4ft. to 1in. is usually best for the main dimensions, heights of windows and similar items, but cornices and ornaments require to be taken to a larger scale, the exact amplitude of this latter depending entirely on the amount of detail required. In the example given the mouldings were all executed in cement, and not only was it not necessary to record them, but they were not worth the trouble, and they are consequently set down only with the projection from face of wall and the groups of mouldings noted. But for measuring old work the mouldings should be drawn out full size, all projections taken with rule and plumb-line, and the curved mouldings taken with callipers. There remains little more to be said, except that the external dimensions on Fig. 3 tally exactly with the figures on the section, and thus each proves the other to be correct. Most of the work in a simple building like the one illustrated can be measured from the various windows, but in larger edifices ladders and even scaffolding would be necessary, while, as in church steeples, there will be inaccessible points requiring the use of a clinometer or theodolite, which however is beyond the range of the present article. Wherever possible a photograph should be taken of the elevation to be measured, as, no matter how bad the result may be considered as a photograph, as a representation of the building it is unimpeachable, for, like the historic George Washington, the camera cannot tell a lie.

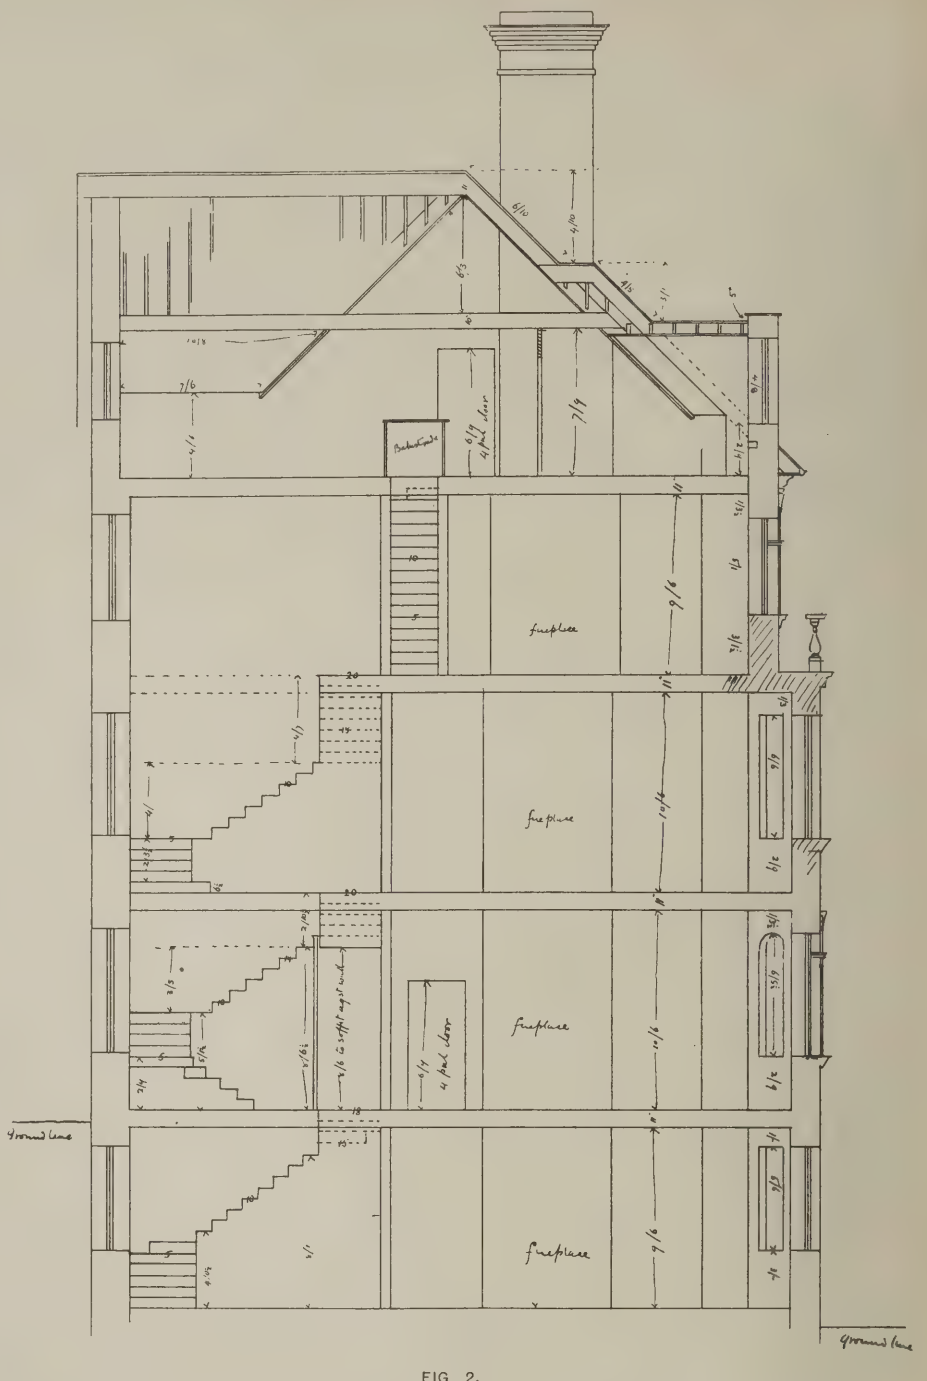

FIG 2.

A New Isolation Hospital at Repton is being erected in Sandy Pit Lane, Etwall, from plans and specifications prepared by Mr. A. Eaton, of St. James's Street, Derby. It will contain an administrative block, scarlet-fever block, observation block, laundry block, and engine house, with stabling, &c., and will afford accommodation for sixteen patients. The contract for building is £6,630. Messrs. Radford & Greaves, of Derby, are the contractors, and Mr. George Haywood, of Finden, is clerk of the works.

Builders' Notes.

Mr. Charles Chadwick, contractor, of Sheffield, died recently at the age of seventy-one years. He was born at Batley, near Dewsbury. He was apprenticed in the slating, plastering, painting and decorating trade, and when out of his time he entered into partnership with his uncle, the late Mr. Samuel Harrison. The partnership was dissolved in 1877, and since then the deceased carried on the business.

Plumbers' Apprenticeship.—At the half-yearly meeting of the Central Board of the National Association of Master Plumbers of Great Britain and Ireland, at Huddersfield, the president, Mr. W. L. Harrison, R.P., read a report of the work of the Educational Committee with reference to the form of indenture for apprentices, which had been drawn up in conjunction with the Worshipful Company of Plumbers. Hitherto there has been great laxity in the trade throughout the country respecting apprentices. The

form of indenture was adopted, providing for a seven years' apprenticeship, unless the lad has been previously pursuing his education to fit him for his trade at a technical school, on conditions varying according to localities.

Mr. John Fenton, builder, of Blackpool, died recently. He was born at Little Marton fifty-five years ago, and went to Blackpool at the age of twenty-six years. He first established and carried on for many years a prosperous grocery trade, but about nine years ago he entered into the brick-making and building business. In this line he met with marked success, the firm of J. & R. Fenton being well known throughout the town.

Portland-cement Grouting: "Killing" and "Aeration." — Sir Edwin Durning-Lawrence recently wrote to the "Times" with reference to the use of Portland-cement grouting for the fallen Campanile of St. Mark's, Venice (see p. 424 of our issue for August 13th). Mr. Fred A. White, chairman of the Associated Portland Cement Manufacturers (1900) Ltd., now writes calling attention to Sir Edwin's inadvertent misuse of the term "killed." "In saying that Portland cement should be 'killed' he advocates what he would be the first to condemn. This term is used to express the action of over-watering cement in gauging it. The effect of mixing with the cement powder more water than it can assimilate for the purpose of crystallization is to interrupt and even to counteract the setting process, and thus to prevent the attainment of eventual hardness. Manufacturers look upon this as a danger to be guarded against in the testing of cement. Material of the finest quality may be made to appear worthless if the making of briquettes or pats is in the hands of an ignorant, inexperienced or careless tester. The precaution Sir Edwin rightly urges, and correctly describes, is called "aëration."

Floor Tiles in Paraguay.- According to a report by the French Chargé d'Affaires at Asuncion, builders in Paraguay have recently taken to replacing the defective floor tiles made in the country, and which, until then, were alone used for flooring purposes in Asuncion, by tiles of foreign origin. Ceramic tiles (in compressed cement, earthenware or baked clays) would find, it is said, a certain opening in Paraguay, as the climate of the country necessitates the use of tiles in preference to woodflooring, and the consumption of this article is increasing every day.

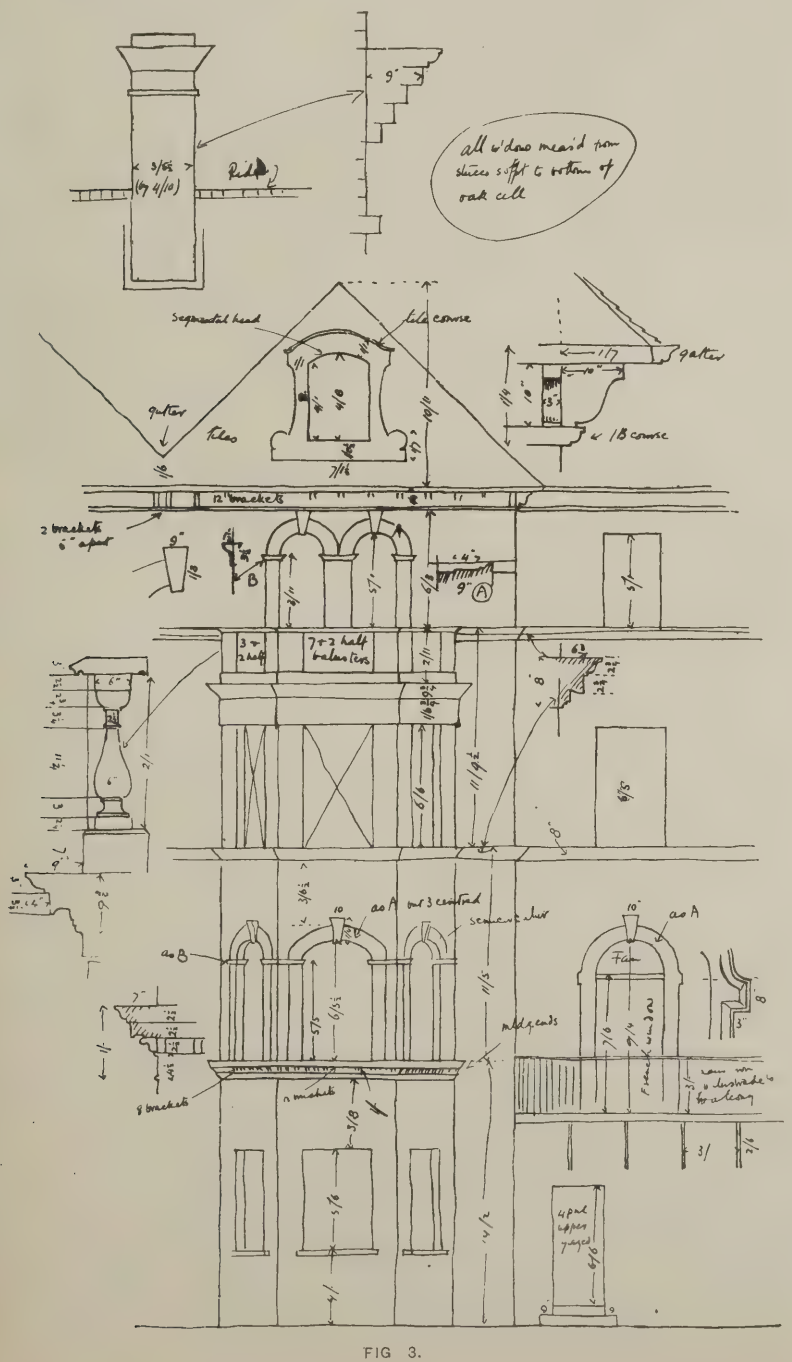

FIG 3.

New Patents.

These patents are open to opposition until September 30th.

1901.—Pipe Joints.—15,284. C. H. W. Biggs, Glebe Lodge, Champion Hill, S.E. The ridges on each pipe which serve to retain the liquid cement are formed spirally, the object being to secure a greater resistance to rotary and axial movement.

Toy Building Blocks.—16,200. O. Nentwig, Neustadt, Upper Silesia, Germany. The bricks or blocks, instead of being loose, are put together with **T**- and **L**-irons which fit into grooves in the blocks.

Ventilating Apparatus.—17,467. J. Keith, 27, Farringdon Avenue, and W. W. Wardle, 32, Somerfield Road, Finsbury Park; both of London. This invention consists of a fan or blower combined with a slotted rocking chamber analogous in action to a punkah. By these means the indrawn air is widely diffused into the apartment.

Brackets for Lavatory Basins.—18,453. G. D. Innes, Bennett's Ironfoundry Co., Ltd., Hyde Road, Ardwick, Manchester. To enable it to be adapted to basins of various shapes, the bracket consists of side pieces hinged to base pieces in combination with hinged corner pieces for supporting the front of the stand.

Plumbers' Traps.—19,183. W. G. Rennie, 6, Gillespie Street, Edinburgh. A lip is made on the bend of the trap with its bore tapered outwardly, so that the threaded metal socket which is afterwards inserted is drawn up very tightly when the cover or plug is screwed in: thus producing a thoroughly water-tight joint.

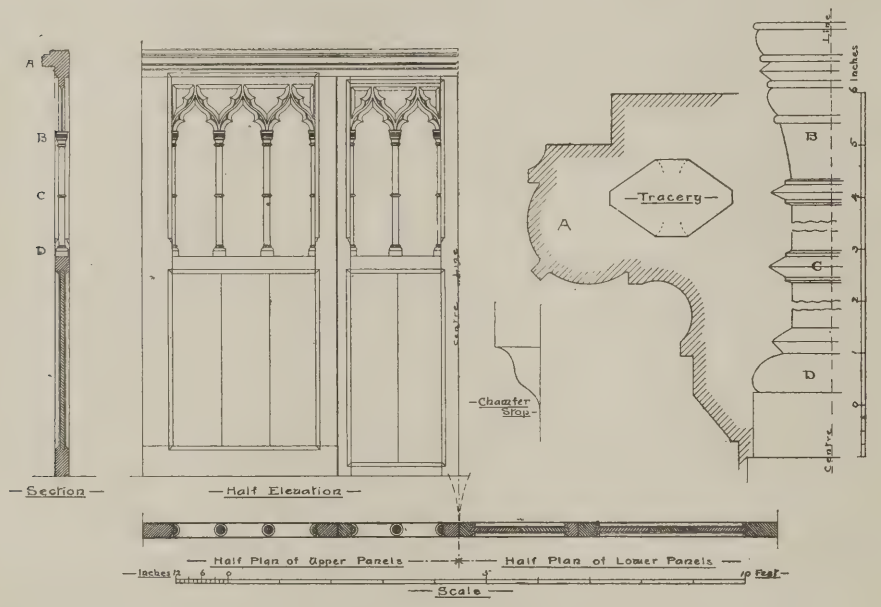
Distemper.—22,081. R. Cussen, 58, Lough Road, Cork. Two gallons of water are added to 2lbs. of glue, and boiled. When cool the following ingredients are added separately:—Paper varnish, 2 pints; boiled linseed oil, 4 pints; turpentine, 2 pints; terebine, 1 pint. The mixture is then boiled and afterwards strained. It is claimed that this distemper will not emit any offensive smell, no matter how long it is kept.

The following specifications were published on Thursday last, and are open to opposition until October 7th next. The name in italics is that of communicator of invention. A summary of the more important of them will be given next week.

1901.—8,706, Macculloch & Dickinson, cash registering tills. 15,554, Harrisson, artificial stone. 15,621, Thame, waterproof composition for floor coverings, wall decorations, &c. 16,600, Malkin, Binns & Foster, guards for wood-planing machines. 16,702, Smith, acetylene-gas generators. 17,540, Dyson, red aggregates for the manufacture of artificial stones, pavings, &c. 17,915, Adams, gulleys. 17,917, Adams, drainage channels. 18,240, Ritter & Rowland, lock-hinges. 18,366, Newton, apparatus for sewage treatment. 18,405, Peake, sewage purification. 18,557, Barnes, clamping devices. 19,273, Whitelaw, guards for circular saws. 19,295, Mousley, footballs. 19,296, Bond & Strickland, sliding windows, shutters, &c. 19,352, Borrington, water-closets. 19,536, Harper, tap for water-supply pipes. 19,666, Zastrow, drying-rooms and trucks for bricks. 19,803, Chance, glass-facing tiles, slabs, &c. 20,529, Smith, connecting-piece for drainage and other pipes. 23,603, Scholefield, glazing roofs and structures. 24,233, Conner, fastening for windows, doors, &c.

1902.—3,802, Baxter, apparatus for screening stone, &c. 4,013, Bousfield (*Fresh Air and Safety Sash Fastener Co., Ltd.*), sash fasteners. 5,874, Morton, apparatus for

drying lumber. 8,552 FAULKNER & FAULKNER, radiators, towel rails, &c. 9,920, ADAMS, filters for sewage. 10,571, ROACH, automatic distributing apparatus for sewage. 11,978, CHAQUETTE, making trenches for laying sewer pipes. 13,099, SMITH & MOLDEN, flushing cisterns. 13,118, GRÜNHÜT, dyeing timber. 13,331, GOUCHER, sash-locks. 14,396, JAUBERT, brick. 14,403, BURN & BURN, water waste-preventers for flushing purposes.



Masters and Men.

Mines and Quarries.—The general report and statistics relating to persons employed and accidents at mines and quarries in the United Kingdom, and to the enforcement of the Mines and Quarries Acts, has been issued by the Home Office as a Blue-book. The total number of persons employed at mines and quarries in the United Kingdom and the Isle of Man during 1901 was 933,366, of whom 839,178 were employed in or about mines and 94,188 in or about quarries. Of the 839,178 persons employed at mines 666,626 worked underground and 172,552 above ground; of the last-mentioned 5,588 were women. Compared with the preceding year, there is an increase of 22,384 males working underground, and an increase of 1,912 males and of 365 females working above ground, making a total increase of 24,661 persons. The increase occurred entirely at coal mines. Of the 94,188 persons employed in and about quarries, 59,968, including four females, worked inside the actual pits, holes or excavations, while 34,220, including 39 females, were employed at factories and workshops outside. Compared with 1900 the number of persons employed inside quarries shows a decrease of 673, and the number outside quarries an increase of 956 persons. In 1901 1,075 separate fatal accidents occurred in and about the mines and quarries of the United Kingdom, causing the loss of 1,229 lives. Of these 98 were lost at quarries.

The Ruins in Mashonaland.—Further discoveries have been made in the great ruins at Zimbabwe. Two ancient ascents leading up to the citadel have been found, and the citadel itself has been cleared. An old stairway was also discovered, and various objects, including gold bangles and pieces of pottery, were found. One of the passages, which was penetrated for the first time, is 994ft. in length.

SWANSCOMBE CHURCH.

ON page 13 of last week's issue we gave particulars of the disastrous fire that occurred at Swanscombe Parish Church caused by its being struck by lightning. We give on this page a measured drawing of the screen under the tower arch which was destroyed. This is said to have been part of a rood screen, and there was certainly one, as the wall of the south aisle also shows the steps leading to a rood loft. The rare Norman font, formed out of a block of solid chalk and carved with the emblems of the four Evangelists, has been shattered. But this, it is hoped, may be fitted together again, as the fragments have been carefully preserved, and the most valuable piece of carving is still intact. The work of restoration has been entrusted to the architect who restored the church in 1874, Mr. Jabez Bignell, a pupil of Sir Gilbert Scott, who spoke of the restoration as "a most careful and successful piece of work." According to his report sent in last week, the chief work to be done is a new nave roof, most of the north and south aisle roofs, new wood spire and floor to the tower, also the reseating of the nave and aisles, with repairs to the stonework and fabric generally, and possibly the rebuilding of the upper portion of the tower, in addition to a set of new bells. The latter is perhaps the saddest loss of all to the neighbourhood, The six bells of Swanscombe were famous throughout Kent, three of which were cast in 1751. The cost of restoring the building to its original appearance, including new bells, he estimates at about £4,000. The church was insured in the Ecclesiastical Insurance Office for £2,550, including chancel and organ, which have suffered to a comparatively slight extent. The lightning-conductor had been examined, as it happened, a few days before the disaster in the course of some repairs by the churchwardens, and appeared to be free from any defect. But the lightning appears to have struck the wooden-shingled spire, and the whole structure was observed to be blazing furiously a few moments afterwards. Every effort was made by the local fire brigade, who were on the spot almost immediately. But the men were handicapped by the low pressure of the water obtained from the Kent Waterworks hydrant, which made it impossible to send a jet as high as to reach the top of the tower. The church plate, including a chalice of 1620, is safe. The rector makes an appeal for subscriptions for the restoration.

TOWER SCREEN, SWANSCOMBE CHURCH, KENT. MEASURED AND DRAWN BY FRANK J. WALLER.

Keystones.

Lancaster Parish Church.—The Vicar of Lancaster, Rev. Canon Bonsey, in reference to the memorial chapel to fallen soldiers of the King's Own Royal Lancaster Regiment, proposed to be erected in the Parish Church, says that in the opinion of the eminent architects, Messrs. Austin & Paley, the chapel would not have the effect of destroying the proportions of the church, but that an additional north aisle in the nave, with arches where the north wall now stands, would greatly improve the appearance of the church and add to its dignity. A memorial chapel at Bowerham is out of the question on account of the cost.

A Botticelli at Berne.—The Berne Museum has just come into possession of an important picture, left to it in 1881 by the painter Von Stürler, who died at Versailles. It professes to be the "original" of the famous "Magnificat" by Botticelli, one of the glories of the Uffizi. It is somewhat smaller than that picture, and has at one time been cut in two and rejoined. Von Stürler acquired it at Florence many years ago. The Berne authorities claim that this new picture is by Botticelli himself, and an earlier version of the Uffizi *tondo*; but as to this not very probable hypothesis it is safer to reserve one's opinion till the real authorities have spoken.

The Parish Church of Aldenham was struck by lightning last week. The spire was practically destroyed. The clock wire appears to have acted as a conductor, and a ball of fire which shattered the case around the wire produced three terrific explosions. Three persons standing under the belfry were all knocked down and rendered unconscious for some minutes, but beyond a temporary paralysis of the limbs they suffered no harm. The lightning set fire to some cleaning rags, and the church was filled with smoke, but the flames were soon extinguished. Two servants at the vicarage were also knocked down by the force of the explosion. Tiles from the spire were picked up 60yds. away.

The Theatre Royal, Exeter, which has been closed for several weeks, was reopened recently after undergoing considerable improvements in the interior. The frontage of the circle has been brought about 12ft. 9in. nearer the stage. The whole flooring has been raised 3ft., and the old wooden partition at the rear supplanted by a permanent stone corridor, on the top of which rest nine private boxes. The flooring immediately behind the orchestra has been raised, and the partition which formerly divided the pit stalls and orchestra stalls has been moved back to the old boundary of the pit. Messrs. Dart & Pollard are the contractors for the alterations, Mr. Charles Cole, of Exeter, being the superintendent architect. The decorations have been done by Mr. J. Algar, of Exeter, under the superintendence of Mr. Montgomerie Neilson.

A New Organ at Tawstock Church has been erected at a cost of £480 at the west end of the church, and owing to the necessity for dividing it, in order not to obstruct the beautiful stained-glass window representing "The Ascension," the instrument had to be built differently to most organs. The tubular pneumatic system with compressed air, from the same bellows as supplies the sounding portion of the instrument, as the motive power, has been adopted. Messrs. F. H. Browne & Sons, Ltd., of Deal, Kent, are the builders. The oak casing for the organ is not yet completed, but is to be in position at the end of this month. Messrs. Shapland & Petter, of Barnstaple, have this portion of the work in hand. The old oak seats, which had to be removed to make room for the organ, have been placed in the north transept of the church.

A Fire Station and Workmen's Dwellings at Bangor.—The Local Government Board have sanctioned the borrowing of £405 for providing a fire station and £7,445 for purchase of workmen's dwellings.

An Exhibition at Portland (Oregon) will be held in 1905 to commemorate the centennial of the expedition of Lewis and Clark. It will be on a large scale, and a guarantee company has been incorporated, with a capital of £100,000, under the name of "the Lewis and Clark Centennial and Pacific Exposition." Subventions are expected from the State of Oregon, the neighbouring States and the Federal Government.

A New Constitutional Club at Hinckley has been erected from plans by Mr. W. T. Orton, of Hinckley and Birmingham. The club is on the Station Road, and is built of brick with Hollington-stone dressings. The main entrance is from Station Road, and on the ground floor are the reading-room and the committee and two smaller rooms. The remainder of the ground floor is occupied by three lock-up shops. On the first floor are the billiard-room, a smoking-room with refreshment bar, and two apartments to be used as card-rooms. In the rear are the manager's quarters.

A Catholic Day School, at Whitwick, is being erected on Parson Wood Hill, to accommodate 500 children. The cost is estimated at about £5,000. The buildings are designed on the central hall plan, and consist of a hall 71ft. by 33ft., with nine classrooms, four on each side of the hall and one at the end. All the classrooms are lighted from windows to the left-hand of the scholars, and separated from the central hall by movable glazed screens, all being under the direct superveillance of the headmaster or mistress. Separate entrances and cloak-rooms are provided for boys, girls and infants, and private rooms and store closets are set apart for the head teachers. The walls, both internally and externally, will be faced with red bricks of local manufacture. The dressings externally are of red terra-cotta and Ancaster stone. All roofs will be covered with green slates, and all ceilings plastered. The whole of the work is being carried out by Mr. Walter Moss, builder, of Coalville, Messrs. McCarthy & Co., of Coalville, are the architects.

The New Church of Ethelwold's, Shotton-in-Hawarden, has just been consecrated. The erection of the church was begun 3½ years ago. The cost has been about £7,000. It is built of Staffordshire sandstone, with a clearstory, western gallery, and an apse capable of holding 600 persons. There are three sets of windows in the east end. In the gallery are three stained windows. The gallery is approached by a flight of steps from the porch, this being a new feature in church design. The floors of nave, aisles and choir are laid with wood blocks, the chancel with small black and dove-coloured tiles. The step and floor in the sacrarium under the altar table is in marble. All the painted glass is by Mr. Edward Frampton, of London. The pulpit and font are carried out in stone, the former having open arcading and carved pateræ, the latter being in Helsby stone. The nave and aisles are seated throughout with chairs, the chancel having oak choir fronts and prayer desks. The altar table is of oak, and has been carved by Mr. Frank Hurlbutt. The reredos above is of wood, carved, painted and decorated. The church is lighted throughout by suspended oil lamps by Messrs. Singers, of Frome. Messrs. J. King & Co., Liverpool, are responsible for the heating. The whole of the structural work has been carried out by Messrs. J. Ward & Son, of Uttoxeter, from the design of Messrs. Douglas & Minshull, of Chester.

A Carnegie Library Competition.—A limited competition for the Carnegie Library at Coatbridge has just been decided. Mr. T. L. Watson, architect, Glasgow, was selected as assessor, and advised the committee and the town council throughout. On his recommendation the plans of Mr. Alexander Cullen, Motherwell, were adopted from among ten sets submitted and premiums were awarded to Messrs. A. N. Paterson, Glasgow; George Arthur & Sons, Airdrie; and Alexander MacGibbon, Glasgow. One competitor was disqualified, his design being much in excess of the limit of £10,000.

A New Branch Co-operative Stores at Rosehill, Willington Quay has been erected for the Willington Quay and Howdon Industrial Society, Ltd. The building forms a section of a scheme which, when completed, will cover an area of 126ft. by 70ft., and consists of grocery and provision, green grocery and butchering departments. Externally, the building is constructed with Accrington red-pressed bricks, relieved with moulded stone cornices, architraves and other dressings. Messrs. W. A. Fishburn & Co. were the contractors, Mr. J. W. Hanson was the architect, and Mr. J. Thompson the clerk of works. The cost of the building is £2,464 10s.

Mr. George Truefitt architect, of Manchester, died recently at the age of seventy-eight years. He designed banks at Altrincham, Blackburn and Manchester. He built a little church at Davyhulme, near Flixton. Chorlton-cum-Hardy Church, a turret, some tracery in the windows, and a lych-gate are from his designs. Besides the banks, he carried out much work in Aberdeenshire for the late Sir W. Cunliffe Brooks, and also for the baronet's son-in-law, the Marquess of Huntly. A very simple little church of his was built for the Irvingites near the Angel at Islington. He had a large practice in houses great and small, in churches with their accessories, in banks, and other buildings.

St. John the Baptist's, Little Marlow, is now being restored. The edifice, which was originally erected in the Norman and Early English styles of architecture in the year 1190, was last restored in 1866, since which time the stone battlements and buttresses of the old tower—the finest example of Norman work existing in Buckinghamshire—have given evidence of the want of urgent renewal; in fact, being pieced with friable and broken stucco, it has not only become unsightly, but, by the breaking away of fragments, smaller or larger, perilous to passers-by. The repair of the fifteenth-century window mullions, sills and the roof are also receiving attention. In addition important improvements connected with the chancel, the Ledewich chantry and the organ have been undertaken.

The Restoration of Diseworth Parish Church has been completed after being in hand for about eight years. The chancel has been restored and a new east window and two south windows placed therein. The old plaster has been removed from the walls, a new tiled floor laid down, oak pews installed, and the whole of this part of the building fitted with new lamps. The south aisle was restored as a memorial to the late vicar. Considerable attention has been given to the restoration of the tower; the walls of the nave have also necessitated a large expense on their renovation; the pews throughout have been cleaned and stained, and the whole building fitted with large standard lamps. The restoration of the lectern, one pillar, and the re-tiling of the vestry floor was the work of the late vicar's own hands. Two stained glass windows have been placed in the west front of the church and a new fifth bell hung in the tower. A set of new gates adorns the entrance to the church.

Coming Events.

Saturday, August 30.
ARCHITECTURAL ASSOCIATION.—Fifth Summer Visit to Heathfield Park.
NORTHERN ARCHITECTURAL ASSOCIATION.—Students' Sketching Club Excursion.
TRADE UNION CONGRESS.—Conference on Housing and Cheap Transit, Toynbee Hall, 4.30 p.m.

Wednesday, Sept. 3.
IRON AND STEEL INSTITUTE.—Meeting at Düsseldorf. First Day. Reception in Tonhalle. Visits to Exhibition and Conversazione.

Thursday Sept. 4.
IRON AND STEEL INSTITUTE.—Meeting at Düsseldorf. Second Day. General Meeting at 10 a.m. in Tonhalle to hear Papers read. Visit to Exhibition at 3 p.m., and Banquet at 7 p.m.

Friday Sept. 5.
IRON AND STEEL INSTITUTE.—Third Day. Visits to Works.

Saturday Sept. 6.
IRON AND STEEL INSTITUTE.—Fourth Day. Visits.

Tube Railways. The September number of "The Chamber of Commerce Journal" contains an interesting, if not very far-reaching, article on Tube Railways from the pen of Mr. Reginald E. Middleton, M.I.C.E. The author appears either to have been cramped for space or somewhat appalled by the possibilities of his subject, for he is a long time in coming to grips with the pros and cons, but at the same time he has avoided needless technicalities and discussed his theme in a manner that will appeal to the average business man. The advent of the tube railway is an interesting subject; but we think Mr. Middleton has not grasped the main reason for their appearance and success. This may be summed up in the word *speed*. The constant acquisition of residential property for shops and office buildings has driven the residential quarters of London further and further out. Rents and rates have increased, and the average middle-class business man is forced to live further away from his business. He is luxurious in his habits; and requires more time for social intercourse, for boating, tennis, theatres or other recreations. It naturally follows that he requires a form of traction that will enable him to accomplish his journeyings quickly and at small cost. Omnibuses are necessarily slow, and the majority of the railway companies have never attempted to meet the demand for quick transit. A journey from the City to Hammersmith by the Metropolitan line takes fifty minutes irrespective of the time wasted in waiting for the right train. To get from Fulham to the City is an hour's journey from door to door. The Tube railway, with its quick, cheap and frequent service, has naturally been a success and will continue to be so. Mr. Middleton rightly deprecates the haphazard method in which the new tube lines are being projected and the want of system in laying out their courses. He also draws attention to the fact that they are hardly likely to reduce the street congestion, as they carry little or no luggage and no merchandise, and therefore do not affect the number of carriers' and other carts engaged in such work. This argument is constantly advanced in connection with the question of street-traffic, and is quite pointless. It seems to us quite immaterial whether goods are brought in carts from one of the main-line goods stations or from a tube merchandise station. Either way the cart has to be employed. In the one case the goods are carted perhaps two miles; in the other perhaps 200 yards. The cost of transferring the goods or the truck from the trunk line to the tube would probably make the tube carriage more costly, and it would be exceedingly difficult and expensive to construct the large sidings underground necessary to hold the trucks while they were being unloaded. In fact, all the arguments advanced with reference to street congestion only confirm our statement that the use of the tube railway is quick passenger transit. The tube railway promoter knows his fare, and we may be quite sure that he has reckoned with all the possibilities of the system.

An Entrance. The accompanying illustration shows the new entrance to Messrs. Vickers, Sons & Maxim's offices at their Naval Construction Works, Barrow-in-Furness. The new doorway, at present being inserted in the existing stone front to Ferry Road, is in red sandstone from St. Bees. On the inside a new entrance hall is formed with waiting-rooms, &c., on one side, the vestibule screen being in teak and leaded lights. The walls of the hall are panelled in teak 8ft. 6in. high, with a frieze above 3ft. 6in. deep, to be in Tynecastle canvas in relief, with teak cornice above. Mr. George Varley, of Barrow-in-Furness, has the contract for the stonework; the joinery work and parquetry floors to be prepared at the shipyard by the company's own joiners. The whole is to be worked from details prepared by the architect, Mr. W. Moss Settle, A.R.I.B.A., of Barrow-in-Furness.

W. MOSS SETTLE, A.R.I.B.A., ARCHITECT.

KRONBORG CASTLE, ELSINORE.

COPENHAGEN AND ITS SURROUNDINGS.

By G. R. BRYCE.

(*Concluded from p. 22, No. 394.*)

THE walls of Christiansborg Palace are still standing, and give an idea of its former splendour. It is said that the smell of burning was noticed about a fortnight before the flames burst forth, and that the fire lasted six weeks. The work of restoration will begin when sufficient funds are available, but as this seems an insurmountable difficulty the palace will probably remain as it is for many years yet.

Another building of which King Christian IV. was the founder and architect is the castle of Rosenborg. It was finished about the year 1625, and was a royal residence till the beginning of last century. Since shortly after its completion it has been used as a storehouse for art treasures, &c., and as the collection has grown with advancing years it now forms a chronological museum of the Danish kings. A visit to Rosenborg is one of the most interesting in Denmark. The collection is specially well arranged in the very rooms in which the royal owners of the different objects lived, and in passing through the castle one can form a good idea of the culture and history of Denmark during the last few centuries. The building itself, like the Exchange, is in the Dutch Renaissance style; and although some of the rooms have been preserved in their original state, others have been re-decorated in the Rococo style. The coronation chairs of the king and queen are to be seen here, and also three silver lions representing the Sound, the Great Belt and the Little Belt, which are used only at coronations, royal funerals and such ceremonies. These are in the Knights' Hall, which occupies the whole of the second floor of the building. The magnificient tapestries in this hall are by Bernt van der Eichen and date from the end of the seventeenth century. They depict various battle events. It is impossible to give in a few words any idea of the different objects to be seen in this collection. Royal robes, furniture, portraits, jewellery and carvings are among the treasures, and there are rooms containing collections of precious Venetian glass and different kinds of china from all parts of the world. The grounds of Rosenborg, generally called the King's Garden, form one of the fine public parks of Copenhagen. Some of the old trees are magnificent, and among the statues is one of Hans Andersen, of fairy-tale fame. He is represented sitting with one hand outstretched, as if relating an exciting part in one of his inimitable tales.

There is no definite record of Inigo Jones's work in Denmark, the probability being that no building in that country can be attributed entirely to him; but it appears that the royal architect of Fredericksborg acquired his services during the first quarter of the seventeenth-century, and therefore we may reasonably assume that the splendour of Rosenborg is due a good deal to his influence, and that he assisted King Christian IV. with the Exchange also.

Crossing the bridge which spans the strait separating the islands of Zealand and Amager, we reach the old suburb of Christianshavn, and a few minutes' walk brings us to Vor Frelsers Kirke (Church of our Saviour), which boasts a remarkable if not particularly elegant spire. Round the outside twists a stairway; the walls of the spire, instead of tapering, being perpendicular, and receding towards the centre as the stair ascends. The spire finishes with a huge gilt ball, on which stands a figure of Christ.

Reference to the illustrations of Røskilde will give the reader an idea of the most important of the cathedrals to be seen in Denmark. Half an hour's run by train from Copenhagen brings us to the old village, at one time the capital of Denmark, beautifully situated at the head of the fjord to which it gives its name. As early as the tenth century King Harald Blaatand erected a cathedral here, but, being of wood, it gave place to a more substantial edifice about the middle of the eleventh century. The present cathedral, dating from early in the thirteenth century, has been several times damaged by fire, but has always been restored. The early use of

KRONBORG CASTLE. ELSINORE.

the pointed arch, as well as some details of plan, are ascribed to French influence, and the cathedral is said to bear a resemblance to that of Tournai in Belgium. Rœskilde Cathedral has been the Danish royal burial-place for many generations, and anyone not objecting to a rather gruesome ten minutes may wander in and out among the coffins in the side chapels. Some of them of copper with embossed figures are worth seeing, but others merely covered with black velvet are decidedly shabby. In the triforium on the north side of the nave is the royal pew, dating from the beginning of the seventeenth century. It is richly carved and coloured, the figures representing Faith, Hope, Justice, &c. The forty-four choir stalls are ornamented by a series of carvings forming a frieze along the top. Like many of the mediæval carvings in our own churches, these crude figures are employed to illustrate Bible events with generally more accuracy than elegance or even delicacy. The panels depict such scenes as Adam and Eve in the Garden of Eden, Noah's Ark, Job and his friends, &c. In the last, Job is sitting in a chair, and the disease from which he suffered is represented by innumerable lumps all over the body. The comforters hover in the background. In one of the burial chapels are two magnificent wall paintings by Marstrand, each measuring about 7yds. square. One shows Christian IV. judging a nobleman, the other the same king at the battle of Femern, where, with bound-up wounds, he is exhorting his men to persevere, exclaiming "God is with us." The Danish national song, "King Christian stood by the lofty mast," is founded upon this incident. On the centre column supporting the vault in the chapel of King Christian I. are inscribed the heights of a number of royal persons, among them being Peter the Great, 79in., and Christian IX. (the present King of Denmark), 71in. At the west end of the cathedral there is an old dial with a kind of projecting platform above. On this platform are some wooden figures dating from about 1500—a man who, provided with a hammer, strikes the hours on a bell, and a woman who similarly records the quarter and half hours on a smaller bell. St. George, too, mounted on a grey horse, is seen encountering the dragon. Before the stroke of the hour the horse tramples upon the dragon, which forthwith utters a piercing shriek.

Few visitors leave Denmark without going to see Kronborg Castle. A terrace separating the castle from the sea-beach is the "platform before the castle of Elsinore" spoken of in "Hamlet." His grave is pointed out in a wood at Marienlyst, less than a mile distant. Krônborg was built first in 1574, but after a fire was restored by the architect-king Christian IV. in 1635. The courtyard, illustrated on this page, dates from the latter year. Beyond a visit to the chapel, and the ascent of the tower, there is not much to interest the visitor, as the castle is chiefly used as barracks.

The reader will have received from the foregoing notes an idea of a few of the objects of interest in and near Copenhagen, but the list is by no means an exhaustive one. For those who can make a lengthy sojourn in the country there is plenty to occupy the time. The old cathedrals of Ribe and Aarhus and the ruins of Koldinghus, &c., will repay a visit, while many days can be profitably spent in studying the museums and art galleries in Copenhagen itself. There are a number besides those already referred to—the National Art Gallery, containing many valuable pictures by Danish and other artists, the National Museum, the "Danske Folkemuseum," &c. Fredensborg, the king's autumnal residence, has not much attraction for the tourist, except its park, which is said to be the finest in Denmark. The Royal Shooting Box (of which an illustration was given last week) is situated in an open part of the deer forest (dejrehaven) near Copenhagen. It was built in 1736 by the architect De Thurah, but is only occasionally used now. The Danish "Derby" takes place on the racecourse near "The Hermitage." The china manufactured at the Royal Porcelain Factory is in many respects unique, the colouring and design of the different articles being out of the common. The clay for this particular china is procured at the island of Bornholm, in the Baltic. Living in Denmark is moderate, and the various places of interest are within easy reach of the capital by means of the government railways and the excellent steamers of the United Steamship Company.

THE COURTYARD, KRONBORG CASTLE.

PANEL, KRONBORG CASTLE.

COSMATI MOSAIC.

By CARYL COLEMAN.

THE arts and crafts, like everything else in this world, have their periods of growth and decay, seldom, however, reaching complete extinction, as each decadence, sooner or later, is followed by a new birth.

In no one of the arts and crafts is this fluctuation between life and death more marked than in that of the mosaicist. At first the art was employed almost exclusively in the making of floors, attaining in the course of time a high state of excellence, until mosaic pavements became universal throughout the Roman world of the early Empire. Very little in the way of wall mosaic was attempted before the reign of Claudius, and no work of importance was executed up to the time that Constantinople was made the seat of government. Then it was that Christianity, a new force in the world, called forth picture mosaics of great artistic merit.

The fall of the Roman Empire was fatal to the art in the West. For a time it ceased to exist. Then it was resuscitated by artists from the Orient. Hence, at the beginning the revival was largely governed in its expression by Byzantine methods of work and iconographic traditions, but later it developed along paths of its own, striking out for new roads of application and growth. In the East the art ultimately became circumscribed in its endeavour by a sterile and fixed

ROSKILDE CATHEDRAL.

conventionality, and because of its inflexible adherence to this conventionalism, together with the Mohammedan subjugation, it died of inanition.

The mosaics of Europe of the fourth, fifth, sixth and seventh centuries are noted for their great beauty and magnificence. There is a scarcely perceptible deterioration observable at the end of the period, but in the eighth and ninth centuries they are marked by a decided Byzantine feeling, imparted to them by the presence in Italy of a large number of Greek mosaicists, who had taken refuge there from the persecutions of the iconoclasts. During the tenth century there was an almost total cessation of the art. It revived again in the eleventh. Fairly good work was done in the twelfth, and much better in the thirteenth. Then it was that mosaic began to be used very widely as a purely architectural decorative material. In the fourteenth and fifteenth centuries the mosaicists returned almost exclusively to pictorial decorative work, while in the sixteenth and seventeenth centuries they became mere imitators of paintings in oil, and so dexterously are their mosaics made that they are continually mistaken by laymen for the original pictures of which they are copies. In the eighteenth century the art hardly existed. In the nineteenth it was called once again to life; and now in the twentieth century its value is fully recognized.

Apparently the artist in mosaic has a great future, because durable materials are being employed more and more, and mosaic is the only lasting substance possessing a large colour field, and at the same time adaptability for permanent polychromatic architectural enrichment.

As the use of mosaic is confined almost exclusively to decorative purposes rather than pictorial, it would seem well to study the works of the Cosmati, the great masters of this branch of the art: an Italian family of artists and craftsmen who, from father to son, for several generations practised their art with wonderful success. The family originally came from Anagni, a small hill-town thirty-seven miles E.S.E. from Rome, migrating to the capital at the end of the twelfth century, where they remained for over a hundred years, until the "Babylonish Captivity," as the Italians are pleased to call the removal of the papacy to Avignon. The Christian names of the most important members of the family are well known, but their surname is unknown. Just why historians and archæologists have agreed to designate them as the Cosmati is hard to say, although there is no doubt the name was derived from that of one of their number, Cosmatus. The time of their coming to Rome was at a period most favourable for their art, as it was a great building age. Cardinal Lothario Conti, like the Cosmati, a native of Anagni, had just been unanimously proclaimed Supreme Pontiff and saluted, because of his blameness life, by the name of Innocent. He was a man of force, an organiser and a masterful leader, who not only raised the papal power to its utmost height, but also infused Christendom with a spirit of creative activity which materially promoted the arts and crafts and opened a field for the employment of artistic genius of every kind.

The founder of the cosmatesque school of mosaic workers was one Laurentius, who on coming to Rome was at once admitted to citizenship, and made, in 1198, a member of the marble workers' guild, an organisation dating from 1150, which largely "accomplished its work at the expense of the ruins of Ancient Rome."

Laurentius, no doubt, acquired his art from Greek masters or their pupils, and for a time followed their method of work—although this could not have been for long, as it is fully proven that at an early stage in his career he showed an independence of thought and feeling that freed him from the trammels of tradition and Byzantine influence, and caused him to work from original motives. Applying, with wonderful artistic discretion, all the decorative resources of his art, he produced a style pervaded by a vigorous colour scheme in union with a strong design (far more so than the delicate ornamental mosaic of the Venetian school), a style refined, although touched perceptibly by the Western barbaric spirit, yet quite free from the rudeness of the Roman and the hardness of execution of the then Byzantine schools. He never considered mosaic by itself a thing apart from its surroundings, but always in conjunction with plain or sculptured marble surfaces: a decorative accessory to some architectural feature. So strongly was this use of mosaic fixed in his mind, that he invariably made his pavements, in design similar to those of the Byzantines, of slabs of marble cut to a given form and bordered with a fantasy of tessellated mosaic enrichment, a sort of combination of *Opus Alexandrinum* and *Opus Sectile* of the ancient Romans.

Laurentius, as a rule, employed white or light-coloured marble for his backgrounds, and these backgrounds, or fields, he inlaid with squares, parallelograms and circles of coloured marble and porphyry, surrounding them with ribbons of mosaic and separating them one from another with marble mouldings, carvings and plain bands, and further enriching these members with mosaic. The mosaic itself was composed of small tesseræ of antique glass, mixed with those made at that time. The first were found in great abundance in the ruins of Rome and other ancient cities, while the latter were easily obtainable, as the art of making coloured glass was then widely practised throughout the Christian world. The designs followed were purely geometrical: a beautiful development of a star motive, most ingeniously diversified not so much by change of form as by variation of colour.

Whatever work Laurentius may have executed previous to his becoming a Roman citizen has either been destroyed or can no longer be identified. That he worked in the church at Fabieri in 1190 is known, but nothing of the work itself is known. The first authentic examples of his subsequent work are in the church of the Ara Cœli at Rome: the epistle and gospel ambo, a choir-screen no longer in place but behind the high altar, and a pavement extending over the nave, aisles and transepts. This work, however, was not wholly his, as his son Jacobus was associated with him. This Jacobus, a most apt son of a most

skilled father, was not only a sculptor and mosaicist, but also an architect, a fact made known by inscriptions on the walls of the cathedral of Civita-Castellana. Jacobus took charge of the architectural alteration of this interesting building, while his father, and later his son, Cosmatus, assisted him with the decorations, sculpture, carvings and mosaics.

The cathedral was originally a basilica, but during the course of the centuries it was very much changed by additions and decorations, and lost its primitive simplicity; yet it is even now one of the most interesting ecclesiastical edifices in Italy, made so largely through the art of the Cosmati.

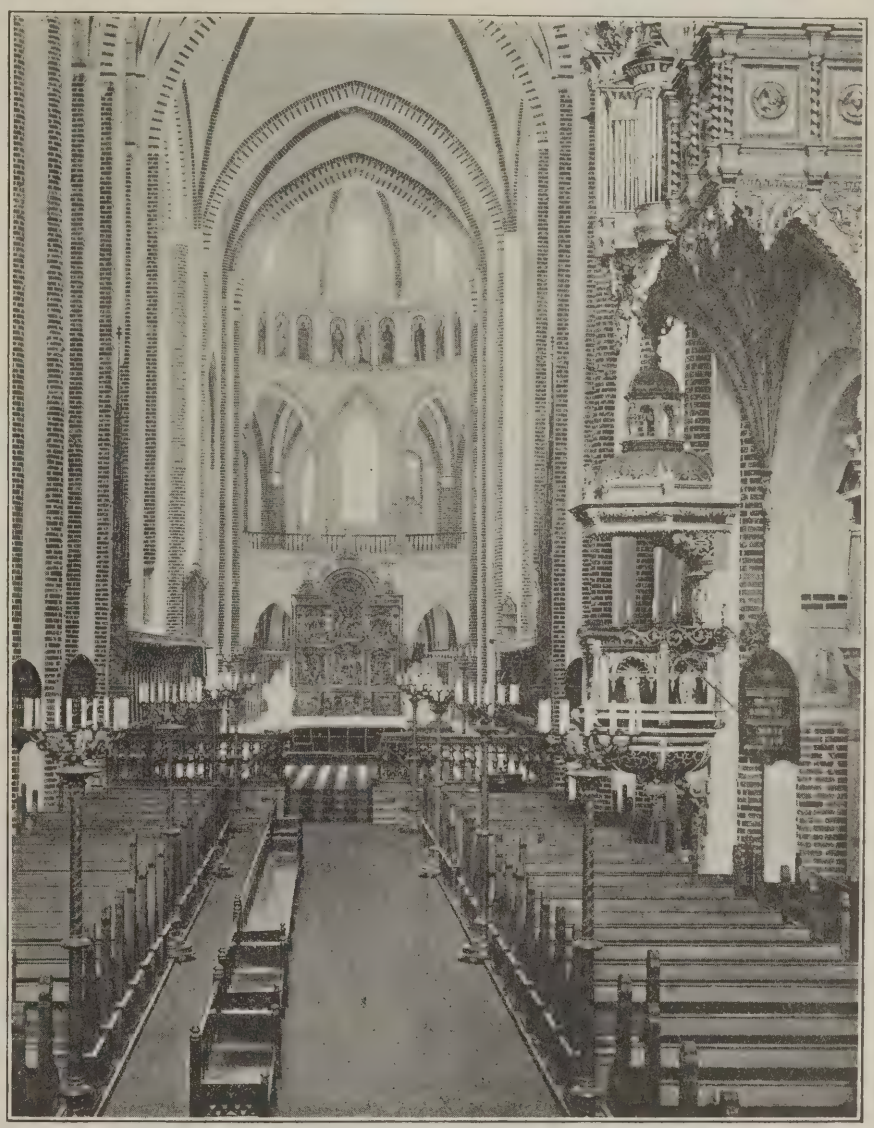
Similar work to this may be seen and studied in many churches in different parts of Italy: Toscanella, Corneto, Subiaco, Anagni, Viterbo and Salerno, but notably at Rome, where the Cosmati and their followers not only supplied the churches of the city with ambos, altars, paschal-candlesticks, thrones and screens, but also distant places as far away as this country: witness the shrine of St. Edward the Confessor in Westminster Abbey, which is unquestionably Cosmatesque work.

The brothers Deodatus and Johannus, the last of the Cosmati of whom anything is known, were pursuing their art at the end of the thirteenth and the beginning of the fourteenth centuries with the same enthusiasm displayed by their great-grandfather in the twelfth century. Deodatus built in 1296 over the high altar of St. Maria in Cosmedin, at Rome, a very beautiful marble and mosaic ciborium; and his brother, three years later, designed and executed in St. Maria Maggiore one of the most "elegant mediæval tombs in existence," that of Gonsalvus Rodrigo, bishop of Albano, and later, in 1304 in the church of St. Maria Sopra Minerva the tomb of William Durandus.

It is doubtful if the Cosmati have ever been excelled as decorative artists in mosaic, or been surpassed in their knowledge of the possibilities and limitations of mosaic as a decorative material; therefore, their works should be studied most carefully by all who are now attempting to use ornamental mosaic in a decorative way. Much can be gleaned from photographs about the forms they employed, and the proportional distribution of the mosaics to the conjoining plain and carved accompaniments, but their colour schemes can only be understood by examining the monuments themselves.

Some students, because of a seeming resemblance between the Cosmatesque mosaics and those of Monreale and the Cappella Palatina at Palermo, are inclined to deny originality to the Cosmati, and claim that their work was only a dexterous imitation of Silician and Oriental models, but this seeming similarity is only apparent when the mosaics are examined and compared superficially, for, in truth, the mosaics of the Cosmati are largely inlays, where the marble has been countersunk to receive the mosaic, accompanied with carvings, while the others are nothing more than ornamental dividing lines between plain sufaces, and often following in design floral and other naturalistic motives.

University College, Liverpool, and the R.I.B.A.—The following probationers having passed the examination recently held at University College, Liverpool, and received the Final Leaving Certificate granted by Prof. F. M. Simpson, and their Testimonies of Study having satisfied the Board of Examiners, they have been registered as Students R.I.B.A.:—J. L. S. Dahl (Hull), P. Dawson (Liverpool) and B. Oliver (Sudbury). The Institute is to be represented at the Liverpool University College Examination by a member of the Board of Examiners.



THE PUBLIC HEALTH CONGRESS.

THE Congress of the Royal Institute of Public Health was continued at Exeter on Monday of last week, when the section devoted to Municipal and Parliamentary Hygiene met for the first time, the Mayor of Plymouth, Mr. J. A. Bellamy, presiding.

In his opening address the President said that there was an ever-increasing desire to make life in our towns more healthful for the poor as well as for the rich. The problem ever present, however, was, in the first place, the education of public opinion, and, in the second, that of cost. The question was, What could be done by means of the machinery provided by municipalities or by Parliament to make days better than they were for those who lived in towns and cities? Abundance of pure air and water, a perfect drainage system and personal cleanliness would practically solve the problem. The starting-point of a municipality desirous of doing its duty in this respect should be the appointment of a medical officer whose whole time should be devoted to the duties of his office. By reason of the varying conditions in some towns compared with others, the lack of courage on the part of the Local Government Board, and the impracticable conditions imposed by that Department, very little progress had been so far made in providing the poor with dwellings where they could get plenty of pure air to breathe. The terms for the repayment of loans should be extended, and municipalities should be allowed to erect such dwellings as they pleased and as they might think best suited to local requirements. In conclusion, he urged the importance of public baths, muscular training for the young, and the adoption of methods to prevent the depopulation of country districts.

Housing the Working Classes.

In a paper on "The Housing of the Working Classes" Mr. J. W. Spear, M.P., said that private enterprise and philanthrophic methods might do something, but could not, unaided, do more than touch the fringe of the question. The State had a duty before it. While good work had been done by municipalities and local governing bodies through the extended power to erect buildings and assist the occupiers of small houses, failure to cope with the real evil was very marked, which might be partly due to natural causes and partly to the artificial conditions with which the powers of the local bodies were hedged and hampered. Owing to the cost attendant upon erecting workmen's dwellings in towns, he suggested that municipalities should purchase land in the country for the purpose, and as this would necessitate much more regular, constant and rapid transit from the centre to the outskirts, he urged that when municipalities were engaged in street improvements they should

ROSKILDE CATHEDRAL.

work with a view also to opening up of definite and easy modes of ingress to and egress from the town. In clearing and renewing houses, the very poorest men and women in casual work and those unable to pay the cost of journeying to the suburbs were rendered homeless. This resulted in greater overcrowding still in another area, and it was surely this class which really needed attention. Was it not desirable that some less expensive houses than those required by the Local Government Board should be allowed to be erected by the local authorities, who should have power to build dwellings simply in accordance with their own by-laws? He suggested an extension of the time for the repayment of loans.

Slums.

"The Treatment of Slum Populations" formed the subject of a paper by Mr. Paul Swain, chairman of the Sanitary Committee of the Plymouth County Council, who said that in the majority of cases failure had been the result of efforts of municipalities to provide dwellings for the working classes. Houses, as a rule, built for people displaced had not been occupied by those for whom they were intended. The result was the creation of a fresh slum. It was worse than useless to attempt to transplant this decadent mass of humanity from their congenial surroundings of squalor and misery to the serene atmosphere of municipal homes, built on the approved system of the Local Government Board. As an alternative, instead of abolishing slums, they should be reformed. For a comparatively small sum, many of these houses could be repaired and put in order, as had been done in Glasgow. It would be cheaper and more practical for municipal bodies to acquire slum properties, and to utilise them in this way rather than to spend large sums of money in building houses for the working classes, which hitherto had proved gigantic failures. But there must be firm control and a fearless and impartial treatment of all slum landlords. The good work of Glasgow was an admirable example of what might be done by private efforts. It would be quite feasible for all large towns to combine private effort with municipal authority. Why did not the various parochial organisations and philanthropic societies ally themselves with the municipal officers in their work amongst slum populations?

Mr. H. Tozer, the vice-chairman of the Committee for the Housing of the Working Classes, Westminster, said where the duty of individuals had failed in providing sufficient housing accommodation for the labour employed, it became the duty of the authorities to supply the deficiency. There existed a direct mandate to this effect from the King. Statistics were too strong to be ignored, and showed incontestably the necessity of systematic dealing with the present condition of working-class housing. It was more than a necessity. To-day it was an evil; to-morrow it might become a peril. The academic question was often raised as to how far municipalities should take upon themselves what might seem to be the duty of traders. Was not this the right axiom that municipal trading was justified and advisable where such things as were vitally necessary to the health and well-being of a community were inadequately provided by private enterprise, whether it were water, public lighting, tramways and other locomotion, housing of the poor, or other things. Our commercial supremacy, which depended in a great measure upon our raw labour, was seriously threatened, and it behoved us *inter alia* to wake up to the necessity of labour being properly sheltered. A chief and efficient system of locomotion offered the most immediate and least experimental, though not complete, solution of the housing problem.

Resolutions.

Mr. Taylor (Liverpool) proposed: "This Congress urges the Government, at the earliest possible moment, to give legislative effect to the recommendation of the Select Committee of the House of Commons that the repayment of loans on land and buildings be extended to eighty years." Mr. McGuffie (Liverpool) seconded the motion, which was carried. On the motion of Mr. Lawson, chairman of the sanitary committee, Leeds, the following resolution was also adopted:—"Local authorities should have a free hand to erect such buildings as best suit their local requirements, subject to compliance with the approved sanitary by-laws."

Mr. T. Poyntz Wright, of London, Fellow of the Institute of Public Health, read a paper on the desirability of appointing a Minister of Public Health, and moved "That in the interest of the public the health services of this country require organisation on a system suitable to modern conditions, and that this end would be furthered by the power and influence from the initiative of the Health Department of the Local Government Board being increased, and the Department formed into a Ministry of Public Health." Dr. Bushnell (Plymouth) seconded the resolution, which was adopted.

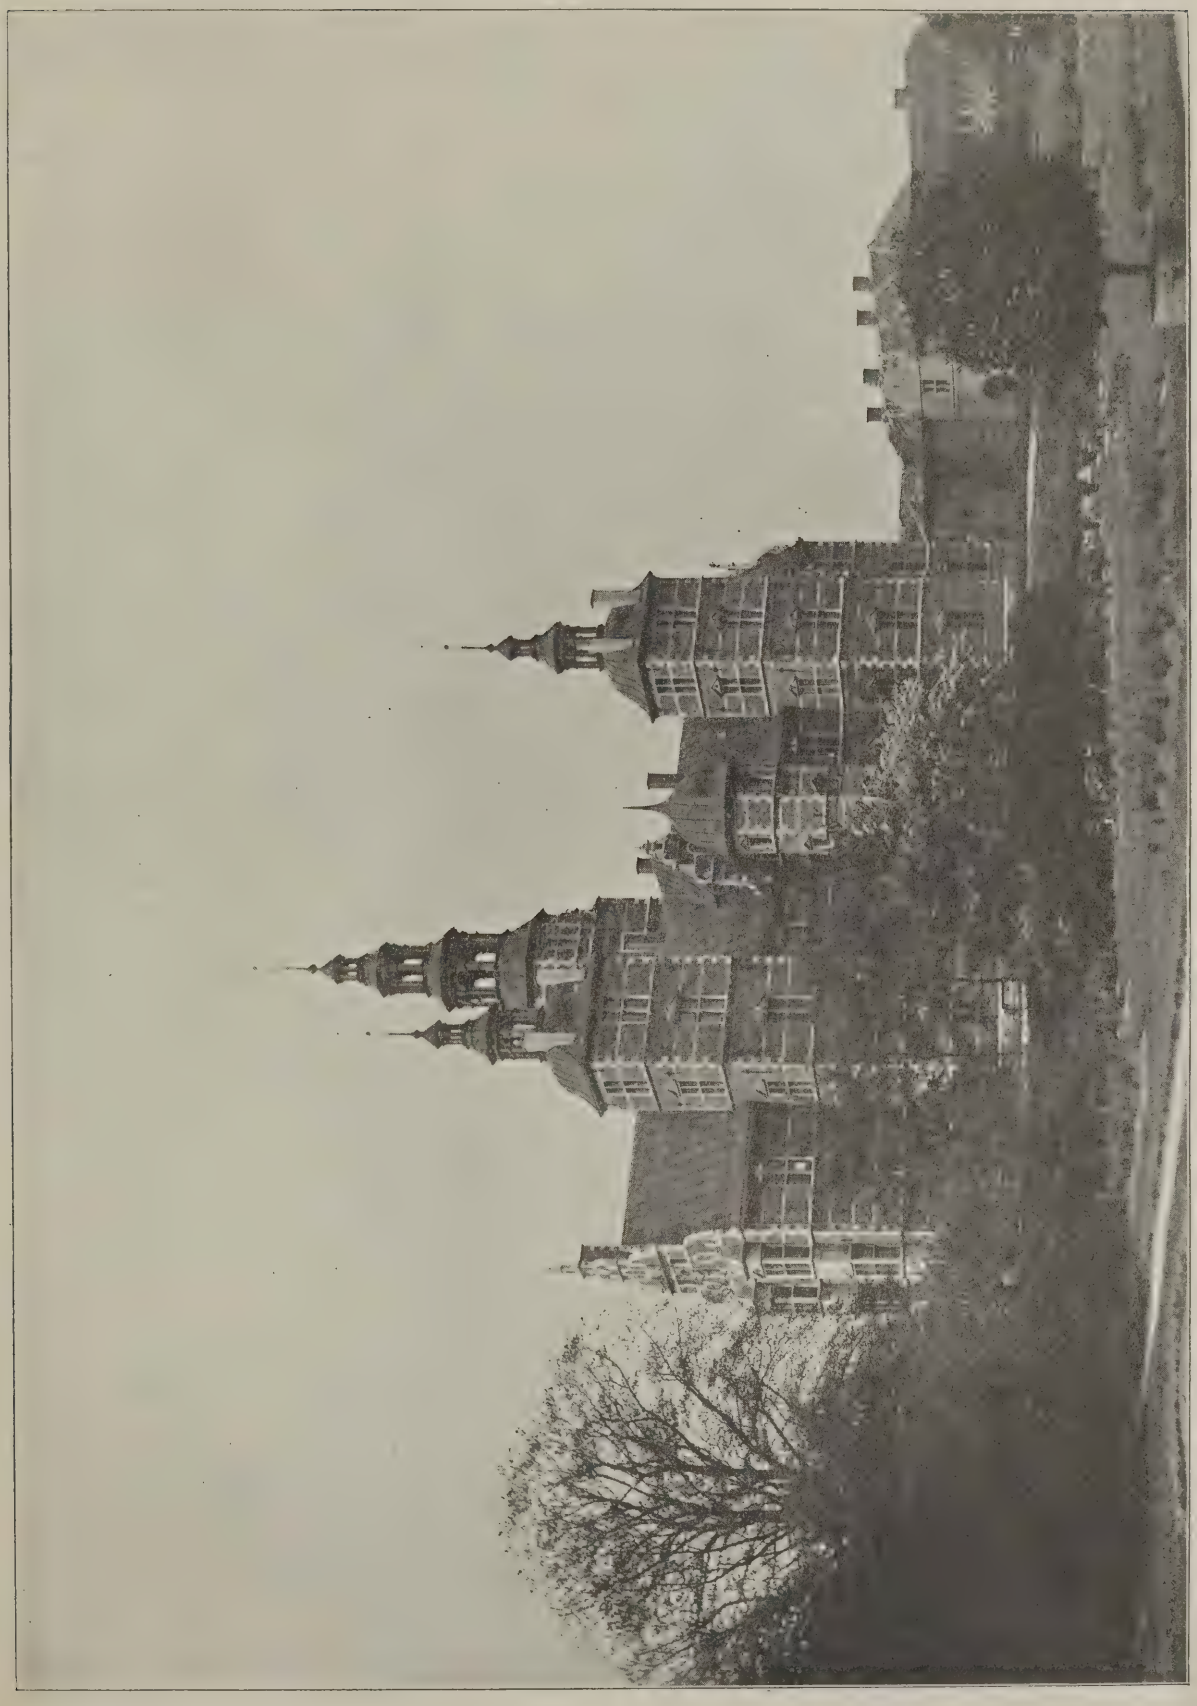
"The Plumbers' Registration Bill" was discussed in a paper by Mr. W. J. Addiscott (Plymouth), upon whose motion the following resolution was carried unanimously:—"That this Congress approves of the efforts made by the Worshipful Company of Plumbers in promoting the Plumbers' Registration Bill, believing that such a measure will be for the safeguarding of the public health and beneficial to all classes of the community, and appeals to the Government to give facilities and support to the measure."

The Congress was continued on Tuesday.

Before the Engineering and Architecture Section Mr. Donald Cameron, surveyor to the Exeter City Council, read a short paper entitled "Some Points in Municipal Sanitation," which gave rise to a discussion on the septic-tank system of sewage-disposal.

Sanatoria for Consumptives.

Dr. Frank Bushnell, hon. pathologist, South Devon and East Cornwall Hospital, Plymouth, read a paper on "Sanatoria for Consumptives," in the course of which he spoke of the sanatorium as a means of preventing tuberculosis, as a school for instruction in the principles of healthy living, and as a hospital for the restoration to health of children or adults suffering from consumption and other forms of tuberculosis. He also touched upon the need for after-care. Dealing, in conclusion, with the provision and maintenance of sanatoria, he said that both sanitary and poor-law authorities should provide for hospital accommodation for those patients affected with phthisis who, in consequence of poverty or surroundings, or the advanced stage of the disease, were unable to take the necessary precautions to prevent its extension.



Mr. Harbottle Reed, architect, of Exeter, read a paper on "The construction of sanatorium buildings for consumptives," in the course of which he remarked that, although the ordinary principles of hospital construction were involved in the erection of sanatoria, there was a wide divergence of their respective requirements in many details. There appeared, he said, to be a concensus of opinion upon the desirability of a site possessing the following advantages—abundance of fresh air, a maximum amount of sunshine, shelter from winds, dry and well-drained soil, remoteness from roads or ground productive of dust, privacy and quiet, away from all smoke and noisy factories, grounds of sufficient extent to permit of walks, and southerly or south-south-easterly aspect as a rule. There was no accepted standard plan for the disposition of the buildings, but roughly they might be placed in four groups—the large self-contained block, the connected pavilion type, the disconnected pavilion type and the chalet system. Of first consideration were the patients' bedrooms, which were best placed on the south front, with only a corridor behind them. To ensure thorough ventilation, about half of one wall should be window space. Radiators appeared to present the easiest solution of the warming problem. English sanatoria usually had sleeping chalets raised above the ground. Furniture was a point on which much care was exercised to keep as plain and free from dust as possible. One recently erected sanatorium for twenty beds cost £325 per bed, and an additional block for eight beds would only cost £150 per bed.

The following resolution, which had come before the section previously, was passed at the conclusion of the papers:—"That the Royal Institute of Public Health be asked to co-operate with the British Association of Water Engineers in drawing the attention of Government to the urgent necessity in the best interests of public health of the formation of a national water board." In the afternoon there were excursions to Sidmouth, Ottery, Newton Abbot, Dartmoor and the Exeter City Asylum.

At the annual meeting of the Institute of Public Health at Exeter on Wednesday Professor W. R. Smith, of London, was elected president. The final meeting of the Congress followed, the mayor of Exeter presiding. Various resolutions adopted at the meetings of the sections were referred to the Council of the Institute for the purpose of effect being given to them.

THE A.A. PROGRAMME.

THE Architectural Association curriculum for the session 1902-3 has just been published. As usual the pamphlet commences with suggestions for the guidance of students attending the classes, lectures and studio, the day school taking first place. The programme of lectures and papers to be read arranged for the general meetings is, as usual, a good and comprehensive one. The annual general meeting will be held on October 3rd, when Mr. Henry T. Hare, F.R.I.B.A., will deliver his presidential address and distribute the prizes. The chief papers arranged for are:—T. R. Spence on "Homer and Architecture," F. C. Eden on "Roof Coverings," C. C. Brewer on "Some Notes on Sanatoria for Consumptives," J. S. Gibson on "Architectural Practice, Real and Ideal," W. H. Bidlake on "The Study and Delineation of Old Buildings," J. Dudley Forsyth on "The Attitude of the Young Architect towards the Crafts," Prof. G. Baldwin Brown on "What is the real value of Greek work to the Modern Artist?" H. H. Statham on "The Æsthetic Treatment of Modern Bridges," H. B. Creswell and A. W. S. Cross on "Competitions," W. Henry White on "Ancient and Modern Town Houses," Banister F. Fletcher on "Palladio," A. Needham Wilson on "Architecture and the Public." The Discussion section has also arranged for a number of interesting papers and lectures, namely, Noel F. Barwell on "Some Recent Theories concerning Saxon and Early Norman Work in England," H. Munro Cautley on "The Buildings about a Farm," George P. Bankart on "Decorative Plasterwork," J. S. Blunt on "Crosses," J. H. Pearson on "Some Points in Ancient Lights Practice," T. Norman Dinwiddy on "Poor-Law Buildings," Mr. Edward Spencer on "Gold- and Silver-smith's Work," W. L. Trant Brown on "Valuations," A. M. Watson on "Some Unorthodox Views about Building," and Henry Cotman on "A Tour in Gloucestershire."

ROSENBORG CASTLE. THE EAST FRONT.

A SEAMEN'S HOSPITAL.

A NEW Seamen's Hospital at Cardiff is now being erected on a site near the Docks. The soil on which it is being built consists of soft clay or silt for a depth of 19ft. or 20ft., and below the old surface under this silt is the drift gravel. The first operation has been the raising of the level of the site by filling. Fortunately, a new graving dock was being excavated for the Mount Stuart Dry Dock Co. by Mr. James Allan, contractor, at the time this work was required, and arrangements were made with him for the necessary filling. The original ground was so soft that the new filling sank into it, and a very much larger quantity was required than appeared necessary at first. It soon became evident that the foundations for even the one-storey buildings could not be risked on this soft clay, and that they must in some way be carried down to the gravel. Piling naturally suggested itself, but on driving an experimental pile it was found that it so shook the adjoining ground as to cause a risk of injury to the houses there. The foundations have now been constructed with piers of concrete carried 2ft. into the gravel. These piers vary in dimensions according to the work they have to do, but are generally 4ft. wide and from 4ft. to 8ft. or 9ft. long. They also vary a good deal in their distance apart, from 6ft. to 9ft. or 10ft. They consist of cement-concrete for 4ft. in height from the bottom, and of lime-concrete above. A cement-concrete lintel 4ft. thick runs along the tops of the piers and forms the footing for the walls. In some parts of the building a slab of concrete takes the place of the lintels. The surface of the gravel proved to be at a very uniform level. Owing to the very soft nature of the clay great difficulty was experienced by the contractor in getting the shafts for the piers sunk, as the clay worked up from the bottom of the hole below the timbering. However, by perseverance and skill the difficulties were got over, and it is believed a thoroughly good foundation has been secured.

The superstructure will consist of the hospital wards, the administrative block, doctor's house, operating theatre, laundry, &c. The entrance to the hospital will be in Ferry Road. From the entrance porch a corridor will run straight to the wards. On the right of this corridor on entering will be a waiting-room for out-patients, with consulting-room, dispensary, &c., and a small accident ward for receiving and examining cases before sending them on to the wards. Also on the right of the corridor will be the main stairs with a bed-lift in the well of the stairs. On the left of the corridor will be the kitchen, staff-room, stores, &c., and at the end of the corridor the wards and their adjuncts. The wards will be on three floors, a main ward containing sixteen beds and a small ward with two beds on each floor—fifty-four beds in all. At the entrance to the wards will be the duty-room, with lifts, pantry, &c., and at the further end of the main ward a large day-room facing south, with lavatories, bathrooms, sink-rooms and emergency stairs. There will also be a large recreation-room on the first floor in the front of the building.

The wards and corridors will be heated by low-pressure hot water, and will, probably, be lighted by electricity. The ventilation will be natural, with air inlets near the floor, and outlets into flues near the ceiling. The incoming air will be warmed in cold weather by radiators. The floors of the wards will be of marble terrazzo. The walls and ceilings will be finished with fine Portland-cement rendering, worked to a smooth surface and painted. The operating theatre and Rontgen-ray room will be connected to the administrative block by a covered way. There will also be a small mortuary, viewing-room and postmortem-room.

The doctor's house will be at the western side of the site, and will be connected by a covered way with the administrative block. A small infectious ward is to be provided, which will have no internal communication with the rest of the building.

The buildings will be built of red bricks, with red-stone, Bath-stone and terra-cotta dressings. The surroundings appeared to suggest a building somewhat Dutch in character, and this has been attempted. With the exception of the principal front to Ferry Road, the building is quite plain.

The architect for the building is Mr. E. W. M. Corbett; the contractors are Messrs. W. Thomas & Co., Tresillian Terrace, Cardiff; and the clerk of works is Mr. John Evans, Cardiff. The contract for the filling in and raising of the site was let to Mr. James Allan for about £2,000. The contract price for the foundations is £4,000 and £17,000 for the superstructure. The total cost when equipped and furnished is estimated at over £30,000.

EVOLUTION IN DESIGN.

MR. WALTER CRANE, in the "Magazine of Art" for September, in an article on modern decorative art as shown at the Turin Exhibition, says: "There appears to be a law of evolution working in the arts of design quite as inevitably as in the natural world. Certain germinal motives, derived from forms in nature or art, are combined by the fancy of the designer. A conflict for pre-eminence, a struggle for existence, takes place in the mind of the artist, as his hand records the stages of the evolution of his design, either on paper or in some plastic material. In view of his ultimate purpose—the use and destiny of the design—certain lines, certain forms, prevail over others as the most fitting; the design sheds inessentials and takes final shape. It may closely follow the principle of its inception, or it may, passing through a multitude of complex stages, finally be evolved in some very different shape; but in either case its development proceeds much as the development of a plant from its seed germ to its full completion and flower, always strictly adapted to its environments. I would not say that forms of design, say surface-design, are always so strictly adapted, and one must always, of course, allow room for individual caprice and wilful extravagance and the desire for originality. The limits, however, of even these apparently spontaneous impulses are more restricted than might be supposed. Efforts to be new and original sometimes lead to results curiously similar in form to work of former epochs, where the constructive principle in design has been obscured. For instance, I noted in more than one new art restaurant building in the Parc Valentino (near the exhibition buildings) that which, in its general masses and distribution of ornament, in its absence of rectangles or verticals, or constructive feeling, curiously recalled buildings of the late eighteenth century, or what would be called in Hungary 'Maria Therese' type. Extremes meet, and our twentieth-century new art touches, in its least consciously artistic form, the rococo decorative confectionery of the palaces of the eighteenth century."

A New Police Court at Wilmslow has been erected for the Cheshire County Council (the architect being Mr. Beswick and the contractors Messrs. Meadows, of Southport) at a cost of about £6,000. There is a convenient court-room, and there are the usual rooms for the justices and witnesses. On the ground floor are the cells and offices for the district inspector and other officers. There is also a private residence for the chief officer, a parade ground, and accommodation for the ambulance.

Masters and Men.

Wages and Hours of Labour in 1901.—The annual report by the Labour Department of the Board of Trade on changes in rates of wages and hours of labour in the United Kingdom in 1902 has been issued. Mr. H. Llewellyn Smith, in his introductory note, mentions that for the first time since 1895 a decline in wages has to be recorded. During the past year about 430,000 workpeople received advances amounting to £41,000 per week, while 493,000 had to submit to decreases amounting to £118,000 per week. The nett weekly decrease for 1901 was thus £77,000, against increases of £209,000 in 1900 and £91,000 in 1899. The decline is accounted for mainly by the fall in miners' wages, the rise in which was the predominant feature of the statistics for the years 1898-1900. The fall in wages in this industry accounted for over 80 per cent. of the total weekly decrease in 1901. A considerable decline also occurred in the metal trades; but in the remaining industries the nett result for the year was a slight increase. It is estimated that, taking into account the various dates at which the changes came into operation, the nett decrease in the wages bill of 1901 due to changes recorded in this report was about £1,584,000. This compares with a nett increase of £6,000,000 in 1900. Mr. Llewellyn Smith remarks on the satisfactory fact that there has been an increased tendency to settle changes by conciliation or arbitration. During 1901 only 2 per cent. of the workpeople whose wages were changed were engaged in disputes on this account. This percentage is the lowest recorded. In the case of three-fourths of the workpeople the changes were arranged by conciliation, arbitration, wages boards, sliding scales and similar machinery. As regards changes of wages the following table shows the average nett increase or decrease per week in the wages of those directly affected:—

Groups of Trades.	Number of workpeople affected.	Nett amount of Increase (+) or Decrease (−) per week in Wages.	
		Total.	Average per head of those affected.
		£	s. d.
Building trades - -	39,637	+ 1,943	+ 0 11
Mining and quarrying -	725,750	− 62,635	− 1 8
Metal, engineering and shipbuilding - -	103,216	− 21,121	− 4 1
Employees of public authorities -	27,628	+ 1,833	+ 1 4

During 1901 only 29,276 workpeople were affected by changes in hours of labour, of which total 586 had their working hours lengthened and 28,690 had them shortened. The nett result was a reduction of 58,728 hours per week, or an average of two per head of those affected. In the following table the changes in 1901 are classified by groups of trades:—

Groups of Trades	Number of workpeople affected.	Aggregate amount of reduction in hours per week.	Nett average reduction in hours per week per head of those affected.
Building trades - -	4,499	3,719	0·83
Mining and quarrying -	1,072	10,377	9·68
Metal, engineering and shipbuilding trades -	1,772	4,002	2·26
Woodworking - -	638	995	1·56
Employees of public authorities - -	874	4,515	5·17

A NEW SCHOOL AT WHITWICK.

NEW Roman Catholic Day Schools at Whitwick are being erected on Parson-Wood Hill, near the Presbytery, at a cost of £5,000. The building will accommodate about 500 children. The buildings are designed on the central-hall plan, and consist of a hall 71ft. by 33ft., with nine classrooms —four on each side of the hall and one at the end—each having accommodation for fifty or sixty scholars. All the classrooms are lighted from the windows to the left-hand of the scholars, and separated from the central hall by movable glazed screens. Separate entrances and cloak-rooms are provided for boys, girls and infants, and private rooms and store closets are set apart for the head teachers.

The Central Hall.

The hall is 30ft. high at the ceiling line, and has six open hammer-beam pitch-pine principals carrying the roof. It is well lighted from each end and the sides, and as this hall can be extended to 90ft. long, it will be convenient for concerts, meetings, &c.

The whole of the floors will be in wood blocks, with the exception of the cloak-rooms, which are to be concrete slabs. All internal walls are to be lined with brown bricks to a height of 4ft. The remainder of the walls, both internally and externally, will be faced with red bricks of local manufacture. The dressings externally are of red terra-cotta and Ancaster stone. All roofs will be covered with green slates, and all ceilings plastered. The schools throughout will be heated by hot water on the low-pressure system, assisted by open fires. Numerous fresh-air inlets are allowed for, also windows to open at ceiling line. The foul air will be extracted by means of exhaust ventilators fixed in the roofs. The boys' and girls' playgrounds, which are spacious, are divided by brick walls. The whole of the works are being carried out by Mr. Walter Moss, builder, of Coalville, under the supervision of and from designs prepared by Messrs. McCarthy & Co., architects, of Coalville.

ROSENBORG: THE KNIGHTS' HALL ON THE SECOND FLOOR, SHOWING CORONATION CHAIRS AND SILVER LIONS.

Keystones.

A New Church at Worcester is to be erected in London Road.

Mr. Carnegie has offered £3,000 to Stourbridge for the erection of a free library on condition that the maximum assessment under the Free Libraries' Act was levied and a site given for the building. The offer has been accepted.

Ghent's New Art Museum.—The Triennial International Art Exhibition in Ghent was opened recently. The exhibition this year has a special importance, for with it is opened the new museum built for the town by the Government and the municipality. The new museum has a pleasant approach through a park. The exterior is simple in detail and proportions, and has a large Classic portico. The interior is well planned. There are twenty-six galleries, five of which are quite large, and a semicircular court now reserved for sculpture. The lighting is good, the decoration quiet and unobtrusive; but the colour of the wall hangings in a few of the rooms is, perhaps, too strong as a background for pictures. Eventually the museum is to be filled with the permanent collections.

At Great Yarmouth Workhouse a new steam laundry has been erected from designs by Mr. A. S. Hewitt, A.R.I.B.A., on a plot of ground on the east side of the main workhouse buildings. It consists entirely of ground-floor rooms. It is approached from and is in direct communication with the long corridor that runs through the workhouse from east to west, and is laid out as follows:—The first room is used as a receiving-room. The walls of the washhouses are lined with Cockrill-Doulton glazed tiles, and all the rooms have open roofs with top-lights and ventilators. The floors of the ironing and delivery rooms are laid with pitch-pine blocks, all the other floors being of concrete. Mr. J. D. Harman was the principal contractor, Mr. Grimble being the sub-contractor for carpentering and Mr. Gooda for the plumbing work. The entire building will be lighted by electricity. The cost of the building is about £1,700, and the machinery £850.

A New Drill Hall at Uxbridge has been erected on the private road leading to Uxbridge Vicarage. It extends 125ft., while its width, including the side walls, is 47ft. 4in. It is built of stock bricks with red facings. The hall floor is loose gravel, this being considered most suitable as a marching surface. The height of the walls at the spring of the roof is 14ft., to which about another 6ft. must be added for the centre of the gable. Rendle's "Invincible" glazing running on both sides the roof for the length of the actual hall gives daylight to the place effectively, while as to artificial light it is on the circuit of the Uxbridge and District Electric Supply Co. The fittings descend from the purlins of the hall roof and are also fixed in the more strictly official quarters and in the instructor's private dwelling. In the centre the iron-work is so supplemented and strengthened by cross-bars that when wanted this part of the hall can be turned into a gymnasium. Two emergency exits are provided on the right side of the hall; these are closed by sliding doors having Coburn's patent roller appliances. There are an officers' room, an armoury room, a recreation-room and a sergeant's room, and instructor's sitting-room, kitchen, scullery, pantry, coal-place, &c., three bedrooms and lavatories. The contractor was Mr. C. F. Kearley, of 11, High Street, Uxbridge, and of Kensington, and the architects were Messrs. Rawlence & Squarey, of Great George Street, Westminster.

Sir Campbell Clarke died recently. The deceased gentleman was educated at Bonn, and was for eighteen years sub-librarian to the British Museum. In 1870 he became Paris correspondent to the "Daily Telegraph." His knowledge of art was very considerable.

The Madeleine in Danger.—The city of Paris architects have decided that, as a measure of public safety, the cornices and chapters of the church of the Madeleine shall be examined in detail. To facilitate the work of inspection a special scaffold is to be built, which can be moved from place to place with the architects and inspectors from the Ministry of Finance. This preliminary scaffold will cost no less than £1,600.

International Exhibition of Architecture and Industrial Arts at Moscow.—According to the French "Moniteur Officiel du Commerce," an exhibition of models of the modern style of architecture and industrial art will be held in Moscow from November next to March, 1903. The exhibition will comprise:—(a) Plans and designs in architecture and industrial art, (b) photographs of buildings and interior decorations, (c) paintings and decorative sculptures, (d) furniture, bronzes, tapestries, upholsterings, mosaics, embroideries, jewellery, &c. Copies reproducing the original in a changed form will be refused.

The New Fire Station at Coventry is practically finished. The accommodation on the down floor consists of main engine-house for the reception of the fire appliances, a covered yard, stabling for six horses, repairing shop, provender store, loose box, coal stores, and watch-room, wherein will be situated the electrical appliances. Upstairs is a recreation-room for the fire brigade, committee-room, bathroom, &c. Adjacent to the main building are three cottages, which will be occupied by the engineer of the brigade and the horse drivers. By this arrangement there will always be three permanent tenants on the spot. There is also a tower 70ft. high for the drying of hose. It has been built by Messrs. John Isaac & Sons, of Great Heath, Foleshill, from plans prepared by the city engineer and surveyor (Mr. J. E. Swindlehurst). The cost of the works will amount to about £6,000.

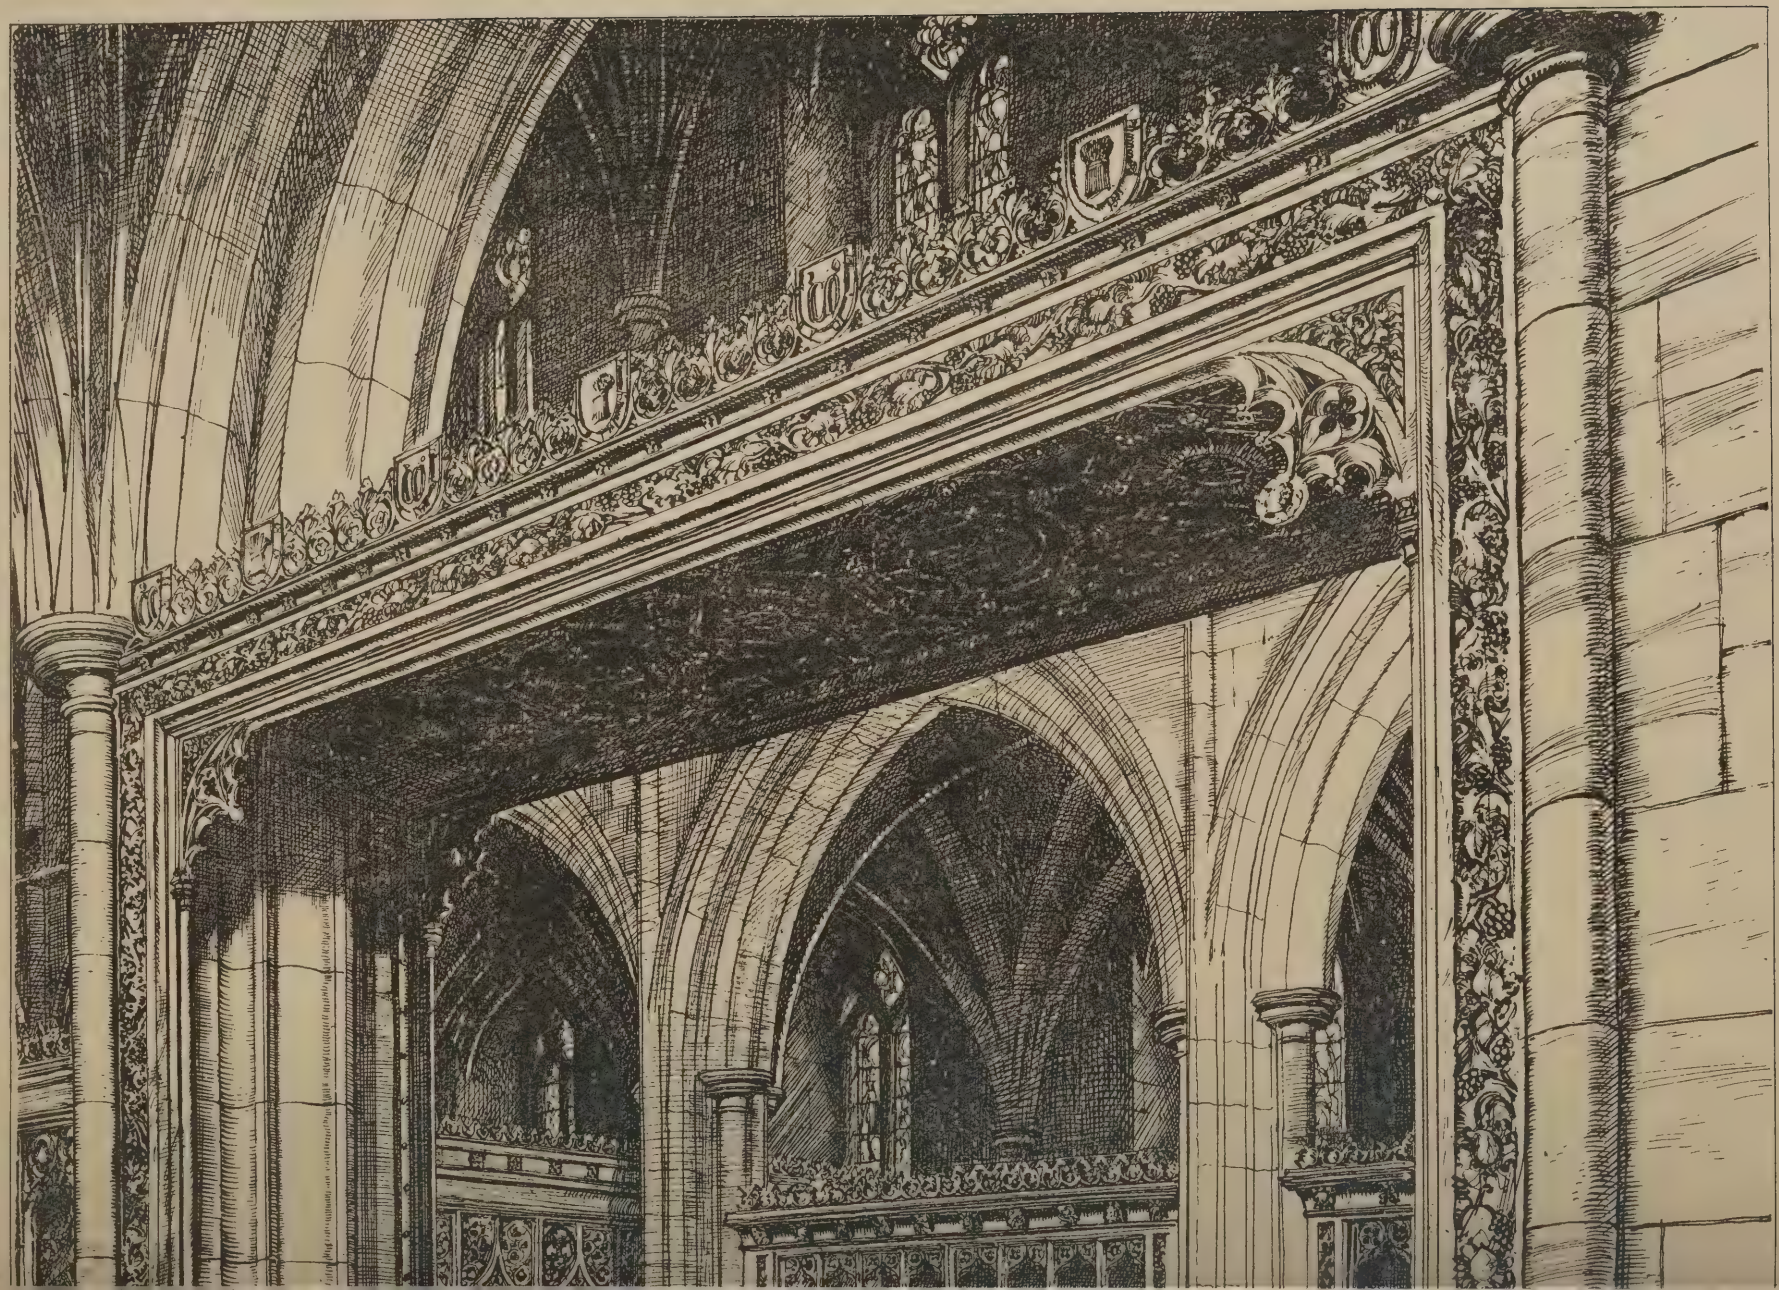
A New Sessions Hall at Lytham has been erected at a cost of about £7,000. The frontage is 66ft. in length, and the rear extends for a distance of 128ft. The building is surmounted by an octagon tower with a massive dome. There is living accommodation for an inspector, a sergeant, a married constable and six single officers. There are four cells. They are fitted with the latest improvements, lined with white enamel bricks and heated with hot-water pipes. The roof is Gothic in style, worked out in plaster. There are two leaded top-lights each 12ft. by 7ft. The floor is set with pitch-pine wood blocks on a foundation of concrete. The dock, which is a very massive piece of furniture, is situated in the centre of the court immediately behind the solicitors' bench, and is accessible from the cells below by a spiral stone staircase. The bench will accommodate fifteen magistrates sitting in double row. The magistrates enter the court from the front, and a side entrance is provided for the public. The court-room is estimated to accommodate about 200 persons. Mr. Henry Littler, architect to the Lancashire police authority, prepared the plans, and the contract for building was secured by Mr. H. Mogridge. Mr. J. Walmsley, of Preston, executed the joinery work; Mr. Forshaw, of Lytham, the plastering; Mr. J. Coulston, Blackpool, the painting; Messrs. Seward, of Lancaster, the heating apparatus and ventilation; and Messrs. Butterworth & Son, Blackpool, carried out the stonework. Mr. G. Neal, of Preston, acted as clerk of works.

Ripon Cathedral Reredos.—Mr. G. F. Bodley, R.A., has advised the committee formed to promote the erection of a permanent reredos at the east end of Ripon Cathedral that a carved stone reredos would be more suitable than one of wood, as the latter would require much gilding and colour to make it effective. He suggested that the altar be brought 6ft. (half a bay) westward. It was resolved the reredos should take the form of a memorial to the men of the diocese who have fallen in South Africa.

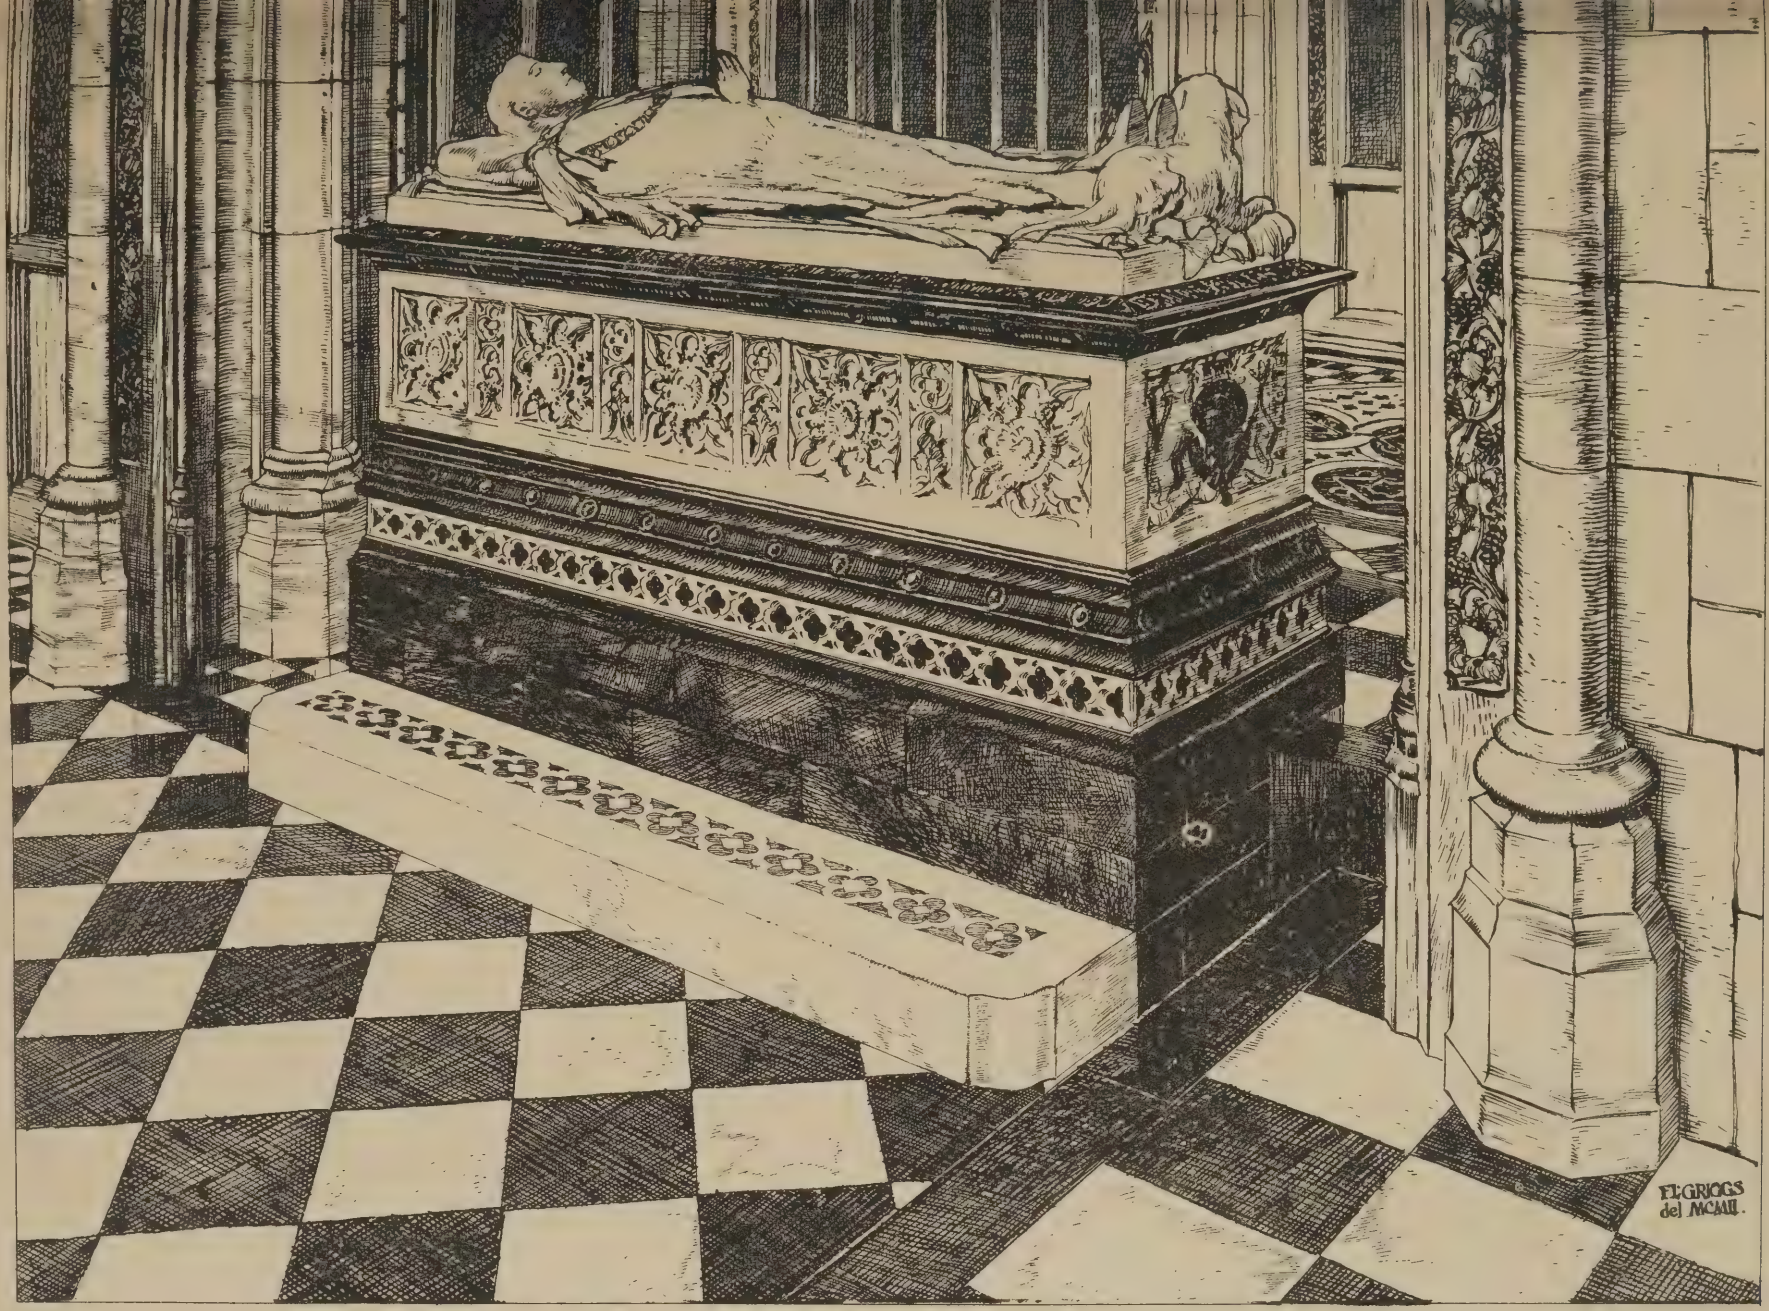
A New Primitive Methodist Church at Swalwell is being erected in Napier Road. The new structure will be of Sherburn bricks, with stone facings, and will accommodate 280 worshippers. The cost, including land, &c., is estimated at about £1,000. The building consists of chapel and a large vestry, while provision has been made for the erection of a schoolroom in the future. The internal fittings will be of varnished pine. The vestry is to be divided from the main buildings by a patent movable partition. The contractors for the work are Messrs. Shield Brothers, Swalwell, the architect being Mr. T. E. Davidson, of Newcastle.

A New Public Library at Trecynon, Aberdare, is being erected at an estimated cost of £2,000. Towards this sum Mr. Carnegie contributes £1,500, the directors of the Bwllfa Colliery Company £105, and Mr. Edward Arnott £100. Mr. D. A. Thomas, M.P., at the foundation-stone laying ceremony said he had tried to obtain similar gifts from Mr. Carnegie for the towns of Merthyr and Aberdare, but had as yet not been successful, although Mr. Carnegie had promised £1,000 for Aberaman and £700 each for Hirwain, Abercynon, Penrhiwceiber and Ynysybwl. Mr. Carnegie stipulates here, as in other cases, that the maximum assessment under the Free Libraries Act shall be levied, and that sites shall be provided free of charge.

NEW GOVERNMENT OFFICES.



A Last Effort by Mr. Leonard Stokes.



WRITING in reference to the recent discussion in the House of Commons with regard to the New Government Offices now being erected in Whitehall (see our issue for August 6th) Mr. Leonard Stokes, F.R.I.B.A., says:—

The House was told how an Advisory Committee had signed the drawings handed over to the Office of Works, and how Brydon's chief assistant had been engaged, &c., &c.; but Mr. Akers-Douglas must know perfectly well that although all this sounds very well, in the House, it really means very little; why did he not tell the House that his very Advisory Committee, to whom he pledged himself to refer all matters of detail, is against him on the board principle of the Office of Works having to complete the building at all? Why did he not tell the House that the gentleman who was Brydon's chief assistant is now quite a subordinate at the Office of Works? And last, but not least, why did he not make it clear that no full-size details were made by Brydon at all (with two trivial exceptions), and that it is just upon these very details, made full-size, that the whole life and soul of the building depends? He might have told the House all this and more, for he must know that a department has neither life nor soul, and therefore cannot impart it to anything; or if he does not know it, his successor knows it, and therefore even though the whole thing looks hopeless—and flogging a dead horse is proverbially useless—one more effort to save Brydon's building—or, at any rate, the exterior of it—might well be made under the altered circumstances of the case.

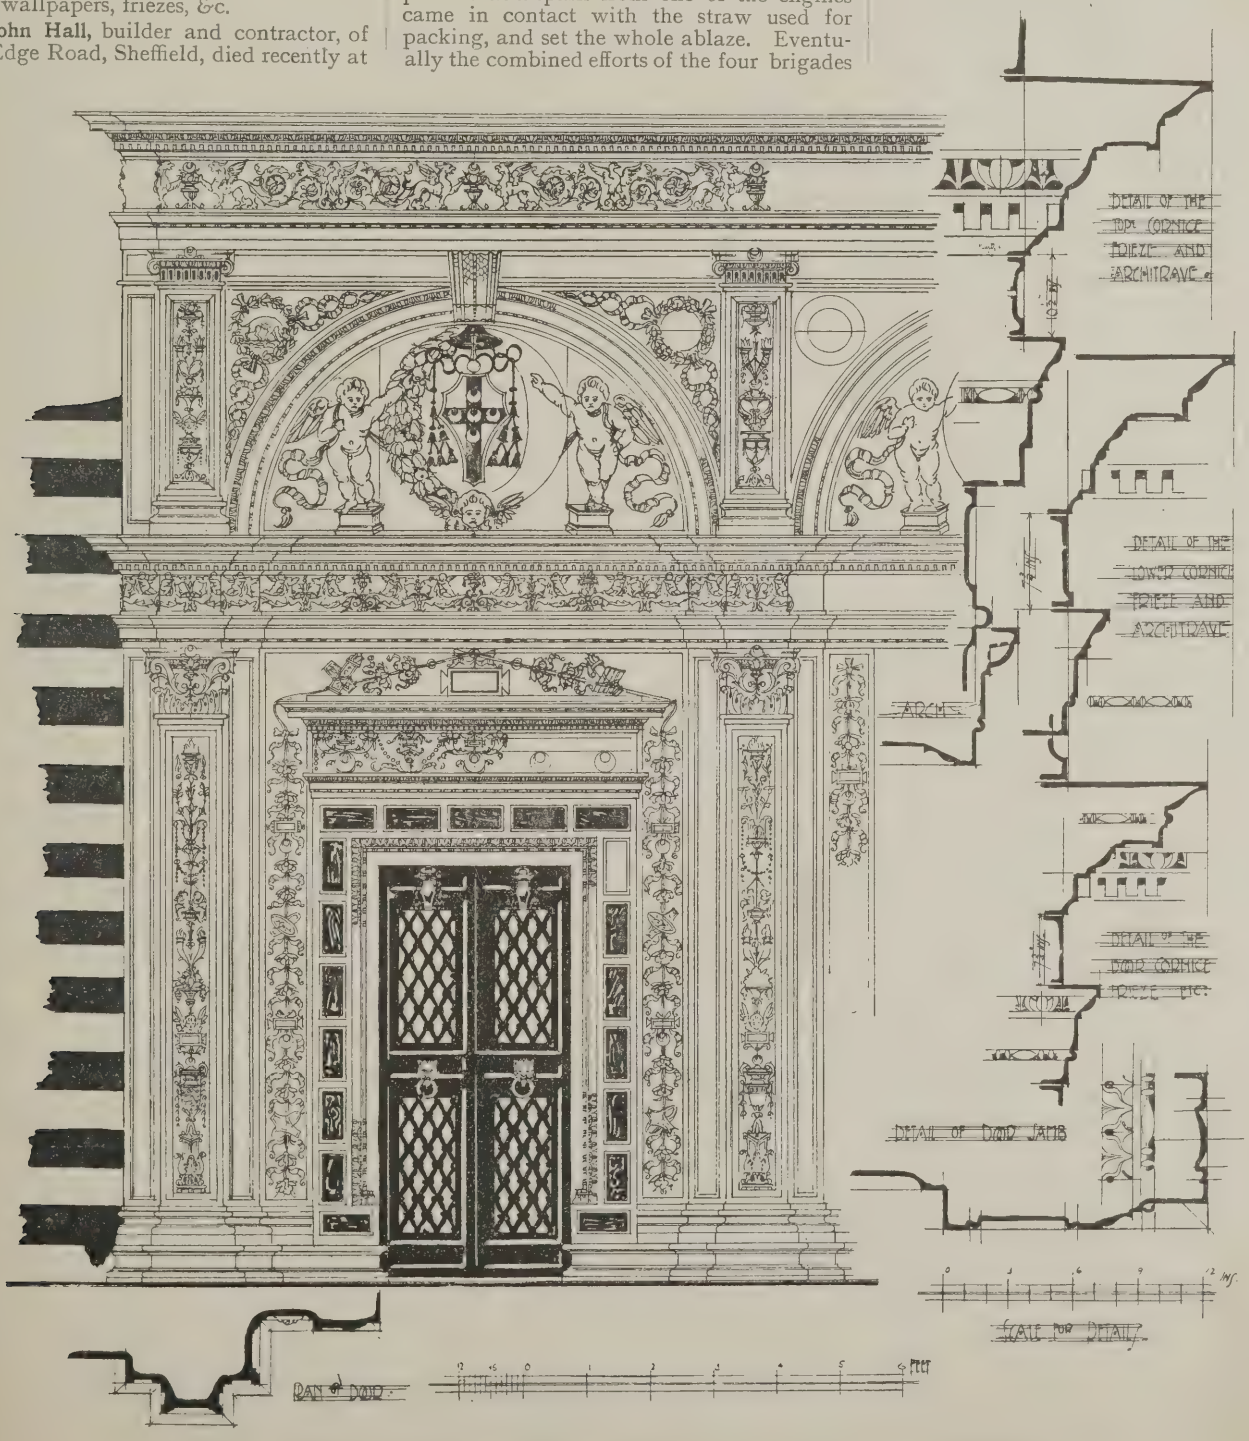
Builders' Notes.

A Red Stone Combine, we are informed, is on foot. The quarry owners have met several times, usually in Carlisle, and an announcement may be expected at any moment.



During the Shah's recent visit to London he favoured Messrs. Ewart & Son, Ltd., 346, Euston Road, N.W., with an order for one of their well-known "Success" oil geysers, to be shipped to H.I. Majesty's palace at Teheran.

Messrs. James Willats & Son, of Gray's Inn Road, Holborn, W.C., builders and decorators, plumbers, electrical gas lighting, hot water and sanitary engineers, have opened additional premises at 29, Gillingham Street, Belgravia, S.W., for the convenience of their numerous customers in the W. and S.W. districts. The new showrooms have a large assortment of electrical, gas and hot-water fittings, sanitary appliances, &c., and a special feature is the stock of patterns of 1903 season's wallpapers, friezes, &c.

Mr. John Hall, builder and contractor, of Nether Edge Road, Sheffield, died recently at the age of sixty-six years. Deceased carried on business in John Street, Sheffield, under the name of John Morton, and it was by that name that he was generally known. During his long business career he built many large premises, the Anchor Brewery, recent additions to Richdale's Brewery and several hotels being among his works. It was he who erected the Monolith. He was one of the best-known builders in the district.

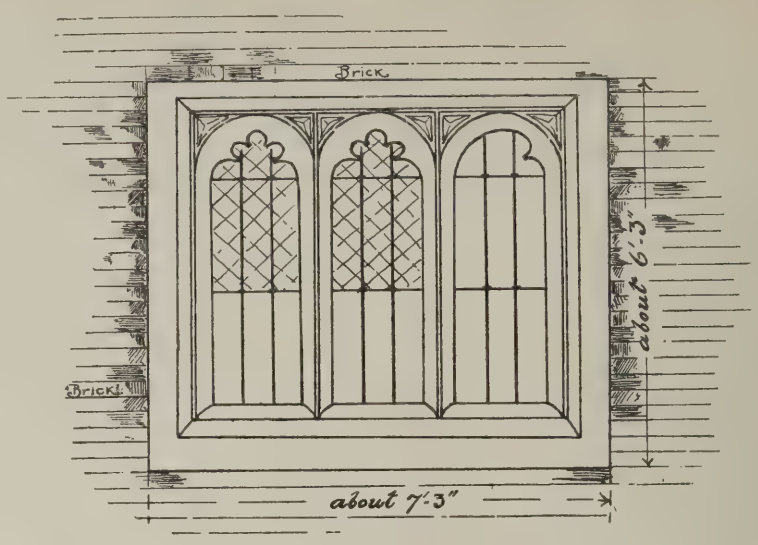
Fire at a Tile Factory.—The most disastrous fire that has occurred in the district of Swadlincote for many years broke out last Saturday week on the premises of Mansfield Brothers, Church Gresley, and destroyed the whole of one of the main portions of their encaustic tile factory. The factory adjoins the Midland Railways, and has warehouses opposite the elevated branch line to Woodville. Parallel, and within some yards, stood the hay and straw shed, with the warehouse on one side and the stables on the other. Exposed to passing locomotives, it is supposed that a spark from one of the engines came in contact with the straw used for packing, and set the whole ablaze. Eventually the combined efforts of the four brigades got the fire under, but not before the whole of the hay and straw, including the building, was destroyed and considerable damage had been done to the warehouses and stock, which is insured.

Doorway in Siena Cathedral.—The door to the library of the cathedral of Siena—formerly the Sala Piccolominea, erected in the fifteenth-century by the order of Cardinal Piccolominea, afterwards Pope Pius III.—forms a pleasant break in the somewhat monotonous lines of black and white marble of which the cathedral is built, and is famous for the fine execution of the carving by the Brothers Massini. The door is built of white marble, and with its strong projections forms an admirable study in light and shade, while some delightful spots of colour are introduced by means of the panels on the broad architrave of the door, in various coloured marbles, while the shields, bishop's hat and tassels, &c., are all blazoned in heraldic tinctures.

SIENA CATHEDRAL: DOOR TO LIBRARY. MEASURED AND DRAWN BY J. FORBES-SMITH.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.



Strength of Wall carrying Girders.

LONDON, S.W.—E. E. B. writes: "The load per ft. run on a 14in. wall 30ft. in length, height of storey 12ft., is about 1 ton per ft. super.; how much extra bearing power will be left to resist a load concentrated at a given point—taking into consideration that the bearing increases in area downwards at the rate of about 60 degs. on each side of the load along the length of 'the wall'? I send a sketch (not reproduced) showing the way I am carrying this out in practice. The load on the wall due to weight carried by girder is 20 tons. The girder rests on a hard York stone template 10in. wide, and below this are seven courses in Staffordshire blue bricks in cement in regular offsets, calculated to carry over 20 tons at the first course, and distributing the pressure so that the 3ft. 6in. wall below, built in Flettons in lime mortar (1 to 2 grey lime), has only 6 tons pressure per ft. super. I have an idea that the Staffordshire blue brick might with safety be omitted, and that by omitting them there would be less risk of an even settlement in the wall. I should think that the resistance of ten courses below a template supporting a girder might be taken at $\frac{1}{10}$th the crushing weight of the brick itself, provided the ten courses were built in cement-mortar. Below the sixth to the tenth course the load will be spread over an area sufficient to support the load. I believe no tests have yet been made on piers of pyramidal shape, which, I take it, correspond with the actual shape which supports the end of a girder bearing upon a long wall. I assume brickwork will safely carry the following loads per ft. super.:—

	Piers in lime mortar 1 to 2.	Walls in lime mortar 1 to 2.	Piers in cement mortar 1 to 4.	Walls in cement mortar 1 to 4.
Stocks - - -	2 tons	4 tons	3 tons	8 tons
Flettons - - -	—	6 tons	—	11 tons
Staffordshire blue bricks - - -	12 tons	—	20 tons	—
Firk stone - -	—	—	24 tons	—

A York stone template will be sufficiently loaded at 12 tons per ft. super., but in this case the bearing surface of girder is only about 14in. by 6in. with a load of 20 tons, giving an intensity of $\frac{20 \times 144}{14 \times 6} = 34\frac{1}{2}$ tons per ft. super. As the wall is only 14in. thick it will be necessary to spread the bearing of the girder flange by means of a thick wrought-iron plate or a cast-iron shoe, say 14in. by 18in., when the pressure on the template will be, say, $11\frac{1}{2}$ tons per sq. ft. Below the template there will be no particular advantage in using Staffordshire blue bricks as shown, although the theory of doing so is correct. It will be better to extend the stone template to allow the general walling bricks to be used throughout, say Flettons, which are safe at 6 tons per sq. ft. when laid in cement. The length of the stone template would be $\frac{20 \times 144}{14 \times 6} = 34\frac{1}{2}$in., say 3ft., and the thickness should not be less than, say, 9in. If a vertical strip of the wall 1ft. run be taken as a column, by Gordon's formula it should carry safely about 4 tons per ft. super., including its own weight, so that there will be a good margin for taking a concentrated load, but this latter will produce more than 4 tons per ft. super.; in fact, with the distributed load they will together produce on the underside of the template a load of 8 tons per sq. ft. It is evident that a pier should be built under the end of the girder, and the iron shoe can then be dispensed with. The writer does not know of any tests of pyramidal brick piers, but he would make the area of the top according to the load on it and the bottom according to the supporting material.

HENRY ADAMS.

WEST WINDOW IN TOWER, MORDEN CHURCH, SURREY
MEASURED AND DRAWN BY A. J. CLIFFORD EWEN.

Architects' Assistants' Club.

LONDON.—SPES writes: "I am a young architectural draughtsman from Scotland, and I should like to know if there is a Scottish architects' assistants' club in London."

There is no such club; but most provincial students when they come to London join the Architectural Association. Probably "Spes" had better do the same. G. A. T. M.

Books on Quantities; and the National Competition.

TORQUAY.—C. E. writes: "What book on quantities do you recommend for a beginner? Would a design for a clock-tower be suitable for the National Competition (architectural section), or should I have to choose something on a higher scale, such as a town hall or market hall? Should I have to pass a preliminary examination in architecture before I entered for the National Competition?"

Davis's "Quantity Surveying" (D Fourdrinier, 46, Catherine Street, Strand, W.C.) is the best for an absolute beginner, but Leaning's work is much more thorough, and should soon be purchased and constantly referred to. Any student in an art or science school under the Education Department may enter for the National Competition. A clock tower would be a suitable subject for a design; but to obtain recognition it should be an imposing structure, suitable for an open space in a great city. G. A. T. M.

Defective Bath Stone.

CAMBERLEY.—"Can I rightly condemn some Bath-stone window heads that have flint veins in them running from top to bottom? The specification says merely that the stone must be free from all defects, but does not specify what defects."

The terms of the specification clause are not definite enough to condemn the stone.

Cost of Porches.

HOLMFIRTH.—L. H. writes: "Kindly give an estimate of cost of a strong porch for a house greatly exposed to the weather. Size, 6ft. by 4ft. and 9ft. high, the material to be of stone; window on each side. Please compare such a porch with one of iron frame and glass."

A stone porch such as you mention would cost about £30 or £40, and an iron and glass one about £25 or £30. To give an exact estimate we should require much more information, and we advise you to consult a local architect.

Architects' Assistants Abroad.

LUTON.—ARCHITECT'S ASSISTANT writes: "Is it possible for me to get a situation in an architect's office in France or Italy? Which is the better country of the two for an architectural student to visit; and would the experience gained in two or three years greatly benefit me?"

An English architect's assistant is not likely to obtain a situation in French or Italian architects' offices without influence, though he stands a better chance in Italy. The latter country of course takes first rank for architectural monuments, but you should endeavour to visit France as well. We advise you to spend two years in Italy and a year in France.

Correspondence.

Ocean Buildings, Moorgate Street, E.C.

To the Editor of THE BUILDERS' JOURNAL.

LONDON, W.

SIR,—You will doubtless be glad to know that this building (illustrated on p. 2 of your issue for August 20th) was designed by Messrs. Kidner & Berry, of 23, Old Broad Street, E.C., and that the design was exhibited at the Royal Academy last year. Further, I have good reason for knowing that it was not influenced by Mr. Huntly-Gordon, as suggested by the writer of the article on "Recent Street Architecture in London." — Yours truly, ALBERT GRAY.

The Tower of Morden Church, Surrey, is unique because of the method by which an accident to the cusping has apparently been doctored. It is probable that either at the time of building or at some later date the cusps of the right-hand light broke away, owing to the softness of the stone used, and not being able to replace the whole head the builder rounded off the broken stone, leaving just the one odd cusp, which gives the window so curious an effect. The above sketch by Mr. A. J. Clifford Ewen is shown approximately correct to scale.

Bricks and Mortar.

Aphorism for the Week.

There is not a member, however minute it be, in Gothic architecture, at the epoch when it passed into the hands of the lay-workers, which is not prescribed by a constructive necessity.

VIOLLET-LE-DUC.

Our Plates. THE house near Llandudno is to be built on the woody slopes of a hill at Esgyryn, and will have an expansive view of the Conway Valley and of the mountains beyond. It is to be built of stone, the materials of the two cottages which previously existed on the site being utilized, and the external walls where exposed to the weather will be rendered weather-tight by cement rough-cast brought down to a tile creasing belowthe damp-course. The roof will be covered with red tiles, and the chimneys will be built of red bricks. The architect is Mr. D. F. Green, of Bolton.—With regard to the design for a pair of small country houses by Mr. F. E. Ravenscroft, all external walls are proposed to be 9in. thick, of bricks, rough-casted right down to the ground. The chimneys also are to be covered with rough-cast. There is a scarcity of light in the dining-room, which in actual working out Mr. Ravenscroft would improve by making the bay windows wider and getting another light in. The whole of the window frames would be in wood, painted pale Brunswick green, which colour also applies to the doors, eaves, stackpipes, &c. The half-timber work would be solid and of creosoted timber as used for railway sleepers. The roof would be of plain red tiles with half-round ridge tiles. There are five bedrooms and a bathroom on the first floor of each house, and an attic and box-room on the second floor of each house. A rough estimate of the cost of the pair would be £2,500. The design was exhibited in this year's Academy.—The drawing of the monument to the late Duke of Westminster in Eccleston Church, also exhibited in the Academy, is a very admirable piece of work by Mr. F. L. Griggs. The monument itself, carried out in black and white marble, is singularly well placed and in keeping with its surroundings.

BUILDINGS IN COURSE OF ERECTION FOR THE GLASGOW AND WEST OF SCOTLAND TECHNICAL COLLEGE. DAVID BARCLAY, F.R.I.B.A., ARCHITECT.

Glasgow Technical College. THE calendar for 1902-03 of the Glasgow and West of Scotland Technical College gives the full curriculum of this very extensive institution, together with the several examination papers of the past session. As a frontispiece the book has the accompanying illustration showing the buildings now in course of erection for the college, of which Mr. David Barclay is the architect. Some particulars of these buildings were given on p. 349 of our issue for July 16th last. The statistics for the past session show that the total number of students attending the college was 5,651, of whom 758 attending the evening classes were architects, measurers and others connected with the building trades.

St. Mark's Campanile. APROPOS of Sir Edwin Durning-Lawrence's proposal, referred to on p. 424 of our issue for August 14th, Mr. Alfred H. Powell writes: "I should like to ask, in the interests of old buildings and their proper mending, how such a scheme as he proposes could be efficiently carried out. He speaks of drilling holes 4in. in diameter (length not given, but presumably of any length from 3ft. to 10ft. according to the thickness of the wall to be treated) 'into the masonry' or brickwork, and then of 'pumping in' Portland-cement grout into the holes so made. It would be interesting to know (1) what he means by drilling—whether any gentler process than hammering a chisel; (2) what kind of pump he would use for so rapidly cloying a material as cement grout; (3) how an old building would 'take' the drilling of fifteen or twenty holes per diem, say 6ft. deep, into walls in which serious cracks had already developed in the same direction? Supposing each hole took two hours to 'drill'—and, as Sir Edwin estimates, there were 10,000 needed, 3ft. apart in an old and perhaps loose wall—then there would have been, in the case of the Campanile, 20,000 hours on end of jarring the old work in sets of from thirty to forty hours a day; the second hole being always begun, apparently, before the first had set, throughout the work. Apart from the very severe treatment involved, the method has the disadvantage of being work in the dark. There is a well-known better way, which admits of real building, and not, if I may say so, of tinkering with that much-abused material, Portland cement. Bell towers generally split at right angles to the wall faces and require tying, not perforation."

Winchelsea Churches. THE old parish church of Winchelsea is to be renovated. As it at present stands it is a curious relic of a church that originally must have been of cathedral-like proportions. The existing portions are the choir and chancel and remains of the transepts. The arches at the west end of the choir which originally opened into the transepts have been filled in. The choir is 56ft. in length by 28ft. in width; the chancel is 14ft. in length, and of the same width as the choir. North and south are the choir aisles, which formerly were known as the Lady Chapel and St. Nicholas Chapel. Of the nave every trace has disappeared, even the foundations having been cleared out, with the exception of the bases of the central piers, and used to repair Rye Harbour. The ruins of the transepts are most picturesque, and it is to be hoped that they will not be interfered with. Another very interesting feature is the flying buttress outside the south choir aisle. There are several fine old monuments in the interior. An appeal is now being made for £7,000 to complete the renovation of the available remains under the supervision of Mr. Micklethwaite and Mr. Somers Clarke. Besides the parish church, which is dedicated to St. Thomas-à-Becket, Winchelsea rejoiced in a number of churches and oratories of which only the slenderest remains can be found. One of these was the church of St. Giles, which disappeared in the sixteenth century. There was a church dedicated to St. Leonard at the north-west of Winchelsea. It contained an image of the patron saint, which was supposed to have a great influence in securing favourable winds. The old town was finally overwhelmed by floods in 1287, and in the year following the erection of the parish church was commenced on the new site on a hill three miles distant from the low flat island where old Winchelsea stood. The Friars Minors, too, began to move their buildings, and obtained one of the best sites in the new town. The picturesque ruins of their chapel may still be seen on private property. In the year 1318 the Black Friars established a church and monastery on a site of 12 acres, granted by King Edward II., but later they moved to a position near St. Giles's Church. Some old walls and spacious vaults are the only remains of the once commodious house and oratory. At the junction of the roads to Icklesham and Pett may be seen a gable end of one of the buildings of the Hospital of St. John. Of the Hospital of St. Bartholomew no traces remain. It is interesting to note that when the site for the new town was decided on in 1288 it was "laid out" in thirty-nine "quarters" or squares, some of which are still indicated. In less than half a century a great part of the new town was destroyed in the French invasions.

Art Teachers. MR. CARTLIDGE'S general report on Art Instruction in 1901, which forms a part of the Blue Book of Educational Reports just issued, contains a thoughtful passage on the relation of the teachers to art education. "The

teacher's force," he says, "is the force which makes or mars the school. It is, therefore, necessary that every effort should be made to attract the best men and women to the work of teaching, to make their position an honourable one, and to secure as far as possible their happiness in the conditions of their work. Teachers need encouragement and every reasonable facility for keeping up their own studies. Their efficiency would be enhanced by opportunities of literary culture, and of visits to foreign countries to see the schools, the galleries and the life of other nations. And, more than all, they should be led to the conviction that the importance of their work is generally appreciated in their own country, and that their patient and devoted service, in face of the inevitable difficulties which beset it, is realised and valued by those placed in authority over them. The general lack of enlightenment as to the real meaning of art education, and the difference between that and the teaching of drawing, often makes their task an irksome one. At present, unfortunately, the art teacher in many localities often has to submit to the dictum of such people who do not understand that it takes years of training and practice for the eye to acquire the power to see the true pitch of a shadow, the exact degree of a hue of colour, the full beauty of a sinuous line or the true harmony of a composition. Still less do they appear able to understand that the knowledge of right methods of imparting instruction in these accomplishments in art education is only to be gained after years of strenuous study. Realising that we are supposed to live in a cultured age, it seems hard to understand that in the field of education art has not yet taken its merited and natural position. The demands upon art industry are rapidly growing. Good art is no longer the exclusive possession of the wealthy. It need not in these days be inordinately costly, and as the means of production become more perfect and cheaper the demand will grow and will have to be met. And it will need all the efforts of the art teachers of the country to keep peace with the demand, by imparting a sound and up-to-date education."

ST. AIDAN'S VICARAGE LEEDS. BEDFORD AND KITSON, ARCHITECTS.

Old Buildings at Ayr. The executors of the Ayrshire and Galloway Archæological Association have, on the representations of the hon. secretary, Mr. D. W. Shaw, solicitor, Ayr, given a grant of £5 to defray the cost of further exploration in connection with the old buildings found buried in the sand in the ramparts of the Fort, Ayr. Apart from the operations to be carried out with the above sum, and which will be carried out under the superintendence of Mr. J. A. Morris, F.S.A. Scot., architect, Ayr, some further excavation has been made by the feuar, Mr. James Clark. One of the cellar-like apartments has been quite cleared out to the foundations of the four walls. The walls all round have been found to be resting on the sand, and there is no scarcement at the foundation. The approximate dimensions are 7ft. 11in. wide one way, 6ft. 4in. wide the other way, and 5ft. 5in. in height from the foundation to the spring of the arch. The arch, which has a rise of only about 5in., and is slightly over 4ft. wide at right angles to its rise, springs from the walls, which are 6ft. 4in. wide. The width of the stairs leading down to the apartment is 2ft. 2½in. The other apartment has not yet been cleared out, but, so far as can be gathered from what has been revealed, the two apartments are identical in size and construction. The stone of which they are built is a coarse white sandstone of the same character as that of which the "Auld brig" has been built, and very different from the material of which the Fort itself is built. Judging from present appearances, the building seems limited to these two apartments, although further excavation may disclose more building. In the meantime there is not much evidence that what has been unearthed ever formed any part of the old castle of Ayr. It is more suggestive of having been used as a magazine in connection with the Fort when it was occupied under Cromwell.

Surveying & Sanitation.

The Sanitary Institute holds a congress at Manchester from September 9th to 13th inclusive. There are three sections :—(1) Sanitary Science and Preventive Medicine; (2) Engineering and Architecture, and (3) Chemistry, Physics and Biology. Conferences will be held of municipal representatives, port sanitary authorities, medical officers of health, engineers and surveyors to county and other sanitary authorities, veterinary inspectors, sanitary inspectors, ladies on hygiene, and on the hygiene of school life. In connection with the congress an exhibition of apparatus and appliances relating to health and of domestic use will be held.

New Patents.

The following specifications were published on Thursday last, and are open to opposition until October 13th next. The names in italics are those of communicators of inventions. A summary of the more important of them will be given next week.

1901.—15,666, Hollick, cranes, hoisting apparatus and the like. 15,772, Hall, machinery for making slabs, plaster, cement, &c. 15,856, Kelsey, apparatus for making glue. 16,054, Gruner, flushing cisterns. 16,159, Vanes, latches. 17,507, Scott-Snell, pressure system for incandescent gas lighting 17,874, Cooper, alarm fasteners for doors and windows. 17,886, Boult (*Devise Frères*), pressing mould for artificial stone blocks. 19,143, Wakefield, sewage carriers. 19,524, Sissons, steam pile-driving machinery. 19,735, Parks & Brown, roofing tiles. 19,889, Bell, paving of streets. 21,856, Thompson (*Maschinenbau A. G. vorm. Beck & Henkel*), process for treating the substances deposited from sewage water. 22,601, Rigby, maturing Portland cement.

1902.—1,965, Jeffery, folding partitions. 12,680, Vidal, paints. 14,287, Gilgan, acetylene gas generator. 14,756, Kleinberg & Fraenkel, shower-baths. 15,107, Bertrand, paint.

Trigg's "Formal Gardens."—Her Majesty the Queen has graciously been pleased to accept the dedication of Mr. H. Inigo Trigg's work on the formal gardens of England and Scotland, the concluding part of which will be shortly issued to the subscribers by Mr. P. T. Batsford.

SONNING BRIDGES.

AN act of vandalism is proposed on the Thames by the Oxfordshire County Council. The Roads and Bridges Committee in a report on Sonning bridges said:—

"The history and circumstances of Sonning bridges were reported by the committee to the council at their meeting in February, 1892, with the intimation that the bridges would not long withstand frequent heavy traffic or serious floods. The bridges form an important means of communication between the roads leading to the River Thames, at Eye and Dunsden on the Oxford side, and at Sonning on the Berkshire side—the nearest way of crossing the river being Caversham Bridge, about three miles on one side, and Henley Bridge, about five miles on the other side; and the traffic over the bridges is considerable, and includes constant heavy traffic. At this point the river is about 300yds. wide, and is crossed by a series of three county bridges, an intervening roadway, and the bridge over the navigable part of the river, which is not a county bridge. The three bridges repairable by the County Council are situate wholly in Oxfordshire, and consist of Mill Bridge, an old wooden structure over the mill stream, 188ft. in length; New Bridge, a brick-and-timber structure over a branch of the river, 130ft. in length; and Hall's Bridge, a wooden structure over a back channel, leading from the weir, 111ft. in length—making a total length of 438ft., the average width of all the three bridges being 15ft. It being ascertained that the county bridges were getting weaker and unfit for the heavy traffic which passes over them, several members of the committee inspected the bridges, in consultation with the county surveyor, when it was evident that new piles and supports were necessary, and a further examination was made, which resulted in forcing the committee to the conclusion that it would be useless to expend money upon continual repairs of the old structures, and that a new and wider bridge would eventually prove the most economical scheme. The committee have therefore decided to recommend the removal of the existing wooden lengths, the substitution of iron piles and steel girders, the strengthening of the present brick portions and the addition of brick abutments at each end, and the widening of the bridges so as to ensure a roadway of 24ft. As it is most desirable, having regard to the state of the river and the condition of the bridges, to commence the work before the winter months, the committee request that they may be authorised to obtain and accept tenders, and to employ the county surveyor to undertake the rebuilding of the bridges, according to the plans prepared by him, at a cost not exceeding £8,000."

Naturally this proposal roused opposition among the members present at the council meeting. Sir William Markby expressed his opinion that the beauty of the Thames, a valuable possession of the county, would be destroyed by an iron girder bridge. Lord Saye and Sele urged that the council ought to have the plans before them, also observing that the renewal of the existing bridges would tend to preserve the appearance of the beautiful village of Sonning. Lord Jersey suggested the matter be deferred until the council had had some opportunity of seeing the plans and also of knowing exactly how much the cost would be. But the chairman, Mr. T. E. Cobb, observing that postponement might mean losing the season, said that he should put the question whether the report should be referred to the committee as an amendment.

The county surveyor said he very much doubted whether the Thames Conservancy had anything to do with it.

Finally the amendment was proposed by Lord Jersey, seconded by Sir W. Markby, and lost by 16 votes to 17.

Thus by a bare majority the council have practically given the county surveyor authority to destroy the existing bridge, and to set up in its place another bridge, of iron, of which they have not even seen the plans.

Law Cases.

A Claim in regard to the Quality of Bricks.—At the Darlington County Court recently, before his Honour Judge Templer, Martin Meehan, speculative builder, of Darlington, claimed £50 damages from Messrs. Cradock, Wake & Co., brickmakers, Eaglescliffe, for alleged breach of contract. The evidence was to the effect that in February last the defendants entered into a contract to supply the plaintiff with all the second bricks they had, which it was stated were contained in the three kilns known as the Newcastle kilns, and numbered between 90,000 and 100,000. The price agreed upon was 12s. 6d. per 1,000, exclusive of carriage. Having received and paid for 40,000 of the bricks, the plaintiff subsequently made application for the remainder. He was informed by the defendants, however, that they had no more second bricks, and that therefore they could not supply him with any. He had consequently to purchase about 55,000 or 60,000 from Mr. Sherwood (Yarmlane) at 30s. per 1,000, and he alleged that meanwhile the defendants had broken their contract by disposing of the bricks that he should have been supplied with to certain parties at an increased price. Charles Mathew Cradock, secretary and managing director of the firm of Cradock, Allison & Co., brickmakers, and the then secretary and managing director of Messrs. Cradock, Wake & Co., admitted that, owing to the plaintiff not removing the bricks, he forgot that they were included in the contract, and on or about April 21st sold about 1,500 of them to Messrs. Ward Brothers, and a great number of the others had crumbled away because of the wet weather and exposure. The bricks which had been sold to the other parties were a better class of brick, and were taken from different kilns. It was also stated that the plaintiff had paid an excessive price for the bricks he obtained from Mr. Sherwood, and that they were of superior quality to those supplied to him by the defendants. The judge said the defendants had accounted for practically the whole of the bricks in question, and he thought the plaintiff had shown negligence in not taking them away when they were there. His Honour entered judgment for the defendants with costs, and gave the plaintiff the liberty to take £5 out of the £21 which had been previously paid into court, the balance of the amount remaining to go to the defendants.

London Building Act.—The adjourned summons against Patman and Fotheringham, Ltd., Liverpool Road, N., under the London Building Act, 1894, came up before the City of London Court recently. The complaint of Mr. Woodthorpe, surveyor for the northern division of the City, was that the defendants, by making openings in the party walls at 54, 55 and 56, Coleman Street, had united the buildings, which were not, in the words of the Act, wholly in one occupation or adapted so to be. The magistrate said he had carefully considered the matter, and had also visited the premises. On the facts proved he held that they were not wholly in one occupation, but he found that they were adapted and suitable to be so. He was, therefore, of opinion that the case was within the exception contained in section 77 of the Act. Under the circumstances he dismissed the summons.

ST. AIDAN'S VICARAGE, LEEDS: THE DRAWING-ROOM. BEDFORD AND KITSON, ARCHITECTS.

A Stained-Glass Window in Caister Church has been erected at a cost of £300 as a memorial to the crew of the Beauchamp lifeboat, which capsized last November. It is the work of Mr. Paul Woodruff.

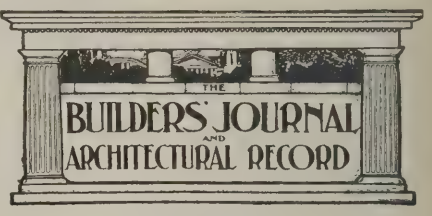
St. Aidan's Vicarage, Leeds, stands on the slope of a steep hill. The entrance door is on the half landing, with study and parish room half a storey below, and drawing-room, dining-room and offices half a storey above. By this arrangement it is found possible to keep the dwelling-house proper free from the traffic connected with the business of the parish. The house is built of Leeds pressed bricks, with Morley-stone dressings to the bay window and doors, and a red-tiled roof. The drawing-room and dining-room are separated by a folding screen, which when thrown open form a room about 42ft. by 16ft. The architects were Messrs. Bedford & Kitson, of Leeds.

Engineering Notes.

The St. Cuthbert's Schools, Pemberton, has been supplied by Messrs. E. H. Shorland & Brother, of Manchester, with their patent Manchester stoves, grates and ventilators.

Dangerous Timber Bridges.—The English sportsman and author, Mr. Bailie-Grohman, recently had a wonderful escape from death. As he was returning to the railway from shooting chamois in the Styrian Alps, the timber bridge over the Solk broke under the weight of the two horses and carriage, though the latter was but a light country vehicle. All were thrown into the torrent below, but eventually the occupants managed to reach the bank. The incident may well serve as a warning to travellers who penetrate into the unfrequented parts of the Alps, where often the flimsiest bridges of rotten timber span deep gorges. A short time ago another and yet higher bridge in the same valley gave way and tumbled into the gorge, fortunately during the night, when nobody was on it.

The British Association will begin its annual meeting at Belfast on Wednesday, September 10th. The president this year is Prof. James Dewar, F.R.S., who in his address will devote himself to the progress in physical chemistry. In the Chemistry Section a paper will be read by Dr. F. Clowes of the London County Council on "The Action of Distilled Water on Lead." In the Economic, Science and Statistics Section, Dr. Cannan in his presidential address will deal with economic theory applied to practical questions, such as housing and other municipal enterprises. The Engineering Section will be presided over by Prof. John Perry, whose address will be on the "Training of Engineers." Mr. L. L. Macassey will deal with "The Belfast Water Supply"; Mr. M. B. Field, "Exhibition of Electrical Apparatus"; Mr. H. A. Humphrey on "Recent Progress in Large Gas Engines"; Mr. L. Holroyd Smith, "The Importance of Minor Details in Engineering Work"; and Mr. G. W. Herdman with "The Direct Reducing Staff." In the Anthropology Section Miss Layard will described a new palæolithic site at Ipswich, and Messrs. Clinch, Fennell and MacRitchie will discuss the significance of British underground dwellings of neolithic and late periods. Reports will be presented on the year's excavations at Silchester and on the age of stone circles.



Japanese Steel Works.—For some years past the importance of rendering the Japanese Government independent of foreign countries for a supply of iron and steel has attracted much attention in that country. Experts were dispatched to Europe and the United States to study the great iron and steel works there. Wakamatsu, in the north-west corner of the island of Kiushiu, near the open ports of Moji and Shimonoseki, was selected as the site of the works, which cover about 320 acres, and lie on the eastern side of a large lagoon, ten miles in circumference, which is connected with a pool or basin a mile in diameter, and this, again, with the sea by a short and narrow channel. The lagoon is being deepened to 20ft. at ebb tide, and a quay over 2,000ft. long is being built along the front of the works, so that a ship of 3,000 tons displacement will be able to approach the quay wall. The work done up to the end of last year consisted of a channel 6,000ft. long, 240ft. wide and 14ft. deep, extending from the sea to the pier of the Kiushiu Railway Company. The quay and all parts of the works are connected with the main line of this railway, and there are about twenty miles of line about the works. The raw material, consisting of magnetite, hematite and a smaller quantity of zimonite, is all obtained in Japan, except some supplied from Hu-peh, in China. Two iron mines and three coal mines have been acquired for the use of the works, all within twenty miles of the latter and connected with them by rail. It is estimated that when in full working order the establishment will deal with 250,000 tons of ore per annum, 380,000 tons of coke and 800,000 of coal.

THE INTERNATIONAL FIRE EXHIBITION.

THE arrangements for the International Fire Exhibition at Earl's Court, 1903, are progressing rapidly, the British Fire Prevention Committee's scheme having met with the greatest encouragement on all sides, particularly in Government, scientific and engineering circles. The Duke of Marlborough, K.G., as president of the National Fire Brigades Union, will act as vice-president of the Advisory Council, and Mr. Edwin O. Sachs, as chairman of the British Fire Prevention Committee, will act as chairman of the executive. Mr. Marsland, hon. secretary of the Society of Architects, will perform the duties of hon. secretary of the exhibition. Among those who have consented to act on the Advisory Council, the majority of whom have expressed their intention of taking an active part in the work, are the President of the Royal Society, Sir William Huggins, the presidents of the Institution of Electrical Engineers, the Chemical Society and the Institute of Chemistry, as also Sir Douglas Fox, past-president of the Institution of Civil Engineers; Professor Aitchison, past-president of the Royal Institute of British Architects, and the President of the Royal Navy League. Among Government officials we notice the names of Sir John Taylor, K.C.B., consulting architect, and Mr. Tanner, principal architect to H.M.'s Office of Works; Colonel Bainbridge, C.B., chief superintendent of H.M.'s Ordnance Factories; Captain Thompson, Chief Inspector of Explosives; Dr. Thorpe, F.R.S., principal of the Government Laboratories; Dr. Whitelegge, C.B., Chief Inspector of Factories; Sir James Williamson, C.B., director of H.M. Dockyards; Mr. Gavey, engineer-in-chief of the G.P.O., and Sir W. H. Preece, K.C.B., consulting engineer of the same department. The historical side of the exhibition will be represented by Sir Edward Maunde Thompson, K.C.B., Director of the British Museum; Sir Henry Maxwell Lyte, K.C.B., Deputy-Keeper of the Public Records, and the president of the Archæological Association; while amongst exhibition experts we find the names of Sir Henry Trueman Wood, Mr. Dredge, C.M.G., and Mr. Isidore Spielmann; and among the scientists and electrical engineers not named above, Sir Henry Lockyer, F.R.S., Major-General Festing, F.R.S., Professor Ray Lankester, F.R.S., and Commandatore Marconi. The interest of art will be entrusted to Sir Wyke Bayliss, President of the Royal Society of British Artists, and Mr. Lionel Cust. Sir Henry Irving and Mr. Moss, of the Hippodrome, will represent the important question of safety of life from fire in our theatres and places of public amusements. Lastly, representative members of the fire, salvage and ambulance services include Major Fox, chief of the Salvage Corps; Lieut.-Colonel Seabroke, chairman of the National Fire Brigades Union; Lieut.-Colonel Dixon and Mr. J. H. Dyer, vice-presidents; Mr. Folker, hon. secretary of the same body and Capt. Dyson, of the Windsor Fire Brigade; the Ambulance Section being represented among others by Colonel Sir Herbert Perrott, Bart. As to foreign representatives acting as local corresponding committees to the Councils, the full lists are not yet to hand, except in the case of Germany, where we find, among others, the names of the Director of Public Works, the chief officer of the Berlin Royal Police Fire Brigade, and others.

OUR PUBLICATIONS.

ON SALE AT ALL BOOKSTALLS AND NEWSAGENTS THROUGHOUT THE KINGDOM.

Weekly, 2d.

ANNUAL SUBSCRIPTION, 8s. 6d.

The Review is richly illustrated, and is under the control of a Committee of eminent Architects.

A Specimen Copy will be sent upon application to the Publisher.

Monthly, 6d. nett.

ANNUAL SUBSCRIPTION, 6s.

"The Standard Technical Authority."

No. 5 Now Ready.

No. 6 (in course of preparation) will be published in December next. Orders should be sent in without delay.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.		WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
		BUILDING:		
Sept.	4	Pendlebury—Brick Walls, Stone Coping, &c.	Urban District Council	H. Entwisle, Surveyor, Council Offices, Swinton.
,,	4	Kinsale—Cottages	Rural District Council	J. Murphy, Clerk, Council Office, Workhouse, Kinsale.
,,	4	Hebden Bridge—Two Shops and Houses		Sutcliffe & Sutcliffe, Architects, Hebden Bridge.
,,	4	Salford—Coal Shed Roof	Gas Committee	W. W. Woodward, Engineer, Gas Offices, Bloom Street, Salford.
,,	5	Bradford—Extension of Markets	Corporation	T. C. Hope & Son, 23 Bank Street, Bradford.
,,	5	Stretford, Manchester—Buff Terra-Cotta	Urban District Council	E. Woodhouse, 88 Mosley Street, Manchester.
,,	5	Cromer—Chapel, Lodge, Gates and Boundary Wall at Cemetery.	Urban District Council	A. F. Scott, Surveyor, West Street, Cromer.
,,	5	Stretford—Electricity Generating Station	Urban District Council	E. Woodhouse, 88 Mosley Street, Manchester.
,,	5	Greenock—Tilework	Parish Council	Green, S.E. Mr. Fairlie, 36 Nicholson Street, Greenock.
,,	5	Leeds—Wall		City Engineer, Leeds.
,,	5	Cardiff—Building Materials	Guardians	A. J. Harris, Clerk, Queen's Chambers, Cardiff.
,,	5	Dewsbury—Chapel at Workhouse	Union Guardians	Holton & Fox, Architects, Corporation Street, Dewsbury.
,,	5	Langley, near Slough, Bucks—Seven Houses		Edgington & Summerbell, 7 Park Street, Windsor.
,,	6	Monmouth—Alterations to Post Office	Corporation	Borough Surveyor, Monmouth.
,,	6	Southgate, Pontefract—Villa Residence	R. E. Woodcock	Tennant & Bagley, Architects, Ropergate, Pontefract.
,,	6	Porthcawl, Glamorgan—Alterations, &c., to Police Station	County Council	County Surveyor, Town Hall, Bridgend.
,,	6	Troedyrhiw—Rebuilding Inn	D. Morgan & Co.	T. Roderick, Architect, Glebeland, Merthyr Tydfil.
,,	6	Penrhiwceiber—Chapel		T. Roderick, Architect, Clifton Street, Aberdare.
,,	6	Abergavenny—Renovating House		B. J. Francis, Architect, Abergavenny.
,,	6	Armagh—Rebuilding Pavilion	J. Lonsdale	H. C. Parkinson, Architect, Armagh.
,,	6	Gwithian, Cornwall—Rebuilding Hotel	Redruth Brewery Co., Ltd.	H. W. Collins, Architect, Walreddon, Redruth.
,,	6	Bradford—School	School Board	Adkin & Hill, Architects, Prudential Buildings, Bradford.
,,	7	Pontypridd—Hospital	Urban District Council	J. C. Jones, District Council Offices, Pontypridd.
,,	8	London, E.—Stores, Cart and Van Sheds, Lodge, &c.	Stepney Borough Council	M. W. Jameson, 15 Great Alie Street, Whitechapel, E.
,,	8	Truro—Rectory		Mission House, St. Mary's Street, Truro.
,,	8	Belfast Electric Power Station	Great N. Ry. Co. (Ireland)	Engineer-in-Chief, Great N. Ry. Co., Amiens Street, Dublin.
,,	8	Beetham, Westmorland—Schools		J. F. Curwen, 26 Highgate, Kendal.
,,	8	Leeds—Excavators' and Concretors' Work in Connection with Hospital Foundations.	Sanitary Committee	T. Hewson, City Engineer, Municipal Buildings, Leeds.
,,	8	Llandovery, Wales—Cattle and Sheep Market	Corporation	Clerk, Town Hall, Llandovery.
,,	8	Walsall—School	School Board	H. E. Lavender, Architect, Bridge Street, Walsall.
,,	8	Briton Ferry, Wales—Club Building	Working Men's Club & Institute	H. A. Clarke, Architect, Briton Ferry.
,,	8	Walsall—School	School Board	H. E. Lavender, Architect, Bridge Street, Walsall.
,,	8	Bont, Llanbrynmair—Minister's House		J. T. Jones, Llanbrynmair.
,,	8	Dublin—Extension of Gas Testing Station	Corporation	C. J. M'Carthy, City Architect, Municipal Buildings, Cork Hill, Dublin.
,,	9	Castlebar, co. Mayo—Crown Post Office and Caretaker's Residence.	Board of Public Works	H. Williams, Secretary, Office of Public Works, Dublin.
,,	9	Cardiff—Alterations to Electric Light Station	Great Western Railway Co.	Engineer, Newport Station.
,,	9	Enfield—Deaf Centre and Additions to School	School Board	G. E. T. Laurence, 22 Buckingham Street, Adelphi, W.C.
,,	9	Dover—Turkish Baths	Town Council	H. E. Stilgoe, Borough Engineer, Maisson Dieu House, Biggin Street, Dover.
,,	9	Belfast—Water-closets, Bathrooms, Lavatories, &c.	Union Guardians	J. C. Neeson, Clerk, Workhouse, Belfast.
,,	9	Edmonton—Portland Cement	Urban District Council	G. E. Eachus, Engineer, Town Hall, Edmonton.
,,	10	Woolwich—Additions, &c., to Premises	Union Guardians	Church, Quick & Whincop, Architects, William Street, Woolwich.
,,	10	Bargoed—Chapel		J. Evans, Bookseller, High Street, Bargoed.
,,	10	Carlton, near Wakefield—Five Cottages	Leeds Indus. Co-op. Soc., Ltd.	Works, 24 Meadow Road, Leeds.
,,	10	Chesterfield—Isolation Hospital	Joint Hospital Committee	G. E. Bolshaw, 189 Lord Street, Southport.
,,	10	Bristol—Infirmary	Union Guardians	J. J. Simpson, Clerk, St. Peter's Hospital, Bristol.
,,	10	Knighton, Plymouth—Dry Wall	Plympton St. Mary Rural District Council.	F. W. Cleverton, 4 Buckland Terrace, Plymouth.
,,	11	Hackney—Coal Stores	Borough Council	R. Hammond, 61 Victoria Street, Westminster, S.W.
,,	11	Walthamstow—Sorting Office	Commnrs. of H.M. Works, &c.	J. Wager, H.M. Office of Works, &c., Storey's Gate, Westminster.
,,	12	Hull—Synagogue and Schoolrooms	Old Hebrew Congregation	Ansdell & Cox, 50 Savile Street, Hull.
,,	12	Blackley—Lavatory	Manchester Corporation	City Architect, Town Hall, Manchester.
,,	12	Auchterderran, Scotland—School	School Board	W. Williamson, 220 High Street, Kirkcaldy.
,,	13	Dowlais—Showroom, House, &c.	Picton & Morris	T. Roderick, Architect, Glebeland, Merthyr.
,,	15	London, N.W.—Pair of Cottages, Fire Escape Shed, &c.	Hendon Urban District Council	S. S. Grimley, Engineer, Council Offices, The Burroughs, Hendon
,,	15	Llwyncelyn, Porth, Wales—School		J. Rees, Hillside Cottage, Pentre.
,,	16	Leyland, Lancs—Business Premises	Industrial Co-op. Soc., Ltd.	H. Howarth, Architect, Morecambe.

ARCHITECTS,
SURVEYORS,
ENGINEERS,

And all interested in the BUILDING and KINDRED TRADES.

The following are a few Extracts from some of these letters:—

"I have just received SPECIFICATION which I think is an indispensable book to all engaged in Municipal and Sanitary Work."

From an Inspector of Nuisances.

"If I may, I should like to add my good opinion of SPECIFICATION. As a Technical Reference it is most excellent. Several volumes in one. One would hardly like to be without it now."

From an Engineer and Surveyor.

"I have found SPECIFICATION exceedingly useful as a work of reference."

From an Engineer in the Malay States.

"The last number was the most useful book I ever had."

From a Surveyor.

"I consider the work should be in the office of every Architect, forming, as it does, in its plan and scope an invaluable source of reference in every point likely to be raised in ordinary architectural surveying practice."

From an Architect.

"SPECIFICATION is a splendid book and I will bring it before my students' notice."

From a Technical Instructor of Birmingham.

"SPECIFICATION has the World for its field. It is excellent in every department."

From a Water Engineer.

The Work can be obtained through any Newsagent, Railway Bookstall, or direct from the Publishers. Descriptive Pamphlet with full List of Sections and Summary of Special Contents will be sent free on application.

An Architectural Causerie.

The McKinley Memorial.

A memorial to the late President McKinley is to be set up in Philadelphia, and the general committee has now issued its programme of the competition to be held. From this we learn that the memorial is not to cost more than £6,000 and is to include a portrait-statue with suitable architectural surroundings. Five premiums of £100 each are offered, and the author of the successful design will, if considered worthy enough by the jury, be recommended for the execution of the work. The jury itself is a noteworthy one, as it consists of the following well-known men:—Wilson Eyre, jun., Theophilus P. Chandler, Edward H. Coates, Charles E. Dana, J. Q. A. Ward, Paul Bartlett and Frank Miles Day. Special mention should be made of the fact that the designs are to be shown by models to a scale of 1½in. to the foot—a much more satisfactory plan than paper drawings—and they are to be sent in not later than March 2nd next to Mr. Charles J. Cohen, the secretary of the Committee on Design, 320, South Broad Street, Philadelphia, Pa. At a time when we are so accustomed to see work in this country captured by Americans it would be very gratifying were the McKinley memorial to be carried out by an Englishman; but such a result is highly improbable, for the reason that there are few architects here who are capable of realising a monumental design, while in America—with such great masters as the French afford—there have been many notable achievements of this kind, the most recent being the great scheme for the remodelling of the centre of Washington.

Houses at Hunstanton.

The two houses at Boston Square, Hunstanton, illustrated on this page, are being built for Mr. William Macintosh from the designs of Mr. Herbert G. Ibberson, F.R.I.B.A., of London. The materials used are brown local stone left rough, with yellow rough-cast to the bays and gables, and plain red tiles on the roofs. Some plans of the houses are given on p. 56.

Disputes.

There are not many men engaged in the building trades to whom architects would like to entrust the development of detail: there are not many men to whom it might be said "Take this block of stone and carve it after your own device." And it is the difficulty of the problem which prevents this result being achieved, or even attempted. On the one hand are men who may be counted as so many working units of a large trade-union organisation, men to whom work is all a matter of hours and wages: on the other hand a body of master-builders, themselves perhaps trained in the same manner, to whom building is little more than a matter of keen competitive prices. It is not to our purpose now to blame either side: both are in difficult positions: but it has always been our tenet to plead for a better understanding between masters and men, for a more conciliatory spirit to be shown in cases of dispute, for a discussion of the merits of the case as between reasonable human beings, instead of a display of that animal-like ferocity to which we have been sadly accustomed in previous years. And in this matter there is no better record than the annual report of the Board of Trade. The report on the strikes and lock-outs that took place in the United Kingdom during 1901 has just been issued, and it is very satisfactory to note what improved conditions prevailed: and, further, that the early months of the present year have been so free from disputes. One of the most noteworthy points brought out in the report is the decrease in the number of persons affected by disputes in the building trades, the total being in fact the smallest during any of the five years reviewed; in 1899 the number was 30,524; in 1900 it was 19,178; while in 1901 it was only 9,797. Wages, as might be supposed, continued to be the chief cause of dispute, though, on account of the badness of trade, demands for increased wages were not so numerous as before; there was, however, a striking increase in the disputes due to proposed reductions in wages. The disputes as to hours of labour affected more persons than in any year since 1897, but they were of comparatively little importance. Another matter

SEMI-DETACHED HOUSES, BOSTON SQUARE, HUNSTANTON.
H. G. IBBERSON, F.R.I.B.A., ARCHITECT.

worth mentioning concerns that all-important matter—arbitration. During 1901 a strike of 270 plumbers at Sheffield was settled under the Conciliation Act by Mr. Thomas Blashill, F.R.I.B.A., late superintending architect to the London County Council; and a dispute affecting 300 limestone quarrymen was settled by Mr. Gordon Falcon; while reference may also be made to a strike of 420 carpenters and joiners in the Teeside and Hartlepool district, settled by a Conciliation Board; and to a prolonged dispute affecting seventy carpenters and joiners at Limerick, settled by mediation of the Most Rev. Dr. O'Dwyer and the Rev. J. M. Cregan. More strikes have been settled by conciliatory agencies in the building and mining and quarrying trades than in other trades; and altogether the report is a most hopeful one.

ST. MARTIN'S CHURCH, VERNEUIL-SUR-SEINE.*

ITS ARCHITECTURAL DEVELOPMENT.

By S. J. NICHOLL.

THE church of St. Martin at Verneuil-sur-Seine, a village on the left bank of the Seine, in the Ile de France, includes in its plan a nave with aisles, transepts, a central tower over the crossing, and a sanctuary also with aisles, all flat-ended; the whole now covered externally by one roof gabled at the ends, broken only by the lantern (or belfry tower rather) and by some irregularity at the transepts.

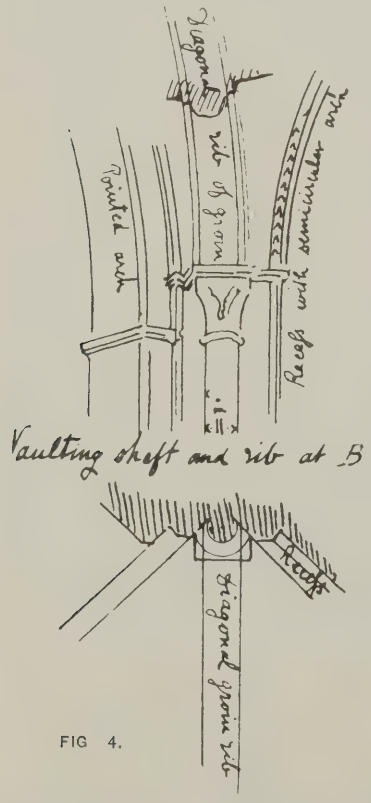

FIG 4.

The effect of the single roof is good; but it may not have been the original intention, as I see in a published restoration of a neighbouring village church (that of Vernouillet) the aisles are presumed to have had roofs of a very flat pitch, leaving the nave roof to assert itself by its sharper angle—certainly the present roof, which like that at Verneuil is in one slope, encroaches awkwardly on the very beautiful central tower with its pinnacled spire. I could not get into the roof over the vault at Verneuil, but have learnt since my visit that a window of good detail hidden by the roof has been discovered which might elucidate this subject.

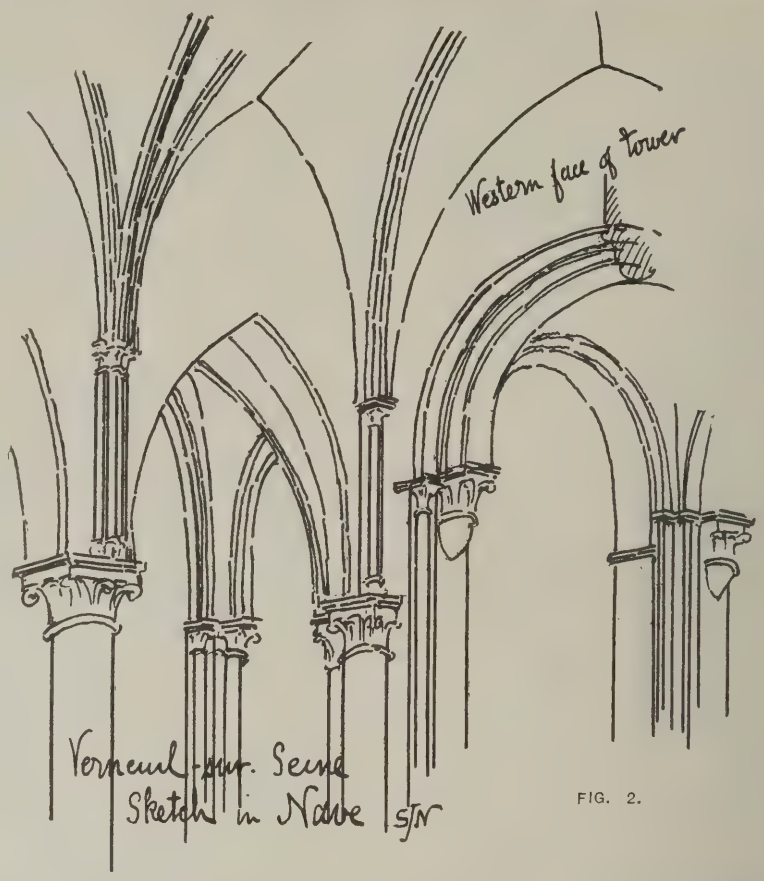

FIG. 2.

In section the nave itself rises well above the aisles, but no clearstory pierced for light appears to have been intended. In style the church is generally of the twelfth century; all the windows and the doors are round-headed, but the nave arcades, as well as the vaulting, are of early thirteenth-century work. The whole of the church is vaulted over, and deeply interested me as affording

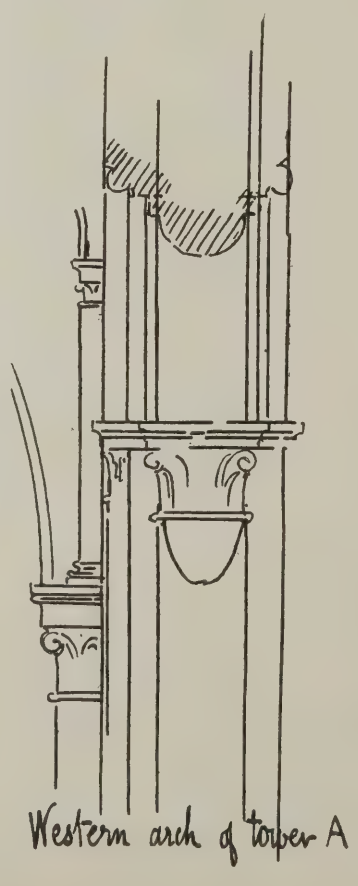

FIG. 1.

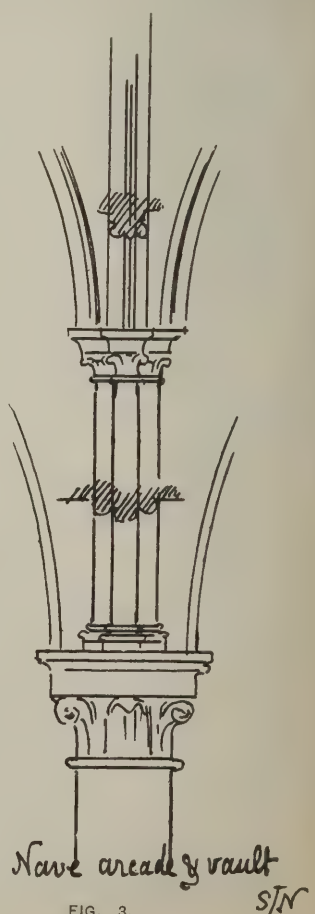

FIG. 3.

* A paper read before the Guild of St. Gregory and St. Luke.

evidence of a native growth and gradual although rapid development.

I will take the arches carrying the central tower first. They are semicircular, springing from well-designed piers and moulded in two orders with large rolls, the inner order springing from carved capitals, carried on the east and west sides by corbels so clumsily formed that there can be no doubt but that originally the shafts were continued to the ground and were cut away to open the view or for stalls (see Fig. 1).

The vault under the tower belfry is almost domical in effect and ribless. There is a small indication of a groin at the springing, but it fades away higher up. The effect is poor, and the designers evidently found it so, for, coming to the next compartment, the sanctuary, we find a change (see Fig. 2).

ST. MARTIN'S, VERNEUIL-SUR-SEINE: INTERIOR LOOKING EAST.

The side arches are pointed, but not of a Gothic section, having a plain flat soffit only relieved by a chamfer; on the east there is a shallow recess, the arch over which almost suggests a wall rib; it is carved, and, like the head of the window beneath it, is semicircular. But there is this great innovation—in the angles are circular pillars, with shafts 11in. in diameter rising from the floor, with well-designed bases placed diagonally on plan, showing that from the first inception they were intended to carry diagonal arches or ribs. These pillars have carved foliated capitals from which spring the diagonal arches which mark or strengthen the groin; they are heavily moulded to correspond in section with the arches which carry the tower (see Fig. 4).

These diagonal arches, although semicircular or elliptic in form, cross one another so as to give the effect of a Gothic vault, and were evidently intended to strengthen the groin and take away the baldness in effect of the tower vault. There is, as I observed, a slightly recessed arch to the east, but no other suggestion of wall ribs; the idea of a framework of ribs filled in with wall work had not been conceived—the idea that was eventually so logically developed in our Northern Gothic.

We now come to the nave with its cylindrical shafts, foliated capitals and pointed arches, with flat soffits, the change of intention becoming evident at the springing of the arches, where the arches and walls are formed of a thickness which allowed a triple shafted wall-pillar to rest on the capitals designed with the intention of carrying the ribs of the vaulting (see Fig. 3). Before describing this vaulting I will here note that the axis of the nave is not in a direct line with that of the eastern portion, which inclines evidently to the south. This may have been owing to an error in the setting-out of the nave, which also caused the north arcade to strike the west wall of the tower some inches beyond the impost moulding of the tower arch, leaving a space on that side which does not occur on the south.

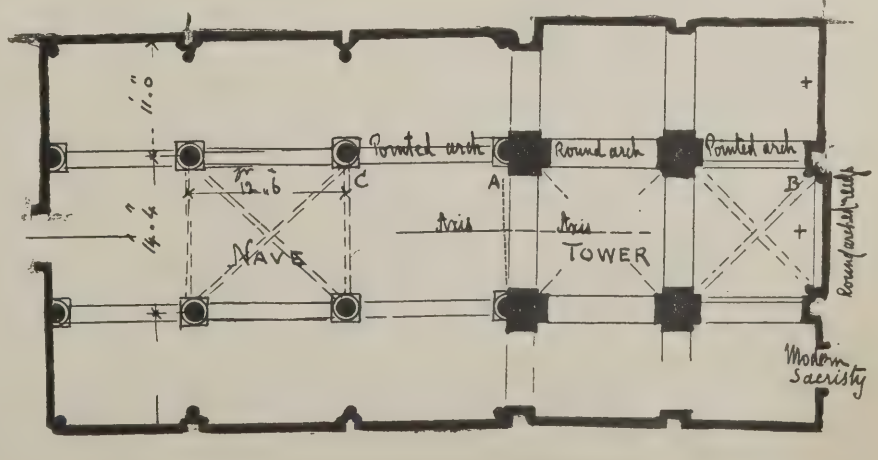
There is a theory that an æsthetic purpose was served by this curved axis, and there is also the theory of a symbolical treatment such as might be appealed to in the collect for Palm Sunday, in which the church prays that He who has "been pleased to manifest the dispensation, of our salvation, even from things insensible" may grant "that the devout hearts of the faithful may profitably understand what is mystically signified." The cruciform plan of the church would of course be in harmony with this idea.

ST. MARTIN'S, VERNEUIL-SUR-SEINE: VIEW FROM THE SOUTH-EAST.

To return to my theme of artistic development. The nave arcade is of three bays on each side, the pillars having plain cylindrical shafts 1ft. 7in. in diameter and 4ft. 7in. high, making with the base and capital a height of 10ft. 10in. The capitals have a square abacus and are well sculptured with a classic reminiscence, one, indeed, suggesting the circular bell of the Corinthian order.

From the capitals spring the longitudinal arches of the arcade, the vaulting of the aisles, and on the nave side the clustered wall pier of three shafts with well-designed bases and foliated capitals, from which grow the transverse and diagonal ribs of the groined pointed vault. There are no wall or ridge ribs; the ribs are delicately moulded, crossing at the intersections without any boss.

There is no hood mould to mark the extrados of the arcade arches, so that the space from the intrados of the arch to the vault is unbroken walling, affording noble fields for vertical mural paintings, leaving the curved surfaces of the ceiling for simple decoration. Such spaces our English churches did not provide, except in the tympanum over the chancel arches.



This treatment at Verneuil seems to me to be an inspiration of artists influenced by love of surface decoration in contrast to the framework idea of our Gothic.

The mausoleum of Placidia-Galla at Ravenna, designed for mosaic decoration, may have suggested the idea which afforded such perfect fields for mosaic or painted decoration. More than one idea was brought away from Ravenna, for the very columns of Charlemagne's tomb at Aix were spoil from some ancient structure there.

The point I have wished to emphasize is that we have here in one small church a perfect growth of style with three distinct vaulting systems naturally developed.

First, the tower immature groin; then in the sanctuary the bold and successful attempt to accentuate the groin and strengthen its construction by the heavy diagonal ribs, moulded with a Romanesque section, but giving an idea of a vault which was immediately grasped and worked out most artistically in the nave.

This small church must have been, indeed, when it had its vertical mural paintings and decorated ceiling, a joy to all around. It is still such to those who can appreciate the graces of proportion and form, beautiful curves, light and shade, skilled workmanship in construction and the sculptor's art in the carvings, sanctified by antiquity and long-continued pious usage.

ST. MARTIN'S, VERNEUIL-SUR-SEINE.

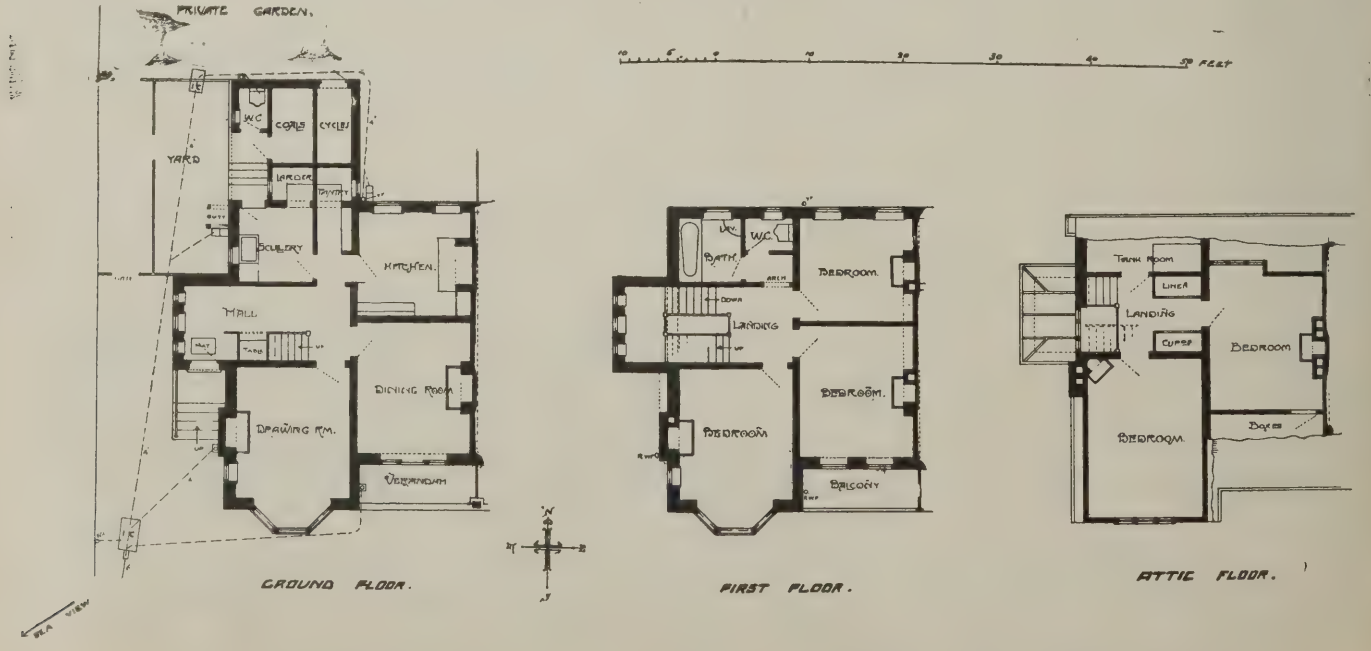
AN "ART NOUVEAU" HOUSE IN PARIS.

THE HUMBERT DE ROMANS BUILDING.

THE Parisian who, starting from the Bois de Boulogne or from the Place de l'Etoile, walks along the Avenue Victor Hugo and turns into the Rue Saint-Didier, sees on his left an edifice of very novel aspect. In front, fenced off from the street by an ornamental railing of light construction, there is a courtyard, partly covered, and on the left of this courtyard a building of a character hard to define, but which gives one the idea of a chapel whose distinctive signs are hidden by details thoroughly modern in style. Behind the courtyard and chapel stands a spacious hall, the dome of which dominates all the rest. This hall is fitted up for concerts. Everyone who passes in front of the edifice asks himself: "Whatever can this be? What is this mixture of things so dissimilar—a courtyard, a chapel and a concert hall?" What it has been intended to build at No. 60, Rue Saint-Didier is an edifice of a special kind, comprising two things, namely, a public hall and a *patronage*. (A *patronage* is a sort of school where the children and young people who attend it are taught morality and religion.)

This edifice is called the "Ecole Humbert de Romans," after an ancient monk known by his writings on religious art, and particularly on sacred music. It is also a monk, the Père Lavy, belonging to the Dominican order, who is the originator of this edifice. His idea was that it should be a school of divine art—a sort of religious and popular *Conservatoire*. Thanks to his great influence among wealthy people in Paris, the Père Lavy succeeded in collecting about £40,000 for the erection of his academy. Scarcely was the building finished, however, when for reasons which it would take too long to give here the Père Lavy found himself suddenly banished by episcopal order, and th erefore obliged to abandon his famous religious *Conservatoire* before it had even been inaugurated, and leave it in the hands of laymen. The large hall will be used for concerts—religious and secular. As to the *patronage*, which was to have been occupied by the Père Lavy, it will doubtless serve as a residence for some impressario, or perchance for a poet or a painter having a taste for a dwelling of an original kind. This, however, is a point which concerns us but little. What interests us is the structure itself, the architect of which is M. Hector Guimard, who came into prominence as an exponent of the new architecture when he designed the stations of the Paris Metropolitan Railroad.

The edifice in the Rue Saint-Didier had to comprise a concert hall capable of holding from 1,500 to 2,000 persons. It had to have a gallery. On one side there was to be a stage, with a grand organ at the back of it. Besides the hall itself there were to be the necessary subsidiary buildings, such as the cloakrooms, lavatories, vestibules and so forth. The establishment also had to have a janitor's lodge, a chapel 27 metres long by 8 metres in width for the accommodation of the Père Lavy, and a *patronage* communicating directly with the hall.



The principal facade, as already stated, is on the Rue Saint-Didier. In front of its central part, however, there is a fairly spacious courtyard, separated from the street by an ornamental iron railing 7ft. high. Entering by the doorway on the right, one first reaches an outer vestibule, in which there is a vestiary, fitted up in such a manner that the garments are hung upon pegs. Two other vestibules lead out of this first one, and the effect is that the hall has wide exits on three of its sides. These vestibules all have a floor in pink imitation marble with a pattern of lilies and golden nenuphars. They are built of stone, iron and cement, like all the lower part of the edifice, and thus are practically fireproof. They communicate with the hall by a continuous row of doors, which arrangement is very convenient and constitutes, moreover, a safeguard in case of fire.

The hall is 29yds. long and 25yds. wide. It is formed of a visible structure, springing from the ground at each corner and spreading in curves like the branches of an immense tree, in a way which gives one somewhat the idea of a corner of a druidic forest. The main branches, eight in number, support a rather high cupola, pierced, like the sides, with bays filled with pale yellow stained-glass, through which an abundance of light finds its way into the hall. The framework is of steel, but the metal is covered with mahogany in all visible places. What is in reality a thin strip of steel thus has the appearance of a thick beam. The pillars, for example, measure as much as 20in. by 15in. at the foot and 11½in. at the top. The principal rafters also measure 11½in. each way, and the principal tie-beams begin with 15½in. and finish with 10in. on each face. Nevertheless, the tie-beam being 35ft. long has a light and elegant appearance, owing to the great distance between the supporting points. Three hundred cubic meters of mahogany were used for the framework, and the result is the most elaborate roof ever conceived by a French architect. The mahogany is polished, has a warm red colour, and stands out from the voussoirs of the ceiling, which are painted orange colour, shaded gradually lighter in the direction of the spectators. These voussoirs, between the rafters, are in plaster, decorated with antique masks and with trumpeters in the corners. A part of the ornamentation has been done in sheet-iron and forged iron platbands. To the arched buttresses electric lamps are fixed in groups of twelve, having the appearance of branches of strange fruit on foliations of iron.

At the bottom of the hall there is a platform or stage, and a fine organ with forty-four stops, built by Abbey. The case of the instrument is of mahogany, in the same style as the hall. The stage is large enough to hold 100 musicians and 120 choristers.

The hall contains 1,150 numbered seats, but there is so much occupied space that an audience of 1,500 or 1,600 could easily be accommodated. The armchairs are roomy, with plenty of space between each row, and they are placed quincunx-wise, in order that everybody may have a clear view of the stage. These chairs have a light cast-iron frame in the form of branches; the seat is of green leather, stamped with curves and volutes. Two staircases lead to the upper floor, which is provided with armchairs similar to those in the hall below. On the left there is a spacious room suitable for use as a lobby or as a promenade. The balcony of this floor is in iron, and it is decorated, like the balustrades of the two staircases, with lyres and musical notes. The acoustic properties of the concert hall are excellent. It vibrates extremely well, and has no annoying echo. It is an ideal hall for stringed instruments and for the voice. It vibrates almost too much for brass instruments, which have to be moderated. M. Camille Saint-Saens gave some valuable hints in this connection, and it was upon his advice that M. Guimard, in order to obtain the requisite sonorousness, planned a proper distance between the ceiling and the roof of the hall, so that they should have a cushion of air between them.

The exterior of the edifice is built of free-stone, with certain parts in millstone, brick and iron. The carving, which is interesting here and there by reason of its fanciful treatment, has been done from models composed by M. Guimard himself, who also designed all the ornamental tiles.

SEMI-DETACHED HOUSES, BOSTON SQUARE HUNSTANTON. H. G. IBBERSON, F.R.I.B.A., ARCHITECT. (See p. 53.)

Views and Reviews.

Lighting by Acetylene.

That acetylene is a very useful illuminant for general domestic purposes in country districts is an undoubted fact. But, like many other comparatively new industries, its progress has been greatly retarded by its own votaries and in a high degree by the ignorance of the manufacturers of the generating apparatus required. A new illuminating gas which is ushered into commercial notice by explosions and fatalities, and governed by panic legislation, is not likely to attract the general public to an examination of its possibilities and undoubted virtues. Now that the subject has received some of the scientific attention and research that it required, we may hope to see the gas take its proper place among our modern lighting mediums.

The author of the handbook under notice states truly that "a good generator is the outcome of experience, and bad ones may be expected at the beginning; but makers will not always see that their machines are bad, and the result is a more widespread condemnation of the gas than would otherwise be the case." This practically summarises the difficulty against which acetylene has had to struggle. If manufacturers will not recognise the faults of their machines it is necessary that the public should be protected against them. And in this connection we would have welcomed a strong expression of opinion concerning the respective merits of non-automatic and automatic generators.

Mr. Dye deals so dispassionately with both types that it is impossible to discover in which direction his sympathies lie, but that he has come to some opinion in his own mind we can scarcely disbelieve. We have never concealed our opinion that the automatic generator was a mistake, and that its supposed advantages were more or less chimerical. The automatic type does not allow for inequalities in generation and consumption. It is difficult in a non-automatic generator of the simple carbide-into-water type to ensure that the carbide shall become thoroughly decomposed. The lumps are too often coated over with the first resulting lime, preventing the water attacking the central mass. If this difficulty manifests itself in a simple non-automatic type how much more likely is it to be troublesome in the case of the automatic pattern, with its cylinders and tubes, all barring the free access of the water?

Again in regard to consumption, the first contact means a great rush of gas, too much for the holder to contain or the burners to cope with. If the apparatus has no governor there is over-pressure at the burners and a smoky flame; with a governor there is danger to the apparatus. If we were called on to advise an intending consumer we should recommend a simple non-automatic plunge-carbide-into-water generator, a purifying chamber (the importance of this cannot be exaggerated), an independent water-seal holder or gasometer capable of containing rather more gas than is required to supply all the burners for a night, and on the house side of it a reliable governor. The plant should have its own shed at a reasonable distance from the house. The owner can charge the generator in the morning and leave the charge in till the next morning, so that the water has plenty of time to permeate and decompose the whole of the carbide. He can make the gas in large or small quantities by regulating the amount of carbide put into the generator. Thus if he has some little social function on one night he will require more gas than on others, and can regulate matters accordingly. The natural pressure exerted by the holder is regulated by the governor, which ensures a steady pressure at the burners. Such a plant is practically identical with a coal-gas works, but on a very much reduced scale.

While in no way as exhaustive as Professor Lewes's work, Mr. Dye's little manual deals very fully with the practicalities of the subject and may be recommended. Being a consumer of the gas, the book would have been more valuable if the author had given us some of his experiences as a user. The information on the different generators in the market is hardly new, and the author's opinion of the various generators would have been more useful than a plain description of their mechanism and working.

"Lighting by Acetylene." A treatise for the Practical Lighting Engineer. By Frederick Dye, M.R.I. London: E. & F. N. Spon, Ltd., 125, Strand, W.C.

Old English Furniture.

In the prefatory note to this book of 110 plates the author says: "For ingenuity and quaintness of design, richness of moulding, or profusion of ornament, the old oak furniture of England and the internal woodwork and plasterwork of our old English mansions of the seventeenth and eighteenth centuries are probably unsurpassed by the contemporaneous work of any other country; while the numerous smaller country-houses still left to us are full of most interesting detail of a more simple kind, but possessing the same originality and quaintness of spirit. It is therefore somewhat surprising that whereas so many valuable works have been published, especially of late, dealing in a more or less pictorial manner with the domestic buildings of this period, no carefully detailed work has hitherto been published particularly devoted to their furniture and internal finishings. It would require many volumes to adequately illustrate the rich abundance of this domestic work throughout the country: the author has therefore selected some of the more simple examples of domestic furniture, panelling, ceilings, &c., together with a few examples of church furniture, for illustration in his volume."

This explains what the book is. The drawings themselves are carefully done, but do not exhibit the most finished draughtsmanship, the freehand being faulty in many instances. Moreover, it is to be regretted that the dates of the several articles are not given, especially as there is not a line of descriptive matter accompanying them. The plates are simply titled thus—old oak cabinet from Poynton, Cheshire; old oak chest at Leek, Staffordshire—to give two examples. However, they form a collection of considerable interest and value, and, as the author naïvely remarks, will doubtless be freely made use of by those "whose business it is to produce similar work in modern times"—that is, commercial furniture firms. In any future edition it would be well if the plates facing sideways were arranged to be looked at from one side only: at present, owing to their being arranged in opposite ways, the head has been turned from one side to the other, a needless trouble.

"Measured Drawings of Old Oak English Furniture, also of some remains of Architectural Woodwork, Plasterwork, Metalwork, Glazing, &c." By John Weymouth Hurrell. London: B. T. Batsford, 94, High Holborn, W.C. Price 42s. nett.

ADDITIONS TO THE ROUND TOWER, BURNHAM. EDGAR S. UNDERWOOD, ARCHITECT.

Additions to the Round Tower, Burnham.—The drawing illustrated above was exhibited in this year's Academy exhibition. The architect is Mr. Edgar S. Underwood.

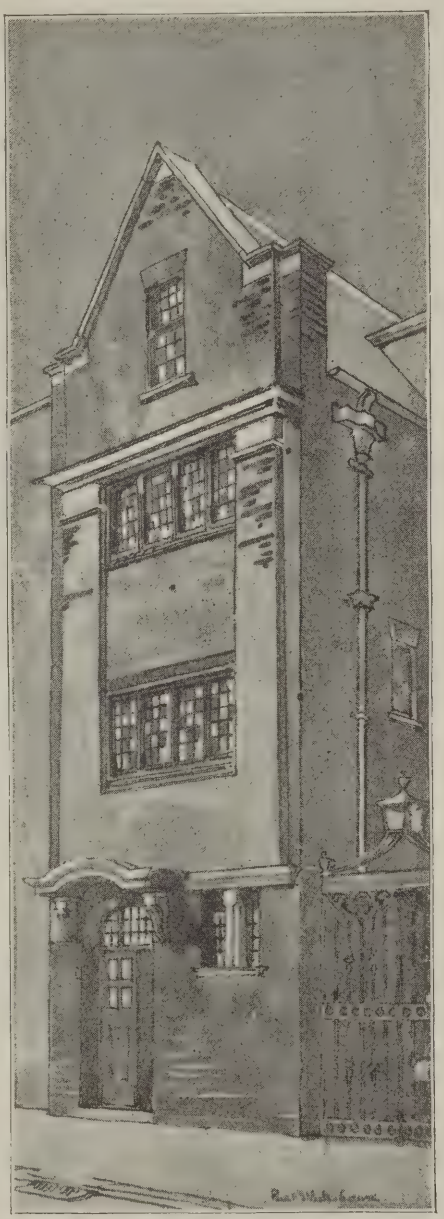
TECHNICAL BOOKS IN LIBRARIES.*

ENGINEERING EDUCATION.

By Prof. C. F. BURGESS,

THE library, in placing at the disposal of the workman-artisan class the literature best suited to their needs, may accomplish results of inestimable value. "The vast number of workers, so important to the future welfare of the Republic, deserve and are in need of more consideration and encouragement for self-education than are those who constitute what are known as our educated classes." It is to the means of giving aid to this class that I wish especially to direct attention.

Libraries have been and are at the present time very inefficiently dealing with this matter, the following remark recently made by a prominent technical man emphasizing this point: "Instruction in engineering literature is not organised, it is not looked after, it is not cared for, yet it is one of the most important questions. On entering a modern public library one finds excellent reading lists upon almost any topic in history, art, literature and some science, but none on engineering or technical subjects."



A study of methods of increasing the efficiency reveals some of the causes of inefficiency, principal among which is the lack of a sufficient number of books, and, what is equally harmful, the presence on the shelves of books whose influence is not only indifferent but actually harmful.

Certain branches of engineering and science, especially those capable of pictorial treatment, have been subjected to a flood of literature during recent years. The greater part of such literature, in spite of popularity as shown by calls for it, is not only unreliable and worthless, but is actually harmful and a hindrance to true progress in engineering education. It is to be deplored that those who represent the most advanced learning in their profession seldom indulge in the writing of elementary books, since the financial reward for such work is not comparable to that which may be received in more strictly professional work. The writing of the elementary book is therefore left to the amateur engineer. The public demand may seem to make it necessary to place many undesirable books on the shelves, but it seems to me that just as much care should be used in barring misleading books in science and engineering as in excluding those which are detrimental from the moral standpoint.

In arguing for the organisation and more efficient operation of scientific and engineering departments in the public library, with the view of helping especially the working-class, I am well aware that nothing new or heretofore untried is being presented. I will anticipate some of the objections which may be raised against this system for industrial betterment. It will be argued that certain libraries have maintained technical departments at considerable expenditure of capital and labour, but that little interest has been manifested in them by the people who were to be benefited. It is true that only a small percentage of the industrial workers seem to have an ambition to rise, strange as this statement may seem, and, even if possessed of such, few have the enterprise to do the extra work necessary to further this ambition. The results, however, which can be effected by ministering to the requirements of those who have both ambition and enterprise, even though such number be small at present, is a sufficient argument for carrying on the work. In this way the library may serve as a net spread wide to catch the talent which the country produces.

*Portions of a paper read at the Annual Convention of the American Library Association.

It may be said that manufacturers have installed libraries in connection with their works, and have even offered free instruction to their employees. The indifferent success which such attempts to improve the men have met points to possible failure for public libraries if they take up this work. It has been a matter of common experience, however, that advantages such as gratuitous instruction offered by employers are seldom appreciated by employees, for the majority become suspicious of the intentions, feeling that such efforts are being made in the interest of capital rather than of labour. To the library this is a matter of less moment, as the public may be made to have a feeling of ownership, which is synonymous with a feeling of interest. There may be means whereby the library may increase such interest.

MAURICE HOSTEL, HOXTON, N.
PAUL WATERHOUSE M.A., F.R.I.B.A., ARCHITECT.

An experiment with this in view is to be tried by the public library at Madison, Wis., during the coming winter. It is proposed to have a series of informal talks or lectures, given to the employees of local factories upon technical subjects which may be of interest to them, a small charge to be made for the course. The proceeds are to be used for the benefit of the technical library, books and periodicals being purchased which will be of most service to the contributors. Experience has shown that a free course of lectures will not retain the interest of the audience as will a course in which money is invested, and, in addition to retaining such interest, it is thought that the investment of the proceeds as before mentioned will increase the interest in the library. The lectures are to be given by local engineers and professors of the College of Engineering of the University of Wisconsin. Almost any public library can easily get up such a course of talks, as the technical men of the community will readily lend their assistance.

The library to be a place of study requires a good list of reference-books and journals. Current technical and trade periodicals would be a drawing card, and those who possess, even in a minor degree, the ability of self-education will find here their mental nourishment. In almost every industry there are now technical books and trade journals and catalogues of very high educational value, which may be acquired at a very small cost. A most valuable part of engineering and scientific literature is in such publications, and with bound volumes of the same the librarian might readily compile reading lists for those who desire to look up any particular subject. By suitable scientific instruction the usefulness of the industrial worker to society is increased, his horizon is broadened, the dignity of his calling is developed, and no other agency seems as universally suited for furnishing such instruction as does the public library.

MAURICE HOSTEL, HOXTON, N.

THE new building of Maurice Hostel, illustrated on this page, is situate in Britannia Street, Hoxton, London, N. The hostel is the "settlement" of the Christian Social Union, and the structure contains a meeting-room holding 100 persons, clubrooms, billiard-room, bedrooms for male residents, and a common-room or library. The site, a very awkward one, necessitated some peculiarities of treatment, and the demands of economy dictated the employment of the cheapest possible materials. The external effect is secured by the use of Fletton bricks and stocks, the latter being sparingly used, as they were at the time much more costly than Flettons. The cornice is in cement, the doorway and ground-floor window are of Portland stone, and for motives of cleanliness the base of the building is faced with salt-glazed bricks. The hall has a salt-glazed dado, above which the walls are colour-washed without plaster. The internal joinery is extremely simple, the doors being ledged doors with latches and rim locks, and plastering has been dispensed with wherever possible. Messrs. R. E. Worsley & Co. were the contractors selected in limited competition, and the architect is Mr. Paul Waterhouse.

At St. Mary's Church, Bolton, considerable alterations and improvements are being effected. The church, a cruciform Gothic building, with a tower at the intersection of the transepts, was erected about fifty years ago. The nave, which is without aisles, was seated with pews which ran flush to the walls on either side, and the central passage was partly filled with free benches for the use of the poor. The alterations now in progress at St. Mary's will leave the central passage open and also provide side ways, rendering access to the seats more convenient. New seats of more artistic design and more suitable material will replace the old pews, the church will be refloored, the roof retiled, and the font removed to the south entrance. Other improvements include the renovation of the organ and the recolouring of the walls. Mr. W. Wallace is the architect.

HADDON HALL IN PRINT.

By F. H. CHEETHAM.

". . . . where harmony results
From disunited parts; and shapes minute,
At once distinct and blended, boldly form
One vast majestic whole. No modern art
Had marr'd with misplac'd symmetry the pile."

A GOOD deal has been written from time to time concerning Haddon Hall, but when the student, visiting the old Derbyshire house for the first time, wishes to supplement his own observation by reference to writings which he knows to exist, he will be likely to encounter some difficulty in finding anything more at hand than one or two local guide-books that do not carry him very far.

It is with the object of facilitating the work of those who wish to know something of the architecture and history of Haddon Hall that this article is written. It does not in any sense pretend to be a complete bibliography of Haddon, though it may be taken as an attempt towards one. The task of drawing up a complete bibliography would mean the tabulating of a great mass of ephemeral magazine and newspaper literature, which, though not without profit, is not our immediate concern.

The County Histories.

In all histories of the county of Derby and in all guide-books to the district there is, of course, reference to Haddon Hall. These old county histories are not, however, very accessible, and usually devote more space to genealogy than to architecture. As a rule, they contribute little to the knowledge of the architectural student. But if they are procurable (and they should be in all good public libraries), Glover's and Lysons' histories of Derbyshire can be consulted to some advantage. Glover has a good description of the Hall, and although Lysons gives but a poor description of the building the plans he publishes are extremely correct and minute. These are, first, a basement plan of the north-west corner; second, a ground plan; and, third, an upper-floor plan. These plans were made by the surveyor of the fifth Duke of Rutland to illustrate a litttle privately-printed account of Haddon, written by himself, and were lent to Lysons for his work—the "Magna Britannia," of which this history of Derbyshire is the fifth volume.

Guide-Books.

The ordinary guide-book is, of course, written for general readers, but there are one or two guides sold at Haddon and in the neighbourhood which, being written by antiquaries and men with a thorough knowledge of the old house, are of great value to the student as well as of interest to the tourist.

The most popular of these is the late Mr. A. E. Cokayne's "A Day in the Peak." Its price is 6d. Its whole scope comprises a description of Bakewell Church, Haddon Hall and Chatsworth House. The portion devoted to Haddon comprises about fifty pages, and can be confidently recommended as one of the best guide-books ever given to the public. Mr. Cokayne was a member of the British Archæological Association and of the Derbyshire Archæological Society.

The late Mr. Llewellynn Jewitt, F.S.A., wrote a description of Haddon Hall for the publication called "The Stately Homes of England" which appeared under the names of himself and Mr. S. C. Hall. The article on Haddon was revised and reprinted as an "illustrated guide." Mr. Jewitt's name is in itself a sufficient recommendation for the value of this little book. Some copies are usually to be found on sale in the Hall.

The late Duchess of Rutland wrote an essay on Haddon Hall in the "Quarterly Review" for January, 1890. This essay deals more with the family history of the Vernons and Mannerses than with the Hall itself, but it is of considerable interest. It was afterwards republished as a pamphlet under the title "Haddon Hall; being notes on its history." Added to the original essay is a descriptive paper on Haddon by the Duchess, which appeared in "The Queen" newspaper for December 22nd, 1888. The price of this little book is 6d. It is sold at Bakewell, and in the neighbourhood.

Another local publication which should be read by all those who are interested in the past, is "Selections from the Stewards' accounts preserved at Haddon Hall from 1549 to 1671." These have been published by Mr. W. A. Carrington, of Bakewell, the curator of the Duke of Rutland's manuscripts. They throw a flood of light on the life at Haddon Hall in the time of Sir George Vernon and the early Mannerses. The price is 1s.

Other Books, Papers and Descriptions.

Leaving now those sources of information that are near at hand to all visitors to Haddon Hall, we must pass to those which, if more difficult of access, are at the same time of greater value to the architect than any of those yet mentioned. Even Mr. Cokayne and Mr. Jewitt, writing for the tourist, leave us in ignorance of much we should like to know.

Perhaps the best architectural description of Haddon Hall is that to be found in the paper read by the late Mr. Henry Duesbury before the British Archæological Association at Haddon in 1851. The Association met that year at Derby. The paper will be found, along with a plan showing the approximate dates of the erection of the building, in Vol. VII. of the Journal of the British Archæological Association (1852). Nearly all subsequent writers on Haddon owe much to Mr. Duesbury, though in too many instances they do not acknowledge the debt.

There is a quaint description of Haddon Hall, with a still quainter plan, in the sixth volume of "Archæologia" (1782). It occurs in in the paper entitled "Sequel to the observations on Ancient Castles," by Edward King. It is far from being a trustworthy description, but has some value from the date of its composition. The plan is drawn in single thick lines, and is only valuable as a curiosity. "It is not, indeed, quite so exact as I could wish," says Mr. King, "being drawn only from the eye, and in some degree from memory." Mr. King's description of Haddon, it may be pointed out, does not occur in his great work, "Observations on Ancient Castles," but in this "Sequel" in the sixth volume of "Archæologia."

In his "Churches of Derbyshire," Vol. II., Dr. Cox has a chapter on the chapelry of Haddon.

In Parker's "Domestic Architecture of the Middle Ages," Vol. III., part 2, will be found a short description of Haddon Hall, with a plan.

In 1842 Mr. Douglas Morison published a large folio volume of drawings of Haddon Hall. The book is now difficult to procure. There are twenty-six drawings, which are, however, too bold and free and imaginative to be wholly satisfactory.

The best existing illustrations of Haddon are still to be found in Rayner's work, published in 1836 in two folio volumes. The title-page reads, "The History and Antiquities of Haddon Hall, illustrated by thirty-two highly-finished drawings, with an account of the Hall in its present state, by S. Rayner." This book is unsurpassed. A thin supplementary volume in a paper cover was issued in 1837 by Mr. Duesbury, and contains a plan and measured details of the woodwork, plaster and ironwork in the building. There is a smaller edition of Rayner's work in one volume. The work is, of course, only to be obtained second-hand.

"Haddon Hall, illustrated by W. E. Cooke" was published in 1892. It is a folio volume containing some forty-eight pencil sketches of varying merit.

"Descriptive Notes on the Tapestry in Haddon Hall," by Lady Victoria Manners, is a little book the title of which explains itself. The price is 1s.

Of my own shilling brochure entitled "Architectural and Historical Notes on Haddon Hall" I need only say that it is an attempt in a popular form to supply the deficiencies of other guide-books on the architectural side. It tries to make the Hall interesting to visitors as a piece of architecture.

In Mr. Leyland's "Peak of Derbyshire" will be found some drawings of Haddon by Mr. Herbert Railton. These, with Mr. Leyland's descriptive notes, appeared originally, I believe, in "The Portfolio."

On the mass of information contained in a thousand-and-one newspaper and magazine articles I can only briefly touch.

The R.I.B.A. extra silver medal drawings of Haddon Hall, by Mr. Frank Bellis, were reproduced in "The Building News" of February 11th, 18th, and March 11th, 1887.

The Architectural Association visited Haddon in August, 1888. The professional papers of that date give accounts of the visit, and some of them published illustrations.

In the "Builder" of January 12th, 1889, Mr. J. A. Gotch wrote a description of the building, the result of the A.A. visit, which was admirably illustrated by Mr. T. Garratt. This article was afterwards published as a shilling paper-backed book, bearing on its title-page "A Short Account of Haddon Hall, by J. Alfred Gotch, F.R.I.B.A., with over twenty illustrations by Thomas Garratt, A.R.I.B.A." It has long been out of print.

Mr. R. Morison Marnock wrote a valuable paper on the woodwork at Haddon, which appeared in the "Building News" for April 2nd and 16th, 1875.

In the autumn of 1888 there was a rather fierce discussion in the pages of the "Athenæum" on the panelling in the Long Gallery at Haddon Hall. It would be too long a story to go into details here as to the points of difference raised in the course of this discussion. It will be found in the numbers of the "Athenæum" between August 25th and September 22nd, 1888.

In the BUILDERS' JOURNAL for January 28th, 1896, will be found a paper by Mr. A. T. Bolton, entitled "An Old House," which has special reference to Haddon Hall and Compton Wyniates. Three illustrations of Haddon were given.

The BUILDERS' JOURNAL had also an illustrated article on Haddon on August 29th, 1900.

Imaginative Writers.

Writers of imagination have found in Haddon Hall a native charm and a romantic story that has not been without its inspiration. But it must be confessed that achievement has fallen far short of what we might have expected of it in this direction. Of a local romance that enjoys a great sale the less said the better. But in passing it may be remarked that the whole romantic story of the wooing and flight of Dorothy Vernon will hardly bear the test of criticism. Mr. Duesbury says (and the late Duchess of Rutland quotes him with approval): "In the first place it is difficult to imagine where the ball could have been held; in the next it is not clear that the doorway and the steps leading to it existed . . . . ; and in the third place such a proceeding [as the elopement] was quite unnecessary, as Sir John Manners was in every way an eligible match, and there is not the slightest hint of any quarrel between him and his father-in-law."

Yet it is the story of Dorothy Vernon's flight that gives to Haddon its chief interest

in the eyes of too many people. Sullivan's opera of "Haddon Hall" is founded on this love-story.

It has been said that Mrs. Radcliffe was inspired by Haddon Hall in writing "The Mysteries of Udolpho." It may be so. But there is nothing in the description of the castle of Udolpho that in any way can be said to suggest the Derbyshire house.

More astonishing is the idea that connects Martindale Castle in Scott's "Peveril of the Peak" with Haddon Hall. How this confusion rose I have never been able to make out. The note relating to the arrangement of the apartments in Martindale Castle is, as Mr. Cokayne has pointed out, sheer nonsense. It occurs, it will be remembered, in the early portion of the story, and is as follows: "This peculiar collocation of apartments may be seen at Haddon Hall, Derbyshire, once a seat of the Vernons, where, in the ladies' pew in the chapel there is a sort of scuttle, which opens into the kitchen, so that the good lady could ever and anon, without much interruption of her religious duties, give an eye that the roast meat was not permitted to burn, and that the turnbroche did his duty." Such an experience at Haddon Hall is simply impossible, for the chapel is in the south-west corner and the kitchen far away on the north side. This mischievous note has been the excuse for inserting in some of the illustrated editions of the "Waverley" novels a picture of Haddon Hall as representing Martindale Castle. It is high time this note was withdrawn.

The Baroness de Calabrella's "Evenings at Haddon Hall" has little to do with the building except as regards the title. It is merely a collection of tales supposed to be told there, and written round Cattermole's plates. In reference to Mr. Charles Major's recent novel, "Dorothy Vernon of Haddon Hall," the visit of Queen Elizabeth to the house is, of course, purely imaginary, as are the "folding doors" through which the queen enters the ballroom.

In Philip Gilbert Hamerton's book of verses entitled "The Isles of Loch Awe," published in 1855, will be found a descriptive poem of some length on Haddon Hall. It is illustrated by vignettes from drawings by Mr. Hamerton. It is in this poem that the author of "The Intellectual Life," contemplating the wristlet in the Banqueting Hall, regrets that he has never experienced the pleasures of being drunk.

The contributions to the literature of Haddon that may be found in the printed proceedings of learned societies are mostly inaccessible to the average student, and generally refer more to family history and genealogies than to architectural issues. Mention, however, must be made to two papers that appeared in the Journal of the Derbyshire Archæological Society for January, 1900. One on the "Painted Windows in the Chapel of S. Nicholas, Haddon Hall," by the Rev. Charles Kerry, contains perhaps all that can be said on that subject, and is illustrated by five exceedingly good photographs. The other paper, by Mr. W. A. Carrington, of Bakewell, entitled "Haddon: the Hall, the Manor and its Lords," contains little of an architectural character, but, as the most authentic account of the Lords of Haddon that has yet appeared, cannot be passed over. It also materially adds to our knowledge of the manner in which the house was furnished in the seventeenth century.

It is hardly necessary to direct anyone how to get to Haddon Hall; but comparatively few people approaching the house from the Bakewell side know of the beauties of the old road, which brings you down upon the mansion from the hillside above. It is not a road for driving or cycling; but for pedestrians who love quietude and shade it will be found a delightful change from the hot dustiness of the great high road from Bakewell to Rowsley. Besides this, you approach Haddon in the way it was approached in ancient days, finding yourself in front of the great gateway under the north-east tower.

In conclusion, let me quote the words of Prof. Roger Smith in his handbook of Gothic architecture: "Probably nowhere in England can the growth of domestic architecture be better studied, whether we look to the alterations which took place in accommodation and arrangement, or to the changes which occurred in the architectural treatment of windows, battlements, doorways and other features, than at Haddon Hall."

A.A. PRIZE LIST, 1901-02.

A.A. travelling studentship, value £25, and silver medal, L. G. Detmar; second prize, value £5, G. S. Nicol.

A.A. medal, value £10 10s., not awarded.

Banister Fletcher bursary, value £26 5s. and medal, A. E. Richardson.

Andrew Oliver prize, value £3 3s., W. J. M. Thomasson; second prize, value £2 2s., H. Kenchington.

A.A. scholarship, value £4 4s., W. A. Hodges.

Studio, Division I.

Drawings of old work, prize value 10s. 6d., J. F. Schneider. Study of ornament, prize value 10s. 6d., H. L. Samson. Construction, prize value 10s. 6d., H. L. Samson.

Studio, Division II.

Design, prize value 10s. 6d., I. S. Davies. Time sketches, prize value 10s. 6d., A. E. Bullock. Study of ornament, prize value 10s. 6d., A. E. Bullock. Construction, prize value 10s. 6d., A. E. Bullock.

Perspective, prize value 10s. 6d., H. L. Samson.

Elementary Class of Design.

Prize value £3 3s. and bronze medal, H. L. Samson. Certificates, E. G. Stevenson and H. Hyams.

Advanced Class of Design.

Prize value £5 5s., bronze medal and pass for modelling class, E. Gunn.

Certificate and pass for modelling class, E. G. Theakston.

Passes for modelling class, L. Lee, A. G. Scott and J. N. R. Vining.

Order of Merit.

Lectures, Division I.

Greek and Roman Orders: (1) E. G. Stevenson (book prize); (2) J. T. Sifton; (3) C. R. Pinsent.

Elementary Construction: (1) W. A. Hodges (book prize); (2) H. F. Murrell; (3) H. D. Aubrey.

English Architecture: (1) C. J. Goodwin (book prize); (2) H. F. Murrell; (3) H. J. Wyeth.

Mediæval and Renaissance: (1) W. A. Hodges (book prize); (2) H. F. Murrell; (3) C. J. Goodwin.

Elementary Physics, Formulæ and Calculations: (1) R. E. Stewardson (book prize); (2) W. A. Hodges; (3) T. W. Watkins.

Plane and Solid Geometry: (1) S. T. Hennell (book prize); (2) C. R. Pinsent; (3) R. H. Greig.

Lectures, Division II.

Materials, their Nature and Application: (1) R. J. Tyndall (book prize); (2) G. Church; (3) B. B. Hooper.

Construction: (1) G. Church (book prize); (2) C. M. Crickmer; (3) A. Wood.

Drainage and Water Supply: (1) D. Anderson (book prize); (2) B. B. Hooper, B. Greig and A. Potter. (3) G. M. Page.

Ventilation, Lighting and Heating: (1) G. M. Page (book prize); (2) D. Anderson; (3) B. Drummond.

Professional Practice: (1) B. Greig; (2) B. Drummond; (3) W. J. Davies.

Mensuration, Land Surveying and Levelling: (1) D. Anderson (book prize); (2) H. J. Rippon; (3) W. H. Baines.

ORDNANCE SURVEY.

THE annual report on the Ordnance Survey presents a satisfactory record of steady progress. The old discredited 4in. map has been laid on the shelf, and, as Col. Duncan Johnston, the Director-General of the Survey, says, "there is now available to the public a 1in. outline map of the whole of the country, prepared on one uniform system and with its principal details nearly up to date." It was resolved in 1893 that the 1in. map should be revised every fifteen years. The first revision being now complete, the second has been begun "and is proceeding at a rate such that about one-fifteenth of the whole country will be revised annually." Commenting on the matter, the "Times" says: "This is certainly a vast improvement on the dilatory methods formerly adopted by the Survey, or perhaps imposed on it by a close-fisted Treasury; and, if the opportunity afforded by the revision is taken to improve some of the details in which the coloured map is still deficient, we shall in the end obtain a 1in. map to which no serious exception can be taken. The principal defects to which we refer are those of indistinctness in the printing and inconspicuousness of the contour lines. These may be inherent in the process of reproduction employed; but, if that is so, a comparison with the maps issued by the French Ministry of the Interior will show that far better processes are available."

Speaking of the coloured maps on the 1in. scale, Col. Duncan Johnston remarks: "The sale of these maps appears to be on the increase, but is still not very large. It is believed that they are appreciated, when known, but the general public seems to be unaware of their existence, although great pains have been taken to make it known by means of Press notices, leaflets, publication reports, &c." The maps are sold either through agents appointed in 116 of the principal towns of England, or through about 500 head post-offices throughout the country. The sales through the post-offices, however, which on any adequate and properly organised system ought surely to be the most numerous, "have hitherto been small, and until recently diminishing."

As the "Times" points out, the explanation is that, whereas the local agents are supplied with the maps at a discount of 33⅓ per cent., are allowed a small credit stock of the maps of the district, are allowed to exchange obsolete maps for newly revised maps whenever necessary, and are supplied with the maps free of all charge for carriage and packing, the post-offices enjoy none of these advantages. Until quite lately no single map was kept at the post-offices, so that the purchaser had to order each map as he wanted and to pay full price for it, together with 3d. additional for postage. Thus, whereas at an agent's the purchaser could see the map before he bought it, and could buy it for 10d., if the agent was content with a profit of 25 per cent., he must pay 1s. 3d. for it at the post-office, and must pay for it before he had seen it.

Col. Duncan Johnston notes: "In July, 1901, framed specimens were sent to all head post-offices in Great Britain, except those in towns at which there is an Ordnance Survey agent, and the Treasury sanctioned a reduction in the charges for posting and packing. Since this has been done, the sales, though still small, show a marked improvement, those for 1901-2 amounting to £192, against a total of £88 for the previous year."

All this is good as far as it goes, but the fact remains that "a purchaser must still pay 1s. or more at the post-office for a map which an agent can afford to sell for 10d., and so long as that is the case it seems hopeless to look for any very large extension of the sale of maps through the post-office."

New Patents.

These patents are open to opposition until October 13th.

1901.—Cranes.—15,666. T. D. HOLLICK, Mountnessing, Brentwood. The crane consists of a horizontal beam mounted on legs which run on rails and having on its underside a travelling carriage. This carriage carries a wheel around which the hoisting rope passes from another wheel at the end of the beam, and by these means the load can be lifted and carried from place to place with great ease and rapidity. All is of lattice-work steel construction.

Plaster Mouldings, Embellishments, &c.—15,772. G. B. HALL, "Valkyrie," Colney Hatch Lane, Muswell Hill, London, N. The plaster is delivered in a continuous stream between endless bands and compressed between rollers so as to produce plain, fluted or ornamental slabs, &c., which are then cut into lengths as required; or delivered to a series of moulds travelling with an endless apron.

Incandescent Gas Lighting.—17,507. C. SCOTT-SNELL, 51, Victoria Street, London, S.W. The burner has compressed air and gas-inlet jets so arranged as to get the maximum temperature and brilliancy. With a gas consumption of 15ft. per hour it is necessary to compress only 3ft. of air.

Sewage Troughs.—19,143. A. WAKEFIELD, 39, Victoria Street, Westminster, S.W. Carriers used for distributing sewage on to land are usually troughs laid in sections, one side being made lower than the other so that the sewage may overflow it. These troughs are usually made in three parts, but by this invention all is made in one piece, the channels and cheeks being integral.

Steam Pile Driving.—19,524. W. A. SISSONS, Hedon Road, York. Owing to the fall of the ram or monkey requiring to be varied as the piles are driven, holes are bored in the leaders, which requires the attendance of someone to move the staple out of one set of holes into another, as well as someone else to pull the cord for again connecting the ram to the chain. By this invention both these persons are dispensed with, as the device is automatic, a detent lever and other means being employed.

Paving Streets.—19,889. T. A. BELL, 11, Warbreck Road, Aintree, Liverpool. Instead of pitch or cement, sulphur is used as the binding agent. The setts are laid in the ordinary manner and the spaces between them are then filled with gravel: finally the liquid sulphur is poured in to bind the whole.

"Maturing" Portland Cement.—22,601, J. S. RIGBY, Bagot Street, Wavertree, Liverpool. The cement is cooled by passing it through a conveyor, and is then subjected to cold and moist carbonic acid gas and air. The free lime is thus hydrated so that the cement may be used at once, thus avoiding a long process of maturing.

The following specifications were published on Thursday last, and are open to opposition until October 20th next. A summary of the more important of them will be given next week.

1901.—16,230, DUCKWORTH, mixing apparatus. 16,486, GREENLEY & DAY, producing designs or surfaces for enamelling. 16,846, HENVIS, ventilators. 17,372, DUCKETT, ovens for kitchen ranges. 18,140, WADSWORTH, water-carts. 18,632, SMITH, formation of the socket parts of drain-pipes. 19,915, BODY, joiners' ploughs. 20,150, WHITAKER & WHITAKER & CO. LTD., seats of water-closets. 20,223, MUIRHEAD, band-sawing machines. 20,246, ALDOUS & ALDOUS, ventilating sewers. 20,390, CROSS, sewers. 21,741, KLABER, stencil sheets. 25,441, HOFFMANN, automatic fire extinguishers.

1902.—435, WRIGHT & WRIGHT, joint for sewer and other pipes. 4,849, CHADWICK, water-closet seat hinges. 11,381, O'BRIEN, ventilating machine to facilitate the ventilation of tube railroads. 11,941, HUNT, fireplaces. 12,091, SCHROEDER, window ventilators. 15,318, WAXIN, cement or artificial stone. 15,427, SPENGLER, spring hinges for doors.

Bricks and Mortar.

Aphorism for the Week.

Art, in all its forms, is bounded on one side by the practically useful and on the other by unsuccessful attempts at art.—TOLSTOY.

Our Plates. THE house near Wrotham in Kent is built on an elevated site overlooking a wide expanse of beautiful country. The proprietor has given the architects more than the usual latitude, and there is a good deal of quiet panelling within the house to give quality to the rooms, as well as other accessories that are likely to add to the comfort of the occupants. The architects are Messrs. D. B. Niven and H. Wigglesworth, F.F.R.I.B.A., of Gwydir Chambers, 104, High Holborn, W.C.—The hospital at Constantinople is now being erected for a British committee, and will be chiefly used by British sailors. The materials are Trieste stone, the roof is of Marseilles tiles, and the turrets are covered with copper The flooring throughout of the passages is marble, and that of the wards teak. The building is situated near the Galata Tower, in the old part of Constantinople. The accommodation is for fifty patients, nearly all being single-bed wards. The Sultan has granted special permission for the entrance of all materials used free of Customs duty. Mr. H. Percy Adams, who is the architect of the hospital, has had the assistance of Mr. J. Herbert Willis, of His Majesty's Office of Works, in the superintendence of the erection of the building. The cost of the building will be about £30,000. The perspective drawing which we illustrate was exhibited in this year's Royal Academy.

A City Improvement. THE Corporation of the City of London have in hand a scheme of some importance for widening Lower Thames Street, in a stretch from Botolph Lane to Fish Street Hill, which extends to Monument Square and Pudding Lane. An extensive block of premises is now in course of demolition. Lower Thames Street, which is congested with traffic, is only 18ft. wide in the part of the roadway mentioned, and it will be increased to 60ft.; and the width of Pudding Lane (7ft. 6in.) will be doubled. Old historical landmarks are fast disappearing in the City as well as in the Metropolis, and when the improvement scheme is completed and quaint old shops are supplanted by imposing commercial premises, one will hardly be able to recognize the Pudding Lane in which the Great Fire of London had its origin. The baker's shop in which the fire commenced was pulled down about fifteen years ago, and the site is covered by large commercial premises. The Monument was erected to commemorate the fire, which extended from the Tower to the Temple Church and from the north-east gate to "Pye Corner," Cock Lane, Holborn, where Macaulay states that Dr. Johnson used to go "ghost-hunting." The Monument is 202ft. high, that being the distance of its base from the spot where the fire commenced.

Brenzett Church. BRENZETT CHURCH, which has undergone restoration, was reopened recently. Situated almost in the centre of Romney Marsh, the church dates from the Norman Transition period. Belonging, in the reign of Richard I., to the Abbey of Guysnes in Flanders, it seems from historical records to have suffered in the reign of Henry VIII. during the suppression of religious houses. The church itself is dedicated to a Saxon saint and virgin, St. Eanswide, or Eanswith, who died about 650 A.D. At the present time the most interesting part is the old Fagge chapel, in which a fine monument is to be seen of two Fagges, the whole being of Welbeck marble. The church was badly in need of repair both inside and out, and the south-east buttress of the chancel was settling badly, causing the masonry of the main walls to go with it. The stone tracery of the windows has all been carefully repaired, and other stonework that was decayed with age has been replaced with new. The steeple, the most important part of the work, was found to be 2ft. 6in. out of the perpendicular, while the bell storey had to be strengthened, necessitating the reconstruction of the spire. The whole of the timbers were taken down to the plate level and a new centre-post put in, the spire being covered with new oak boarding and shingles. The interior of the edifice has been cleaned and re-decorated, while the pews have also been re-varnished, the work reflecting great credit on Mr. W. H. Bourne, of Woodchurch, and the architect, Mr. Lacey, of Ashford.

The Black Hole Monument. THE Viceroy's gift to the city of Calcutta, a monument to those who died a century and a half ago in the Black Hole in which Suraj-ud-Dowlah incarcerated his prisoners during the short while he was in possession of Calcutta before his final overthrow at Plassey, is rapidly approaching completion. The design selected is the second of the two models put up last winter for Lord Curzon's approval. It is of white marble, and the sides of the pedestal will bear suitable inscriptions of the names of those who perished in the Black Hole. The monument itself is now in position in Charnock Place, just opposite to the Custom House, at the point of junction with the road by Dalhousie Square where Writer's Buildings are situated. This is as near to the real site of the Black Hole as it is possible to get. The site itself is included in the premises of the Custom House. The monument being in position, the engraving of the tablets will take some time yet to complete. It is hoped that all will be ready for the formal opening ceremony when His Excellency arrives in Calcutta. It was to make room for this monument that Sir Ashley Eden's statue was removed and erected in a nook filched for the purpose from Dalhousie Square, but anyway an obelisk to the memory of the Black Hole was in the place before Sir Ashley's statue which replaced it, and old Holwell of Black-Hole fame, whose name is given to the new monument, is only resuming his own.

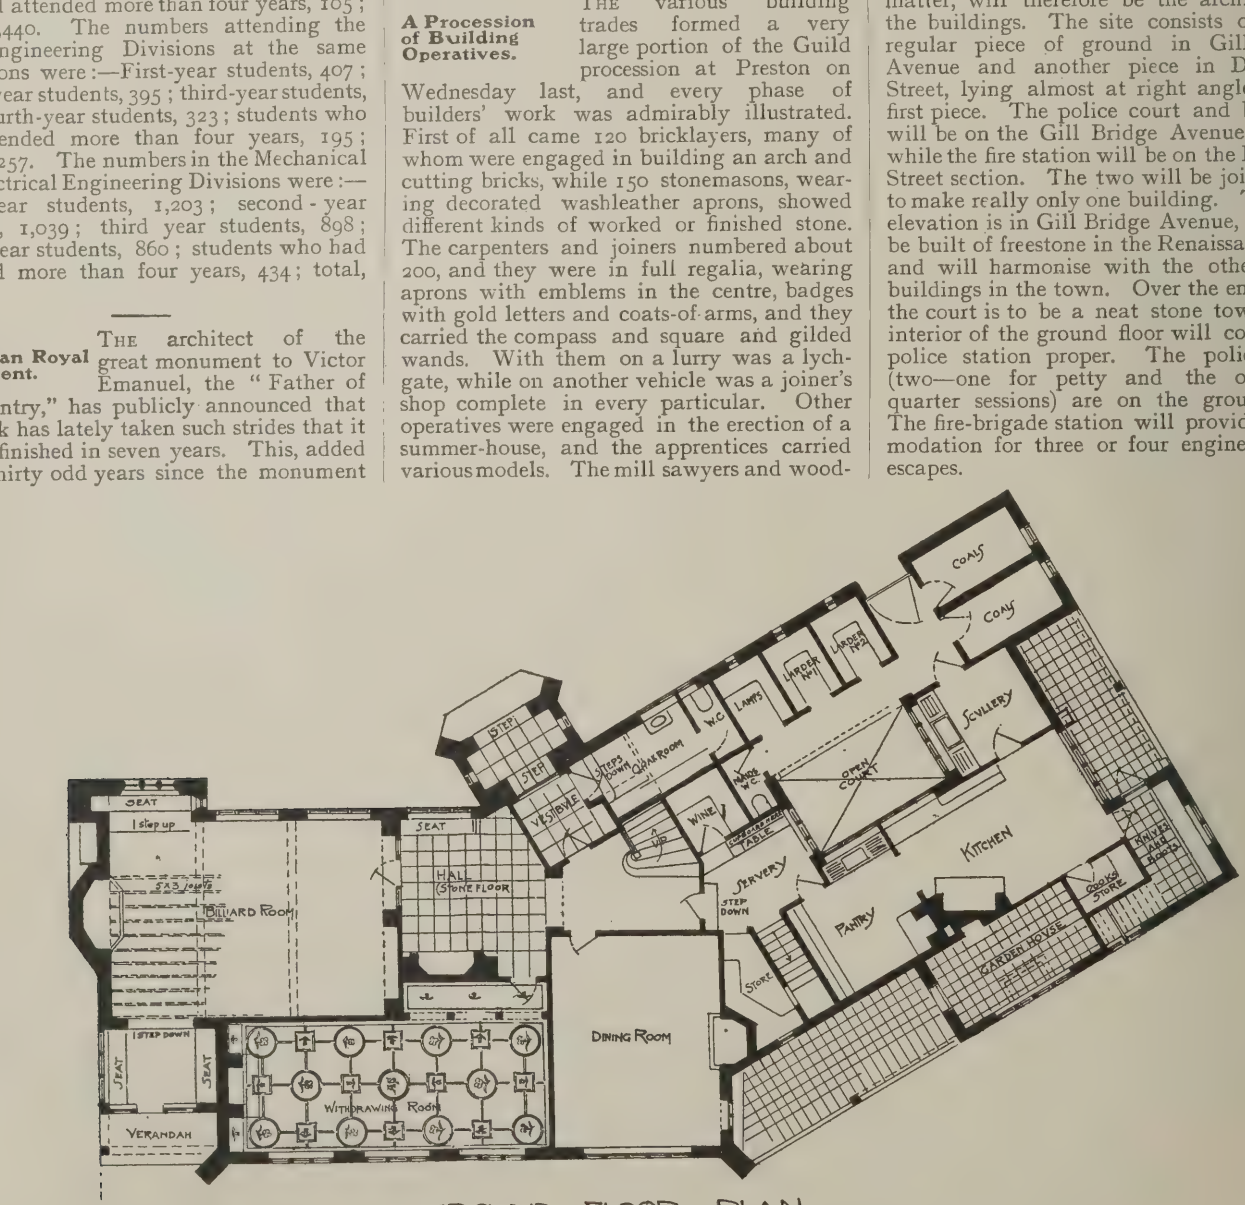
From a Book List. IN "Belinda's Book List" for last month (Hatchard's) the following appeared:—"Max Beerbohm, in criticising English architecture, once humorously said that one of the chief dangers of railway travelling near London was that the traveller putting his head out of the window might see the Crystal Palace. London architecture needs a censorship. The house in Piccadilly which needs the smallest apology architecturally is an hotel. Devonshire House is a blot. The fountain at Piccadilly Circus is another. There are exceptions. Two of the finest buildings in London I have never yet heard referred to—one is the Insurance Office at the bottom corner of St. James's Street, opposite Marlborough House, and the other is Messrs. Standens' premises, in Jermyn Street, which are modelled upon a Florentine palace." The criticism may be taken for what it is

worth. It is somewhat amusing, however, to hear Mr. Gilbert's fine work in Piccadilly Circus described as a "blot"; if nothing else did, this opinion would at least assure us that the critic knew very little about what she or he is writing.

Technical Education in Germany.

The German Ambassador has supplied the Council of the Association of Technical Institutions with additional statistics in regard to technical high schools in the German Empire. No limit of age is fixed for admission to these institutions, but the conditions of entry are such that they very rarely contain any students under eighteen years of age. This is secured in the case of matriculated students by requiring them to produce the leaving certificate which is usually obtained between the ages of eighteen and nineteen. Non-matriculated and casual students are not admitted before they are eighteen. The figures refer to the winter session 1901-2, except in the case of Dresden, where they refer to May, 1902. In the Architectural Division of the technical high schools at Aachen, Berlin, Darmstadt, Dresden, Hanover, Karlsruhe and Munich the number of first-year students was 320; second-year students, 266; third-year students, 234; fourth-year students, 196; students who had attended more than four years, 105; total, 1,440. The numbers attending the Civil Engineering Divisions at the same institutions were:—First-year students, 407; second-year students, 395; third-year students, 321; fourth-year students, 323; students who had attended more than four years, 195; total, 2,257. The numbers in the Mechanical and Electrical Engineering Divisions were:—First-year students, 1,203; second-year students, 1,039; third year students, 898; fourth-year students, 860; students who had attended more than four years, 434; total, 5,503.

An Italian Royal Monument.



The architect of the great monument to Victor Emanuel, the "Father of his Country," has publicly announced that the work has lately taken such strides that it will be finished in seven years. This, added to the thirty odd years since the monument was begun, seems a great time to modern ideas, especially as the money was forthcoming from the first. The new monument stands at the extreme end of the historic Corso, which before closed in a medley of odd buildings. Many of these have already been torn down to make the necessary space, and others are in process of demolition, so that the colossal monument will have in front the stretch of the Corso to the Piazza del Popolo on one hand, the Capital and the church of the Are Cœli, with the majestic sweep of steps, and on the other Trajan's Forum, with its unrivalled storm-beaten colums and the twin churches at its northern end. The monument will be a grandiose building of porticoes, Corinthian columns, statues and bas-reliefs, which will house two or more museums, and perhaps a library, surmounted by a magnificent triumphal group of horses and chariot driven by Victory—the whole rising about 290ft. In front, standing well out from the building, on its own pedestal, and approached by steps, will be an equestrian statue of the Re Galantuomo. The taste of the whole has by some critics been seriously questioned, if not condemned; but no one can deny that the effect at the end of the Corso, the centre of the life of the city, will be very grandiose.

A Procession of Building Operatives.

The various building trades formed a very large portion of the Guild procession at Preston on Wednesday last, and every phase of builders' work was admirably illustrated. First of all came 120 bricklayers, many of whom were engaged in building an arch and cutting bricks, while 150 stonemasons, wearing decorated washleather aprons, showed different kinds of worked or finished stone. The carpenters and joiners numbered about 200, and they were in full regalia, wearing aprons with emblems in the centre, badges with gold letters and coats-of-arms, and they carried the compass and square and gilded wands. With them on a lurry was a lych-gate, while on another vehicle was a joiner's shop complete in every particular. Other operatives were engaged in the erection of a summer-house, and the apprentices carried various models. The mill sawyers and wood-turners, the flaggers and slaters, the plasterers and plumbers, the house painters and decorators, all made a brave show with their lorries, which carried special models of their work, in addition to forming means of progression for those who were engaged in business operations. The engineering section was of exceptional length, the magnitude of the operations attracting attention by their interesting diversity.

Sunderland Competition.

The Sunderland Corporation having offered premiums of £100, £50 and £25 for plans for the new police station and fire brigade buildings they intend to erect, they received twenty-five competitive plans. Mr. J. S. Gibson, F.R.I.B.A., was appointed by the president of the Royal Institute of British Architects to adjudicate these plans at the request of the Corporation, and his award has resulted as follows:—£100 premium, Messrs. W. & T. R. Milburn of Sunderland, associated with Messrs. Wills & Anderson, London; £50 premium, Messrs. Stones & Stones, Blackburn, associated with Messrs. Edwards & Sproat, Glasgow; £25 premium, Mr. Alfred E. Corbett, of Manchester. Messrs. W. & T. R. Milburn, and the London firm with whom they are associated in this matter, will therefore be the architects for the buildings. The site consists of an irregular piece of ground in Gill Bridge Avenue and another piece in Dun Cow Street, lying almost at right angles to the first piece. The police court and buildings will be on the Gill Bridge Avenue portion, while the fire station will be on the Dun Cow Street section. The two will be joined so as to make really only one building. The main elevation is in Gill Bridge Avenue, and will be built of freestone in the Renaissance style, and will harmonise with the other public buildings in the town. Over the entrance to the court is to be a neat stone tower. The interior of the ground floor will contain the police station proper. The police courts (two—one for petty and the other for quarter sessions) are on the ground floor. The fire-brigade station will provide accommodation for three or four engines and fire escapes.

Keystones.

The Bells of St. Paul's Church, Wooburn, Bucks, have been thoroughly restored as a memorial of the Coronation.

A New Wesleyan Church at Helmsley has been erected partly on the site of the old structure at the cost of about £2,000. It accommodates 330 persons. The architects were Messrs. Hornsey & Monkman, of York.

A New Hospital for Infectious Diseases is to be erected at Portsoy from designs by Mr. William Kelly, architect, of Aberdeen. The site of the hospital is to the west of Portsoy, on ground presented by the Countess of Seafield, facing the south on a gentle slope falling to the sea. The hospital will provide accommodation for twenty patients.

Norman Work at Chatham.—It has been found impossible, after all, to preserve all the old Norman work at St. Mary's Church, Chatham, the nave of which is being rebuilt, owing to the decayed condition of the masonry. The centre arch has been taken down, but its columns are to be reconstructed of the old Norman material. The two beautiful Norman side arches will remain intact.

A New Chancel to the Parish Church of Richmond is to be erected as a memorial to the late vicar, Canon Proctor. It is well known that he had set his heart on this improvement, in addition to a chancel screen and rood, and he collected over £3,000 for the purpose. The proposal to erect a screen met with some opposition, a faculty was refused, and the matter was in abeyance at the time of Canon Proctor's death. It is now suggested by the architect who has been consulted, Mr. Bodley, R.A., that a larger and more commodious chancel should be built, with aisles and vestries, at a cost of £7,000, by which the accommodation of the church would be increased.

India's Consulting Architect.—The object of creating the new appointment of consulting architect to the Government of India is to place at the disposal of both imperial and provincial authorities the expert advice not only of an architect but of an artist in connection with the construction of public buildings. Under present circumstances, either a public building is run upon lines of economy, and not of beauty, by the Public Works Department, whose officers are engineers and do not profess to be architects, or if the building is of a special kind the design of the façade is sometimes thrown open to outside competition with no other inducement than a prize of a very few thousand rupees for the winner. A beautiful building is not always necessarily more costly than an ugly one.

Palestine Exploration.—Mr. J. D. Crace, hon. secretary, writes: "The excavations at Gezer by the Palestine Exploration Fund, recently begun under Mr. Stuart Macalister, are already yielding important results. A portion of the city wall, of very ancient character, was found within the first few days; and since then a discovery has been made which carries back the history of the site to a remote antiquity. This is a cave, artificially cut, about 30ft. long, made to serve as a crematorium, with a chimney cut in the rock. The floor is thickly overlaid with calcined human bones. Above this stratum of cremated remains are unburnt remains of later interment, the bodies having been buried in the contracted position. Pottery, much of it perfect, occurs largely in both strata. Professor Alexander Macalister, of Cambridge, as an anthropologist, holds the opinion, confirmed by the finds of pottery, that the remains belong to two distinct races, both pre-Israelite."

The Town Hall, Batley, was destroyed by fire last week. It was an old building, and the Council have been considering plans for the erection of a new Town Hall.

A New Reredos at Wotton-under-Edge Church, Gloucestershire, has been erected. It is constructed of English oak, and the detail is of fourteenth-century character. It has been executed by Mr. H. C. Frith, of Gloucester, under the immediate supervision of the architect, Mr. Walter B. Wood, of Gloucester.

The Chancel of St. Stephen's, Clewer, near Windsor, is being decorated. The work is now completed, with the exception of new paintings which are to replace the mosaics on the east wall and the canopies over them. The chancel was the first portion of the church to be built, and it was completed in 1871. The internal decoration has cost considerably over £1,000. Two windows—to St. Edith and St. Chad—have been placed in the south aisle.

Crewe Municipal Buildings' Competition.—Forty-five sets of competitive designs for new municipal buildings were received. Messrs. Woodhouse & Willoughby, of Manchester, were the assessors, and on their recommendation the first prize has been awarded to Mr. Henry T. Hare, F.R.I.B.A., London. The second prize has been divided between Mr. Albert Dixon, of Leeds; Messrs. Banister, Fletcher & Sons, of London; and Rodney & Denning, of Bristol. The estimated cost of the new buildings is £14,000.

The New Rose Window in Westminster Abbey, in the south transept, was completed before the Coronation as a memorial to the late Duke of Westminster, but has escaped general notice. The cost has been covered by a public subscription, which amounted to nearly £2,400. The general subject is "The preparation of the world for Christ's coming," and there are twelve lower lights representing the early Christian preachers and martyrs. The design is by Mr. G. F. Bodley, R.A., and the colours chosen are much lighter than those of the old window in the south transept, in order to improve the illumination of the Poets' Corner.

Municipal Dwellings in St. Pancras.—At the St. Pancras Borough Council meeting last week it was reported that a loan of £25,436 had been sought from the London County Council for the purpose of defraying the cost of providing housing accommodation on the Great College Street site for persons displaced by the St. Pancras (Brantome Place and Prospect Terrace) improvement schemes. A tender to erect the block of artizans' dwellings, amounting to £17,734, had been accepted, and building operations were actually commenced. This will be the first block of industrial dwellings erected in the borough under the Housing of the Working Classes Act. The scheme, of which it forms part, was originated thirteen years ago.

A Discovery of Prehistoric Remains has been made at the fishing village of Ambleteuse, near Calais, by Professor Dharvent, of the Anthropological Society of Paris. In connection with works of sea-defence the removal of sand on the dunes at Ambleteuse was being carried out to a depth of 20ft., and this revealed the presence of an ancient soil with many evidences of prehistoric man. Further excavation under Professor Dharvent proves this to be one of the most important neolithic stations yet discovered. It is more than 150yds. square, and includes what was undoubtedly a large workshop for the making of flint swords, knives, arrow and javelin heads, &c., numbers of which were found.

Mr. C. H. Brodie (who has recently removed his office to 15, Hart Street) has been appointed surveyor to the National Provincial Bank of England, Ltd.

Mr. W. B. Gwyther, F.R.I.B.A., of the Public Works Department, Bengal Secretariat, Calcutta, has been appointed a Commissioner of the town, and also a member of the general committee of the Corporation.

American Translation.—The Fairbanks Company, of 78-80, City Road, London, E.C., has issued a booklet giving a number of tables for converting American dollars into English pounds, ranging from 1 cent. to 5,000 dollars. In addition it gives a few tables of the metric system and some rules for converting into English measures and weights. The price of this useful little book is 6d.

A New Wesleyan School at Rodborne is being erected in Telford Road at a cost of about £500. Messrs. Tydeman Brothers are the builders, and Mr. G. Davies is the architect. It is 40ft. by 30ft., of Gothic design, with cathedral glass leaded lights. The interior walls will be stuccoed, and the roof constructed of clean white varnished deal. Seating accommodation is provided for about 200 scholars. There are also large and small vestries.

A.A. New Premises Fund.—The following are additional donations to the Architectural Association New Premises Fund:—

	£	s.	d.
Amounts already announced -	4,318	6	6
W. E. Davis - - - -	5	5	0
A. Wingate - - - -	2	10	0
Zeph. King - - - -	2	2	0
J. J. Cotten - - - -	1	1	0
R. Hosking - - - -	1	1	0
	£4,330	5	6

A New Chapel and Schools at Radstock has been erected for the Wesleyan Methodists at a cost of over £5,000. The building, which consists of a nave with aisles on each side, is 59ft. 9in. by 37ft. 3in. There is a choir at the back raised above the nave, and in front is a spacious rostrum. A gallery surrounds the buildings, supported by iron columns. The roof is in one span, rising to a height of 30ft. 6in. Seating accommodation is provided for 280 persons in the body of the chapel and 256 in the gallery.

An Act to Prevent the Defacement of Scenery was passed in the last session of the Prussian Landtag. It runs as follows: "With the object of preventing the disfigurement of places remarkable for their natural beauty, the police authorities are empowered to prohibit outside of towns such advertising boards or notices or pictorial devices as disfigure the landscape by means of police regulations issued in accordance with the law of July 30th, 1883. Such regulations may apply to particular areas or spots."

At Conway Workhouse a number of alterations and additions have been carried out at a cost of about £4,500. The architect was Mr. T. B. Farrington. A new dining-hall has been erected on the site of the old hall, and provides seating accommodation for 100 persons. A new board-room has been constructed over the new dining-hall. The ventilation has been carried out by Messrs. James Stott & Co., Oldham, and the furnishing by Messrs. Rhydwen Jones & Davies, Llandudno. A new laundry has also been constructed, and is divided into four departments, namely, receiving-room, washhouse, ironing-room and delivery-room. The contract has been satisfactorily carried out by Messrs. David Jones & Hughes, contractors, Conway and Llandudno, under the supervision of Mr. T. B. Farrington, A.M.I.C.E., Trinity Square, Llandudno.

A New Institute at Newborough, Anglesey, is being erected to fulfil the purpose of a library, village club and meeting place, and also should provide accommodation in which the aged people of the parish might spend their closing days. Mr. Rowland Lloyd Jones, of Carnarvon, is the architect. The site is on the road from Newborough to Gaerwen, and the institute will front the Menai Straits. Comprising some 26,000 sq. yds., the site will have three cottages or almshouses on each side. The quadrangle in front will be laid out as a garden. From the ground floor to the first floor the institute is to be of grey Anglesey granite, with dressings of Ruabon stone, and the upper part is treated in half timber, with two gables divided by a clock tower over the entrance-hall, which will be of granite to the domed roof, which, with the finial, will be of copper. On the ground floor, to the left of the vestibule, is the library, and on the right a smoking-room and a coffee-room. Over the libary is an assembly-hall of similar dimensions, and over the coffee-room a reading-room. All the necessary offices, such as kitchens, cloak-rooms, and committee-rooms, are provided.

Builders' Notes.

The late Mr. William Griffiths, of St. Martin's, Salop, retired timber merchant, left an estate valued at £22,000 odd.

Builders and the King.—At the half-yearly meeting of the Midland Centre of the National Federation of Building Trade Employers recently held in Birmingham, under the presidency of Mr. William Sapcote, a message of sympathy with his Majesty in his serious illness was sent. To this a reply has been received from Mr. Akers-Douglas stating that he laid the message before the King. His Majesty was pleased to receive the same very graciously.

R. Waygood & Co., Ltd., and the Otis Elevator Co., Ltd.—A consolidation of these two companies has been effected, and the joint business will in future be carried on under the title of Waygood & Otis, Ltd. The name of Waygood has been associated with the best quality of hydraulic lift and hoist work for the last half century; while to the Otis Company attaches the credit of having introduced and popularised the electric lift in Great Britain. The major portion of the lift business in this country has been carried out by these two firms, and the more responsible and exacting class of work, such as installations in the royal palaces, Government offices, public institutions and leading hotels, has been almost entirely entrusted to one or other of them. The consideration which appears to have determined the directors and shareholders of both companies in favour of fusion of the two businesses is that each party is able to supplement the other in important respects, the Waygood Company possessing excellent manufacturing facilities, while the Otis Company controls for the British Empire and Europe the patents, designs and wide experience of the Otis Elevator Co. of U.S.A. The British and American Otis companies are quite distinct organisations, possessing only the name in common; but the British company is not only the proprietor of the American company's patents in its territories, but has the immense resources of the latter at its back. Mr. H. C. Walker, chairman and managing director of R. Waygood & Co., will be chairman of the new company, and together with Mr. R. Percy Sellon, M.I.E.E., managing director of the Otis Elevator Co., Ltd., will act as joint managing director of Waygood & Otis, Ltd.

A Serious Accident occurred last week at Tunbridge Wells, resulting in the death of one man and injuries to four others. The men were plastering the roof of the New Opera House on Mount Pleasant, and they fell a distance of 40ft. to the floor owing to a plank giving way. A stonemason, named Murrell, was killed on the spot, and the four others were so badly injured as to necessitate their removal to the hospital, where two of them lie in a precarious condition.

New Building Regulations in Calcutta are now coming into force, but these will require for their proper working something more than a mere amateur knowledge of the subjects involved, as at present available among the responsible officers of the Corporation. The deputy chairman controls the building department at present, but his knowledge of the matter may be regarded as purely official and pertaining to his office. The practice of course grew up under the old system, when all kind of power was reserved for the officers who had been hoisted into office by their respective cliques. Under the new system there is at least recognition of such anomalies, and no one under the rank of chairman is allowed to be omniscient. By the new regulations, a building surveyor is to be appointed (at a salary of Rs. 700 to Rs. 1,000 per month), whose duty it will be to see to the proper carrying-out of the building regulations, combined with the position of city architect.

A Fire Test with Hollow Concrete Blocks made by Messrs J. Wright & Co. was recently undertaken at the company's premises at New Malden, Surrey. The blocks were 4¼in. thick, and were built in the form of a flue, 5ft. high at the back and about 3ft. high at the front and ends. This was filled with dried timber, and two quarts of paraffin were poured on the wood to add to its inflammability; while the continuous hollow spaces in the blocks were filled with water. The test lasted three-quarters of an hour, and resulted as follows:—The outside temperature of the walls was not perceptibly increased, although the water inside was boiling. No sign of calcination of the blocks either inside or out had taken place, nor had the cement joints which held the blocks together suffered. As a further test, whilst the inside of the well was a glowing mass of fire, a stream of cold water was played from a hose without any damage whatever resulting to the blocks. The blocks, although kept filled with water, only showed, on the outside, a moisture which did not extend beyond the walls, so that little or no damage would have been done to any stock which might have been lying against the other side of such a partition.

Maple Floors in Buildings: A Fire and its Results.—A large building of slow-burning construction was partly burned a short time ago in Pittsburgh. The floors, which were of heavy timbers, covered with 3in. pine planks, and this with 1in. maple flooring, resisted the flames very well, but the water thrown on the fire swelled the maple flooring so much as to push out the brick walls several inches. It seems that in some of the floors the maple flooring was simply lifted in ridges from the planking by the effect of the water; but, in certain storeys, where a heavy load of boxes of glass prevented the boards from buckling upwards, the whole movement was lateral. "Architects will reason from this occurrence," says the "American Architect," "that maple upper floors in warehouses, if of large extent, ought not to be too dry before laying. In most cases kiln-drying is avoided under such circumstances, but it is important to keep the floors tight, and these boards, if not kiln-dried, seem to have been laid with very close joints. It may be observed that many architects who use the slow-burning construction pitch their floors slightly, and provide outlets by which water thrown upon them to extinguish fire may escape without soaking the boards; and if, as is sometimes done, a little gutter is contrived in the flooring at the two sides of the building parallel with the floor-boards, the swelling of the latter will not affect the walls."

Accident caused by Cradle.—A serious accident happened at the German Embassy, No. 9, Carlton House Terrace, last week, in which a workman named Alfred Weaver was badly injured. The Embassy is undergoing redecoration, and Weaver, a painter, was working from a swinging platform when the rope gave way, and the man fell a distance of about 25ft. into the basement below. He was picked up and conveyed to the Charing Cross Hospital suffering from a broken arm and a number of cuts and bruises about his head, body and face.

International Fire Exhibition, 1903.—In order to assure the international character of the International Fire Exhibition at Earl's Court next year the British Fire Prevention Committee has arranged with its foreign corresponding members for the formation of local committees in the countries principally interested in the question of fire protection. Arrangements have been made that the acting secretary will be in attendance daily from 11 to 1 at the offices of the Committee, 1, Waterloo Place, to which all enquiries should be directed. Among the many foreign representatives who will co-operate in the exhibition are Professor Berger, city architect of Vienna; M. Louis Bonnier, architect to the city of Paris; Herr Hinckeldeyn, principal Director of Public Works in Germany; Von der Hude, president of the Society of Architects, Berlin; Count Paul de Suzor, city architect of St. Petersburg; and M. Kuttner, vice-president of the Russian Imperial Institute of Architects.

St. Owen's (Hereford) Improvement Scheme: A Lively Dispute.—The Corporation of Hereford has built a number of workmen's dwellings at St. Owen's, and in connection with these a lively dispute has been in progress between the Hereford Master-Builders' Association and the city surveyor (Mr. John Parker). Acting on instructions from the Association, Messrs. James Brooks, Son & Godsell, the well-known firm of architects, made a report on the cottages in which, among other things, they say that the drawings, specifications and quantities have not been adhered to, and that the work has been unsatisfactorily carried out. "It matters little what the actual cost of carrying out the work may be, because the amount that will ultimately be required to be expended on repairs will be wholly out of proportion to the income derived from the property, and in a few years the houses will be little better than the hovels that were pulled down to make place for the present buildings." They then go on to enumerate and deal with the matters in detail. In reply to these charges Mr. Parker states: "I presume the object of the report is to show that such deviations have been made from the original specification and quantities supplied to the builders as to account for the difference of some £1,000 between the lowest Hereford tender and the actual cost of the work. Even supposing such a view of the position possible, I fail to see that the Association or any firm of architects have any right to dictate to the Council how their business should be conducted; but, in compliance with the desire expressed, I am pleased to have this opportunity of refuting statements which might injuriously affect my official and professional position in the city." Mr. Parker then at considerable length goes into the details of the various charges, contradicting or explaining them, but we have not the space to give these details.

A FOUNDATION ON QUICKSAND.*

By C. A. LEARNED.

MERIDEN lies in a valley between high hills. In the valley, which is claimed by some to be the original bed of the Connecticut River, is a soil which consists of a sandy loam, a little gravel and plenty of quicksand. Most of the buildings in this valley rest on the skin which is found at various depths below the surface, and here the Meriden Gaslight Co. bought a 300ft. by 500ft. meadow-lot adjoining its works on which to erect a new holder. Careful borings were made over a section 120ft. wide by 250ft. long to determine the thickness of the gravel, if any, and its distance below the surface. About seventy-five tests were taken and the result laid out and plotted into curves, so that the most desirable place for the site might be determined. The top material was a sandy loam; the next, a good gravel, but very thin; below that, a quicksand of unknown depth. At a few points the gravel, was found as near as 2ft. to the surface and 2ft. thick, while at the others it was 8ft. 5in. deep and only 4in. thick, shading off to nothing. The average depth, however, taken from the boring-stations was 5ft. 5in. deep and 1ft. 2in. thick. A boring of 50ft. taken in the centre of the site showed 42ft. of quicksand and still more below.

On such materials it was decided to construct the foundation and erect a steel tank-holder, to be 115ft. in diameter and 103ft. high, holding 700,000ft. of gas in three lifts; the weight of the holder to be 475 tons, and the weight of the water to be 8,625 tons, or a total of 9,100 tons.

As the work of excavating progressed and the gravel was exposed, there was found a clearly-defined depression diagonally across the pit. Through this depression the gravel was very thin, and in three places the quicksand was entirely exposed—the first, a space 10ft. by 15ft.; the second, a space 4ft. by 12ft.; the third, a space 3ft. by 15ft.

Hardly had the whole of the loam been removed when rain came, overflowing the meadow and deluging the pit. This convinced the company more than ever that in erecting a holder it would be advisable to make the top of the foundation above high-water mark, which, in this case, would mean a fill in some spots of 12ft. with an average of 8ft., and the steel tank would be 2ft. 5in. above the level of the meadow.

At this point a difficult problem was confronted. Meriden topographically is on high hills and in a sandy valley; good gravel is a very scarce article. Four miles away, on the line of the railroad, is a large poor gravel bank, and two miles in another direction is a small good bank; but with all the teams that could be procured it was not possible to haul the material as fast as it was needed; and it was expensive—4s. 2d. per yd. delivered. It was evident that other and good material must be obtained in large quantities. On the line of the railroad three miles away is a large trap-rock quarry. Refuse in the shape of ironstone, soft-rock and some dirt is accumulated in large quantities. It was believed this stone would mix well with the material which was on hand, and could be purchased after it had been passed through the crusher to a 1½in. size at 2s. 6d. per yd. delivered, and in quantities up to 150yds per day. About 50yds. of gravel and 50yds. of clean sharp sand could also be procured each day, and as much ashes from the works as there were teams to put on it.

The question of piling was considered, and by some might seem the only wise plan under the circumstances, but after consulting the leading local builder, who had worked on this quicksand for thirty years and had erected some very heavy factory-buildings on it, it was thought best to put in a combination filling of the above-named materials.

The quicksand is found hard packed and not easily dug, unless water is allowed to mix freely with it. Although the excavation was in places much below the level of the adjoining brook, little water was encountered, and quite as much came from the land as from the brook side. By keeping the bare spots well drained the men could work on the quicksand with a degree of ease without sinking in very deep; the less it was disturbed, however, the better off they were. Over these bare spots it was decided to lay planks close together lengthways of the holes, and upon these 8in. by 10in. timbers, 8in. apart, crossways of the holes. The filling between the timbers was of pieces of bricks and old retorts broken up fine, that being the best material at hand just then. One of the bare spots being narrow and long, the surface was covered with large flat stones, the smaller spaces being filled in with firebricks and coarse ashes.

While working at this low level a pump was run night and day; also from these quicksand spots a 4in. tile drain was laid to a central point to facilitate drainage and keep the mass from becoming spongy while the tamping was going on and each course of filling was laid.

Until the whole surface approached a level no roller could be used, but everything put in was thoroughly rammed and sprinkled. The layers were about 3in. thick over the whole surface. When the valleys were evened up a two-horse 4,000lb. roller was put on, and as the thickness became greater this roller was increased in weight to 6,500lbs., requiring four horses. When the level of filling had been raised above the natural water-level the pumping was dispensed with over night, allowing the foundation to be saturated, but it was pumped out again in the morning.

Near the centre of the foundation a loose brick well was built up, into which the water ran as the foundation was successively wetted, and from which it was pumped to the brook. There were some high knolls of gravel not more than 3ft. below the surface. It was thought at first that the 5ft. concrete side-wall foundation might rest on these, but further consideration convinced the company that this was not advisable, as part of the foundation would rest on natural gravel, while most of it would be on filled ground, so the whole level was raised 1ft. to allow of the same kind of cushion underneath the whole structure before the 5ft. circle was started.

The layers spread each day over a diameter of 125ft. were about as follows:—125yds. of quarry refuse, 40yds. of good gravel, 50yds. of works' ashes. Towards the end of the work the ashes were exhausted. Near by was a bank of 500yds. of sand, and from this was taken what was needed to make the top-dressing under the concrete, spreading on the stone, washing it in and carefully rolling. Towards the end the roller worked night and day.

Near the edge where the wall of concrete was laid there was a space that could not be rolled, but had to be filled and tamped to a depth of 4ft. In order to make sure that this portion was as solid as the centre, a round tapering bar 5ft. long was driven into the main foundation several times. Seventy blows on the average were required to drive it 4ft. 5in., and the outside ring was tamped until it equalled the above test.

The amount of material removed approximated 2,900yds. The work of excavating and filling ready to begin concreting took twenty-two days, and six days more were required to fill-in around the great circle after the concrete wall was 4ft. high. This, however, did not delay the concreters in their work. The filling was in the following amounts:—Quarry stone or refuse, 1,780yds.; gravel, 680yds.; sand, 310yds.; ashes, 1,100yds.; total, 3,870yds.

On this foundation were laid 630yds. of Portland-cement concrete in the following proportions:—1 of cement, 2½ of sand and 5 of stone. The size of stone was 1¼in. and smaller. A great circle of concrete 4ft. wide and 1ft. thick was laid 5ft. below the finished top. On this circle was laid a ring 3ft. wide at the bottom, tapering to 2ft. 9in. wide at the top, and 3ft. high; resting on the ring was laid, over the whole diameter of 118ft., a layer 1ft. thick, trued to perfect level and plastered smooth. This work was accomplished in eighteen days, and in a most satisfactory manner, a local engineer taking the job at 20s. 6d. per cub. yd. laid. As soon as the foundation was ready the ironmen were on the ground, and the holder was erected complete in a week less than the specified time of four months.

In order to prevent the action of the brook eating away the bank near the holder, a stone wall 7ft. high was built to the level of the holder foundation and 400ft. long, protecting also a new purifier building near the brook. City water was used to fill the tank, as the brook water contained acids. It took three and a half days to fill the tank, which holds a little over 2,000,000 gallons. Before the water was put in careful levels were taken on eight points of the foundations. After filling levels were again taken, and there was not the slighest settlement.

*Extracts from a paper read before the New England Association of Gas Engineers.

TRADES TRAINING SCHOOLS.

WE have received a copy of the report of the judges on the work done at the trades' training schools of the Worshipful Companies of Carpenters, Joiners, Painter Stainers, Plaisterers, Tylers and Bricklayers, and Wheelwrights at 153, Great Titchfield Street, W. The director of the school, Mr. H. Phillips Fletcher, F.R.I.B.A., F.S.I., A.M.I.C.E., states that the classes in carpentry, masonwork and painting are in a flourishing condition, especially the first; while the classes in joinery and brickwork also show considerable improvement; the classes in plastering, plumbing, smithwork and woodcarving are, however, rather meagre and disappointing. With regard to the plastering class, it is hoped that the appointment of Mr. William Millar as instructor for the coming session will put it on a more successful basis. In concluding his report, Mr. Fletcher says:—

We have not quite so many students as last session, but, on the whole, the work executed is distinctly satisfactory. Fluctuation in numbers is always bound to take place. It is to be regretted that the companies cannot see their way to light their shops with electricity. We have no machinery or lathes in the school at all, with the exception of the smiths' motor. The committee will have to seriously consider these points in the future. A pattern-making shop and a shop for teaching students wiring for electric installations in houses might be added to the school, if the committee can see their way to do so.

Over 2,000 craftsmen have passed through the school since it was established, and one frequently meets old students on building operations as foremen, and in other advanced positions, which testifies to the good wrought by the companies in their work. The companies are much indebted to Prof. T. Roger Smith, who is chairman of the school. His advice and interest, so quietly given, are of the very greatest assistance. Architects' pupils are admitted to the various classes provided there is sufficient room.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Roof for Dye-House.

MACCLESFIELD.—A. C. writes: "In a cotton or calico dye-house is any advantage to be gained by having the roof boarded and felted over the spars? Should the timbers for a dye-house roof be painted? In a dye-house (calico) which I have just constructed the roof as far as the skylights and over the louvres is boarded and felted to prevent condensation and keep dirt from falling on the cloth. The whole of the woodwork has been painted to preserve the woodwork from the action of the steam. A calico printer and dyer said the painting, boarding and felting was all a farce."

When a roof is boarded and felted the interior of the building is less liable to changes of temperature from external fluctuations, so that in the winter there would be less condensation of steam upon the underside of a dye-house roof. When timber is well-seasoned painting preserves it from the effects of moisture, but if not previously well-seasoned painting will hasten the decay. If the roof is constructed exactly as shown in your sketch (not reproduced) it is rather a curiosity, being apparently a Queen-post truss without straining beam or struts, and the Queen posts carried up to form the side frame of a high louvre, while the truss finishes on one side 6ft. from the end of tie-beam, the remaining space being occupied by a glass slope. HENRY ADAMS.

Monier System of Building.

BIRMINGHAM.—F. H. T. writes: "What is the Monier system of building as used in the new Postal Savings Bank Buildings at Amsterdam?"

The Monier system consists of rolled joists, old rails or other ironwork embedded in concrete foundations for the purpose of spreading them over a sufficient area without requiring to go very deep to obtain the strength necessary to carry the load. For instance, a concrete raft for a warehouse may be 2ft. to 3ft. thick on the Monier system with a better result than 4ft. to 6ft. of plain concrete would give. The Hennebique system is the embedding of round iron rods or other sections in concrete walls, pillars and piles in order to increase the strength. Ferro-concrete and armoured concrete are other terms for similar construction. HENRY ADAMS.

Material for Column.

WHITBY.—COLUMN writes: "I require some columns, about 15ft. long, to carry about 10 tons. I propose to use steel as being more reliable than cast-iron. For appearance sake the diameter should be 9in. or 10in. I expect solid rolled steel would be high in cost. Would drawn steel be trustworthy, and (approximately) how would it compare for cost with cast-iron? Or would built steel be better, considering that in the latter cases they would have to be wire-lathed and formed into circular plaster columns?"

For a column 15ft. high to carry 10 tons cast-iron is quite trustworthy, and if made 9in. diameter should be, say, ½in. thick, when it would carry 15 tons safely. It would, however, not be desirable to make it less than ½in. thick, owing to contingencies in casting. Cast, rolled or drawn steel would be very much more expensive. A built-up steel column would cost about twice as much as a cast-iron one, excluding cost of pattern. HENRY ADAMS.

Syllabus of S.K. Building Construction Examination.

LEICESTER.—STUDENT writes: "Where can I get a syllabus of the Board of Education's Building Construction Examination?"

From Messrs. Eyre & Spottiswoode, East Harding Street, Fetter Lane, E.C., price 1½d. post free. G. A. T. M.

Forming Connection with Drain.

BOLTON.—S. T. writes: "My client desires to erect a house on some land—the road to it is not sewered—and to put in a temporary drain will be £46. A friend of my client's has built a house adjoining the land of my client and put in a 6in. temporary drain for his house. I have asked the local authorities to allow my client to connect up to this temporary drain, but they refuse. Can they prevent us making a connection?"

The local sanitary authority appear to have good and reasonable grounds for refusing permission to connect your drain with the temporary drain constructed by your neighbour. T. E. C.

On Becoming an Architect.

WEST HAMPSTEAD.—H. W. writes: "Kindly give me some advice as to getting a place in an architect's office. I have obtained two certificates in the building construction examinations (Board of Education), one first-class elementary and one second-class advanced stage. Would these fit me for a situation? What other subjects should I study? Is the payment of a premium necessary for obtaining a good start, and which is the best medium through which to obtain a berth?"

The certificates from South Kensington are of slight value in the obtaining of a situation in an architect's or builder's office. To obtain a thorough practical knowledge of architectural practice, it is necessary to become a premiated pupil in an architect's office, and go through a course of study such as that at the Architectural Association Day and Evening Schools. We advise you to obtain from the secretary of the Architectural Association, 56, Great Marlborough Street, W., the curriculum, which gives full particulars of the classes and the subjects necessary to study and text-books therefor.

Ownership of Plans: and Percentage for Work not carried out.

CHESTERFIELD.—F. E. T. writes: "An architect prepares plans, specifications and bills of quantities for a certain number of houses. His client, however, does not feel disposed to proceed with the work. The architect therefore sends in his bill, and the client is prepared to pay it on condition he has the plans, specifications and bills of quantities in his possession. What percentage can be charged on the bills of quantities on account of the building not being proceeded with?"

If no special agreement has been made to let the client have the plans, &c., the architect is entitled to retain them, for he ordinarily contracts only to carry out the building for the client, and the failure to complete the contract is the client's and not the architect's, and the former must therefore stand to the loss. A client only hires the services of a professional man, and does not purchase outright the private knowledge contained in his notes, *i.e.*, specifications, plans, &c. (his stock-in-trade), but merely the product of it; in the case of an architect, this is the completed building. To put it in another way, the architect's position is allied to the patentee who grants the use of his invention to someone to manufacture one of the articles. A clause should always be inserted in the agreement making it clear from the first that the drawings, &c., belong to the architect, and a note to that effect made on each drawing, &c. The full percentage on the estimated cost can be charged for the quantities.

Specification for Roadway.

OCKLEY writes: "Where could I get the usual heads of specification for laying out, making up and sewering a 50ft. and two 40ft. roadways, about 4,500ft. in all, in the metropolitan area?"

"Specification No. 5," price 5s. nett, contains all the information you require.

Builders' Bookkeeping: and Fixing Blocks.

WIMBLEDON PARK.—G. W. H. writes: (1) "Is there any book published that contains a satisfactory method of keeping builders' accounts, suitable for a small contractor's and jobbing business? (2) Do you know of any kind of composition fixing bricks that do not easily break, are fireproof, and will hold screws so as to dispense with the ordinary wood or breeze fixing brick?"

(1) We cannot recommend any of the books which have been published on the subject. (2) J. Wright & Company's fixing blocks; their address is South-Western Works, New Malden.

Acetylene for Country Houses.

LONDON, E.C.—X. Y. Z. writes: "What is the best form of acetylene plant for lighting a small country house requiring about sixty 15-c.p. lights?"

See the article on "Acetylene" p. 31 of our issue for August 15th, 1900, and the review on p. 57 of this issue.

Golf Club-Houses.

CHESTER.—W. P. W. writes: "Have you ever published designs or given any particulars of golf club-houses, with the exception of that illustrated in your issues for May 7th and 14th last? Should such a club provide accommodation for ladies?"

We published several designs for golf club houses in our issue for November 10th, 1897. Accommodation for ladies should certainly be provided, as the members may be expected to bring lady friends, and also in all probability matches will at times be played in which ladies will take part.

Curing a Smokey Chimney.

PETERBOROUGH.—H. M. S. writes: "The accompanying sketch (not reproduced) shows roof plan and section of a pair of villas. The chimney on the north side smokes very badly during a northerly or north-easterly wind. I have had a special chimney pot put on it, but this has not cured it. Can you suggest anything?"

You do not send interior section, showing the form of flue, but we presume there is a bend in the chimey laterally on the outside of the wall, and therefore not in the direction of a northerly wind, the consequence being that there is nothing to prevent such a wind blowing down. We think the smoking could be prevented by bending the chimney back above the eaves so as to go up by the ridge, or by putting a revolving cowl on the top.

The Caretaker's Cottage at Kensington Avenue Schools, East Ham, E., illustrated on the opposite page, is placed in the north-west corner of the playground and commands a view of the whole of the front of the school premises. The accommodation consists of parlour, kitchen, scullery, two bedrooms and the usual offices. The lower portion of exterior is faced with Leicestershire red bricks and the upper is finished in rough-cast coloured a pale buff. The woodwork is painted green, with the exception of the casements and sashes, which are finished white. The architect is Mr. S. Jackson, of 65, Fenchurch Street, E.C.

SANITARY INSTITUTE.

CONGRESS AT MANCHESTER.

A CONGRESS of the Sanitary Institute is being held this week at Manchester. It opened yesterday, when the Right Hon. Earl Egerton of Tatton delivered his inaugural address. In the course of this address he made the following remarks with reference to the Manchester sewage-disposal works:—

Manchester has constructed a network of sewers, the total length of which amounts to 1,700 miles. These sewers vary from 9in. in diameter to the main sewer of 14ft. 10½in. The total cost for this sewerage system serving all the population of over half a million has been upwards of £600,000. These sewers convey daily twenty-six million gallons down to the purification works at Davyhulme. This quantity is enormously increased at times by the storm waters. At present the purification of this sewage is partly but incompletely performed in settling tanks by the help of lime and copperas, the clear effluent being sent into the Ship Canal, and the sludge being sent away to the sea beyond the Mersey bar. To accomplish this result a capital expenditure of over £200,000 has been incurred. In addition a large scheme, founded on the investigations and recommendations of the best chemists and engineers, provides for a series of detritus tanks and septic tanks, in which the insoluble mineral matter in the sewage will be arrested, and as much as possible of the organic sludge digested by anærobic organisms. In this way the present large expenditure in chemicals will be unnecessary, and the cost of sludge removal greatly reduced. The effluent from the tanks will then pass on to 46 acres of primary ærobic bacteria beds. From those it will be further purified by passing on to 46 acres of secondary beds at Flixton, and finally, if necessary, 100 acres of land are provided to complete the purification. In addition to the 46 acres of bacteria beds at Davyhulme there are also 26 acres of storm filters to be laid down there, which are intended to purify the occasional excessive flow in time of storm, and to serve also as a stand by for the main bacteria beds. Thus the total capacity of the new works will be to deal with 126,000,000 gals. per twenty-four hours.

The scheme of these beds has been laid out as far as possible on broad and simple lines, so as to promote ease and facility of working.

The beds are, with few exceptions, of uniform shape and dimensions and the point of admission of sewage to each bed is in the centre of the longer side adjoining the supply channel, which serves as a rule an equal range of beds on either side, so that in general the distributing centres fall in pairs opposite each other.

Supply channels are of adequate width and gradient to permit of delivering the volume of sewage necessary for filling two beds at once on the same channel in the minimum required time by gravitation to each distributing centre in the scheme.

The sewage is admitted from the supply channel to a distributing reservoir, from which it flows over a sill or weir of circular form, and thence along channels cut in radiating form over the surface of the bacteria bed. These channels are lined with fine-grade material, which tends to arrest suspended matters on its surface, and retain them from entering into the body of the bed.

The under-drainage of each bed is also laid out in radial form, the drainage lines converging into a main collecting drain, which is concentric with the distributing weir, and which communicates at each end with manholes, or at the centre with an outlet well, from which the discharges enter the draw-off channel.

The under drains are channels formed in the concrete bottom of the bed, covered with stoneware perforated slabs, set in rebates, so as to be flush with the surface of the bottom.

The average depth of the clinkers forming the body of the bacteria beds is 3ft. 4in., each bed having a cross fall of 2½in., and the space between the radial drainage lines being formed with a ridge in the centre to facilitate the discharge of the final drainage at the bottom.

The body of the bacteria beds is composed of furnace clinkers from which the fine material has been removed by screening, and the coarsest material is used for covering more particularly the radial drainage lines, and also the concrete bottom as far as practicable.

About twelve acres of beds are now in operation, and the following method of procedure is recommended for the successful working of contact beds:—

(1) The bed should be worked very slowly at first, in order to allow it to settle down and the bacterial growths to form. In this way there will be less danger of suspended matter finding its way into the body of the bed while the material is still loose and open.

(2) The burden should not be increased till analysis reveals the presence of surplus oxygen, either dissolved or in the form of nitrates in the effluent.

(3) Analyses of the air in the bed may usefully be made from time to time during resting periods.

(4) The variations in capacity should be carefully recorded. If the capacity is found to be rapidly decreasing a period of rest should be allowed.

(5) Long periods of rest should be avoided during winter, as when deprived of the heat of the sewage the activity of the organisms decreases. If necessary the burden on the bed should then be decreased by reducing the number of fillings per day rather than by giving a long rest at one time.

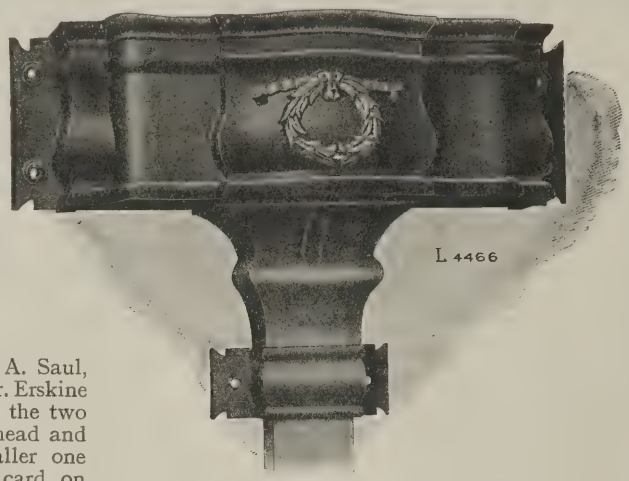
(6) The insoluble suspended matter should be retained on the surface by covering, at any rate, a portion of the latter with a layer of finer material not more than 3in. in depth. The suspended matter thus arrested should not be raked into the bed, but when its amount becomes excessive it should be scraped off. This should be done if possible, in dry, warm weather, after the bed has rested some days. By placing the inlet and outlet penstocks (or sluices) as close together as possible the suspended matter will tend to concentrate in their vicinity, and its removal will be facilitated.

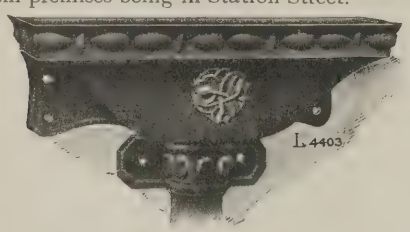
The total capital expenditure on sewers and purifying works in Manchester and neighbourhood will amount to £1,300,000, or rather less than £2 10s. per head of the population served.

With regard to the other local authorities in the Mersey and Irwell watershed, aluminoferric is used by nearly half the boroughs and district councils as a precipitant; nearly one-third use no precipitant at all. The sludge is mostly disposed of on the land, being either given or occasionally sold to the farmers as manure. Rochdale, Bury and Withington are also constructing new works on bacteria beds.

I desire to call special attention to the successful working of the joint committee in Lancashire and Cheshire, and to press upon the Government that similar legislation to that which is now confined to those counties and Yorkshire should be extended to the whole country and made compulsory. The manufacturers in these counties feel that all similar traders in the kingdom should be compelled to treat their trade waste in the same way, as the cost of treatment is a definite charge on the cost of production and should therefore be general.

The outlay by the manufacturers has been considerable, probably not less than £300,000, but the improvement of the river water is itself an important benefit to them when river water is used for manufacturing purposes.





KENSINGTON AVENUE BOARD SCHOOL, E.: CARETAKER'S COTTAGE. S. JACKSON, ARCHITECT.

Trade and Craft.

Some New Pipe Heads.

The accompanying illustrations show two of the several new designs for rainwater-pipe heads which Messrs. Lockerbie & Wilkinson, Ltd., are now introducing. It is a regrettable fact that so much of the work produced by commercial firms is of such wretched design, being in many cases the mere duplication of patterns which were never good and which have since become out of date. So that it is at least refreshing to see a firm like Messrs. Lockerbie & Wilkinson sufficiently enterprising to have new designs prepared for them by architects of ability. Of the two pipe heads here illustrated that numbered L 4466 was designed by Mr. J. J. Joass, and the other is the work of Mr. C. A. Nicholson, both well-known men; while other designs have been prepared by Mr. A. R. Myers, Mr. D. W. Kennedy, Mr. H. A. Saul, Mr. A. Wickham Jarvis and Mr. Erskine S. Cummings. The larger of the two designs now shown costs £3 (head and socket ears), whilst the smaller one costs 15s. 9d.—in iron. A card on which the entire set of new designs is illustrated will be sent on application to Messrs. Lockerbie & Wilkinson, whose London office is at 109, Victoria Street, their Birmingham premises being in Station Street.

A Diagram Map of Ventilation.

In commemoration of the Coronation and also of the jubilee of the scientific application of natural ventilation as a complete system (developed fifty years ago by the late Mr. Robert Boyle, senior, in conjunction with Prof. Michael Faraday) Messrs. Robert Boyle & Son, Ltd., the well-known firm of London and Glasgow, are presenting to the schools in this country and the Colonies a large educational diagram illustrating "natural" ventilation as applied to buildings. About 50,000 of these diagrams will be sent out, and as the ordinary sale price of each is two guineas the very great expense to which the firm has thus gone will be readily appreciated, more especially when it is stated that the gift is not prompted solely for business considerations, but for the promotion of a better knowledge of the subject of ventilation in schools. A record of the progress made in regard to this branch of science may be found in the biography of the late Mr. Boyle, senior, wherein is also described the earlier work of the present Mr. Robert Boyle, who has devoted his whole life and a considerable portion of his private fortune to the subject.

Whilst referring to this matter it is interesting to note that "Meteor III.," the new racing yacht built in America for the German Emperor, is ventilated on the "Boyle" system with "air-pump" ventilator (upcast) and patent downcast ventilator, which effect a continuous change of air between decks in all weathers. The "Boyle" system was awarded the £50 prize, with grand diploma (the only prize offered), at the International Ventilation Competition, London, presided over by Lord John Manners, and the highest award for ventilation at the last Paris Exhibition—two gold medals and one silver medal—when the best known systems in Europe and the United States competed. It is employed in the British and foreign navies, and by the principal steamship companies in this and other countries, from whom Messrs. Boyle have received many valuable reports, one being from a First Naval Lord of the Admiralty and another from Lord Kelvin in connection with the application of the "air-pump" ventilator to his yacht "Lalla Rookh." The Russian Government are extensively employing the "Boyle" system, sixteen battleships having up to the present been ventilated throughout on this system, whilst others are in progress. The Indian troopship "Hardinge"—the largest troopship, we believe, in existence, designed by Sir Edward Reed for the British Government, and recently built by the Fairfield Shipbuilding Co., of Glasgow—is fitted throughout with the system, selected by the Admiralty as being the most suitable for the very trying conditions existing in such a vessel.

Law Cases.

Forming Streets too Narrow. — At the North Shields Police Court on Wednesday last John Thomas Alexander was summoned for a breach of the Tynemouth Corporation by-laws by forming a new street—King Edward Road—of a less width than 40ft. Mr. H. A. Adamson (town clerk), who appeared for the Corporation, said that in November, 1896, the Duke of Northumberland, through his agent, submitted an estate plan showing building sites adjacent to Tynemouth Railway Station. The plan showed 40ft. streets, and was approved. In June last Mr. Alexander deposited plans for the purpose of building villas opposite to Holy Saviour's Church in King Edward Road. This plan, too, showed a 40ft. street, and it was passed by the Buildings Committee, their action being confirmed by the Council. In building the boundary wall, however, the defendant narrowed the street to 37ft., and therefore contravened the by-law. Mr. G. R. Duncan, addressing the Bench for the defence, contended that there was nothing on the estate plan or on Mr. Alexander's plan showing that any portion of the ground purchased by his client would be required to make the road 40ft. wide. There were no buildings on the opposite side of the road to Mr. Alexander's, and until there were erections there, or a continuous line of buildings on his client's side, no street could be said to be formed. Mr. Alexander gave evidence to the effect that he had not in any way encroached upon the roadway or the footpath. He had rebuilt a wall upon the same site as the old wall. The Bench considered there had been an infringement of the by-law, and imposed a fine of 20s. and costs.

Engineering Notes.

The Designs for the New Sonning Bridges show lattice girders of light construction.

Synod Hall, Londonderry, is being warmed and ventilated by Messrs. John King, Ltd., engineers, of Liverpool.

Conway Suspension Bridge.—Mr. John J. Webster, C.E., has been instructed to prepare the necessary plans and specifications for the repair of this bridge at a cost of £6,500. Details of the work were given on p. 22 of our issue for August 27th.

The New Lock at Teddington is now in course of construction, work having been in progress for the past sixteen months. The lock, which is being built in accordance with the plans of Mr. Charles J. More, the engineer to the Thames Conservancy, will, when completed, be the largest on the Thames, and will possess accommodation for a tug and six barges at a time, as against a tug and a barge, which is the holding capacity of the present lock. It is to be 650ft. long and 25ft. wide, the length of the old lock being 177ft. To allow of its construction the Conservators have acquired three acres of Ham Fields from the trustees of Lord Dysart, and the existing lock-keeper's house will have to come down and be rebuilt elsewhere. The present lock, with the rollers at the side, will be retained to supplement the new one, which runs nearly parallel with it, and the heads will be level with each other up stream. The lock cut, however, is to be greatly widened, nearly as far as the iron footbridge, which connects the Surrey shore with the lock island and Teddington. The first section, upon which nearly 100 men are at present engaged, is nearly completed. The lock is being built of concrete, with granite copings, facings and sills, and will be provided with three pairs of large and powerful sluice gates to divide the lock into two enclosures. The present weir and channels will in no way be affected by the big work now in hand, which it is expected will be completed within the next nine months.

Tenders.

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, *Effingham House, Arundel Street, Strand, W.C.*

Bristol.—For builders' and plumbers' work connected with the erection of school premises at Mina Road, Bristol, for the Bristol School Board. Mr. H. Dare Bryan, architect, 38 College Green, Bristol:—

Masters and Men.

The Trade Union Congress was held last week in the Holborn Town Hall. In offering the congress welcome Sir John McDougall, chairman of the London County Council, said that no persons who were not fair employers should step in, take contracts, and deprive the workmen of wages which it was agreed they should have. He had no hesitation in saying that one of the best things the Council had set up was the Works Department, which had caused the contractor to do his work in a better way and at a more reasonable price than would otherwise have been the case.—In the report of the Parliamentary Committee it was stated that in America the conditions of labour were very serious in the centres where trade unionism was weak. But with some exceptions the utmost consideration was shown workmen by employers. Cheaper and more rapid facilities of transport, together with superb natural advantages in mineral wealth, made America a formidable world competitor with us. The Trusts had not up to now made any bad use of their combination, wages having a tendency to increase. The delegates were pleased to see an approach being made to conciliation and arbitration in most of the States.—A resolution was passed in favour of limiting the hours of labour to eight per day in all trades and occupations in the United Kingdom. Another resolution was passed urging the need for an amended Compensation Act which will provide for all injuries, extended to all trades and employments, no matter where such accidents occur, compensation to be paid from the first day of injury. And another resolution was passed in which the congress expressed its utmost contempt for the continued obstinacy of Lord Penrhyn in persisting in his refusal to allow the points in dispute between himself and his workmen to be settled by independent arbitration, "and pledges itself to render every assistance in its power by money and Parliamentary agitation to carry this struggle against arbitrary feudalism and landlordism to a successful issue." Mr. Stevenson (London United Builders' Labourers' Union) moved a resolution stating that it was imperative in the interests of the building trades that inspectors should be appointed for the proper inspection of plant and machinery in constructional work in buildings in the course of erection or demolition. He instanced the Belfast mill disaster. Mr. J. Emerson (London Carpenters and Joiners) seconded the resolution, which was agreed to unanimously. A resolution was passed, on the motion of Mr. H. C. Bye (Navvies' and Builders' Labourers Union), instructing the committee to prepare a Bill which shall have for its object "the compulsory check-weighing or measuring in all metalliferous mines, quarries, public works, cement and lime factories, and all other non-textile factories." In reference to the vote on the previous day in sympathy with the Penrhyn quarrymen, the president announced that the Bricklayers' Society had resolved to raise £800 by a levy of 6d. on its members.

The Burton-on-Trent Stonemasons, who have been on strike since July 1st for an advance of wages, have notified their willingness to accept the offer of the Burton Master Builders' Association to submit the question to an arbitrator appointed by the Board of Trade. Pending the arbitrator's decision the men returned to work on Monday last, the employers undertaking to pay, from the time of the resumption of work, the rate of wages awarded in the arbitration.

Coming Events.

Wednesday, Sept. 10.

An Architectural Causerie.

Three Men. [Scene: A private room at the Office of Works.] Lord W. to Lord E.—"Ah, there you are. I thought I would just pop in to see you about a few matters." Lord E.—"Delighted. Take a seat." Lord W.—"I will not stay long, but I'm somewhat puzzled about this new appointment. Of course it's very nice to be secretary, but people are so unreasonable nowadays, for they actually expect you to know something about buildings and architects and all those kinds of things; and how should I know that?" Lord E.—"Oh, I shouldn't trouble myself. I did very well, and I assure you—of course between ourselves—that I don't know the difference between a Doric column and any other. All you have to do is to assume a knowledge of the details, which are therefore beneath discussion, and generalize officially. But here's another visitor. Why, it's A.-K. Yes, excellent, isn't it. Congratulations, of course; but just fancy being bothered about your official ignorance of a subject: why, it's the very thing to pull one through." Mr. A.-K.—"Well, I find it all goes smoothly enough when there are no pig-headed executors or art-instilled members of the Upper House to worry you. But when that happens, the pay isn't sufficient compensation for the trouble." Lord W.—"How much did you say?" Mr. A.-K.—"Why, a paltry £2,000 a year. And just think what I have to do for it." Lord E.—"Wonderful devotion to duty. A martyr." Lord W.—"I hope I shall not be so bothered." Mr. A.-K.—"First it's one architect that dies and then another, leaving their work unfinished; and of course it would be all right if I were only left alone to do what is necessary. There's a staff here for that very purpose. For what else do you think we pay one architect £1,200 a year and three more £1,000 each, besides a host of subordinates, all geniuses in their own way. They talk about the Record Office. But it's simply superb, and right in face of them we've put up a charming little lodge on the Fetter Lane side, just to show, you know, that the Office of Works is capable of preserving intact the individuality of another's hand, instead of parading an arrogant self-styled personality." Lord W.—"Quite so. I have seen the little lodge you speak of. Very fine." Lord E.—"So have I. It's in what you call the Classic style, I believe." Lord W.—"Oh! no, the Gothic—Flamboyant you know. Isn't that so, First Commissioner?" Mr. A.-K.—"Yes, yes. Well, not exactly. A kind of mixture, you know. Just enough to remedy it from dulness." Lord W.—"Ah, by the way, I must congratulate you, E., on that wonderful annexe. I couldn't believe my eyes." Lord E.—"Just a trifle, you know. One of those little things we do in spare moments—unostentatiously, you know, with none of that bluster so characteristic of our critics." Mr. A.-K.—"You really should have allowed it to remain as a permanent example of what you can do when the call comes; instead of selling it as scrap to a builder. Indeed, I think it was quite as good, if not better, than the Abbey itself: only of course one daren't say that officially, otherwise it might be taken for egotism." Lord W.—"I quite agree with you." Lord E.—"As I say, we do things quietly. Compare our action, for instance, with that taken in regard to the Queen Victoria Memorial. What a fuss they made." Mr. A.-K.—"Exactly. We should have done much better, and much cheaper, too. Besides, we might have had statues of ourselves, you know—just a select few—disposed around as a slight recognition of our ability. I am sure, W., you would look well on the top of a column, or posed artistically in a group symbolic of the Office of Works, with an inscription below—'Alone we did it; it were better so.' While I myself might be pouncing out on the Child of Darkness with an outstretched spear or a pair of compasses." Lord E.—"And what about myself?" Mr. A.-K.—"Oh, why, you could be sitting in the Chair of Truth with a model in one hand, while with the other you could be bruising the head of the Architectural Critic." [Much laughter, which continues as the three go out together for their lunch.]

DRAWN BY HEATON COMYN, A.R.I.B.A.

"White Lion Inn," Oundle. This is one of those picturesque old country hostels to be seen in Northamptonshire. It is a typical example of domestic work in that county—note especially the finials to the dormers and the corbelling-out of the sides of the dormer windows. The inn is situated on the east side of the church in the main street up from the railway station. There is another inn—the "Talbot"—in Oundle similar to it, one which is more generally sketched, but the "White Lion" is certainly the more interesting as a study of Northamptonshire domestic architecture.

OLD FURNITURE IN THE SOANE MUSEUM.

By X.

CONSIDERING the general taste and the love of collecting of the late Sir John Soane (borne 1753—died 1837), whose house in Lincoln's Inn Fields is by special Act of Parliament permanently preserved as a museum in the interests of all who are in any way connected with the profession of architecture and decoration, and considering the very great extent of his collection of architectural and furniture designs, the actual furniture of his house is, as regards variety and special interest, somewhat of a disappointment.

There are, however, a few pieces which are well worth an inspection, and it is with these that the writer wishes now to deal.

Fig. 1 shows a very fine Chippendale arm-chair purchased by Sir John Soane about 1780, just when the productions of this epoch-making furniture designer were at

FIG. 2.—OLD ENGLISH CHAIR (DATE PROBABLY ABOUT 1730).

their zenith. The decoration is striking, the carving including floral, shell, scroll, portrait and ornamental design work, yet each so introduced as not in the least to spoil the harmony of the whole. The seat front is in three segmental curves and is plain cane-seated. The arms join the frame by a curve from the back and the centre scroll of the latter joins the back frame similarly by means of a graceful curve over the front at each side.

In the same room—namely, the combined dining-room and library—are eight old English chairs (see Fig. 2). They are of singular design, richly inlaid with mother-of-pearl, and bear the arms of Sir Gregory Page, Bart. (the son and heir of Sir Gregory Page, of Wricklemarsh, near Blackheath, created a baronet in 1714), with those of his wife, Martha, third daughter of Robert Kenward, Esq., of Yalding, Kent. The suite probably came from Wricklemarsh, which was sold by the nephew, Sir G. Page Turner, in the year 1733 to the Cators of Beckenham. The date of manufacture is considered by Mr. G. H. Birch, F.S.A. (the curator of the Soane Museum), to be probably about 1730. The style is distinctly Hogarthian — in fact, chairs almost identical in pattern and design, save for the inlaid work, are to seen in several of that master's paintings.

Fig. 3 shows a massive and very handsomely-carved walnut side-table which was formerly in the possession of Sir Robert Walpole. On the top of this table is a slab of marble inlaid with a variety of specimens of rare marbles and other precious stones.

We next come to a very strange piece of furniture —Fig. 4. This chair is one of a pair cast in iron and weighing about half a hundredweight each. They were drawn by Sir John Soane himself and specially made for him. A writer once suggested that this chair might well be copied in a dark wood, "the unsightly bolts necessitated by the iron being of course eliminated as it is most effective and distinguished in appearance besides being comfortable for use," but with this kind of proposal no person of taste will in any way agree.

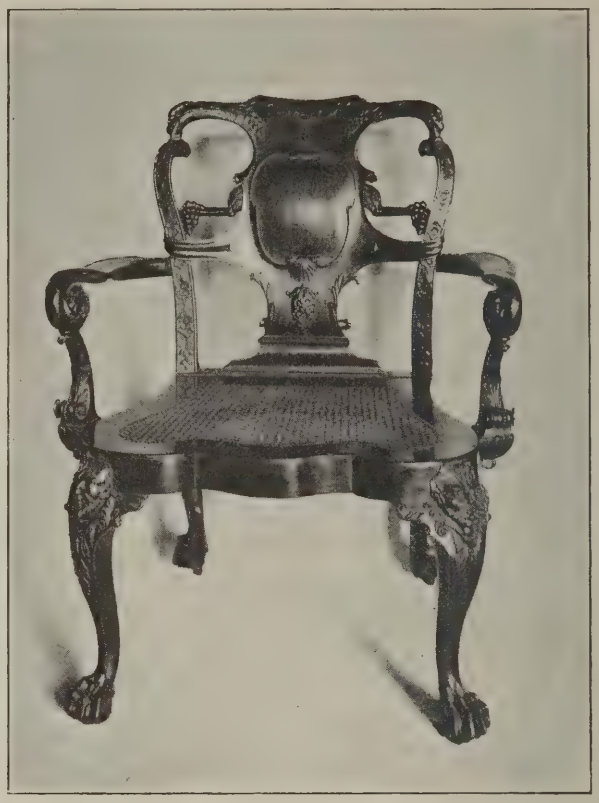

FIG. 1.—CHIPPENDALE ARM-CHAIR.

Fig. 5 shows a slight double settee by Adam, both elegant in design and chaste in execution. The upholstery, at the present time of dark leather, is not in good keeping with the frame. Originally it was doubtless covered in some silk of delicate colour and pattern that harmonised more with the slight and graceful frame, the wood of which is rosewood.

Fig. 6 shows one of a pair of handsome old English carved oak chairs. It is just the kind which might be made use of as a model by such misdirected manufacturers as now turn out so much "black oak." The legs and under-frame would of course on the ground of cost be unsuitable for modern cheap furniture, but the carved back offers a great field for the mechanical duplicator.

A real Sheraton arm-chair is shown in Fig. 7. The double curve of the arms, the fluted column legs and side pieces and the trellis back are all characteristic of this master.

[The Soane Museum is situated on the north side of Lincoln's Inn Fields (No. 13) and is open free from 11 to 5 on Tuesdays, Wednesdays, Thursdays and Fridays during March, April, May, June, July and August. It is a most interesting museum for an architect to visit.]

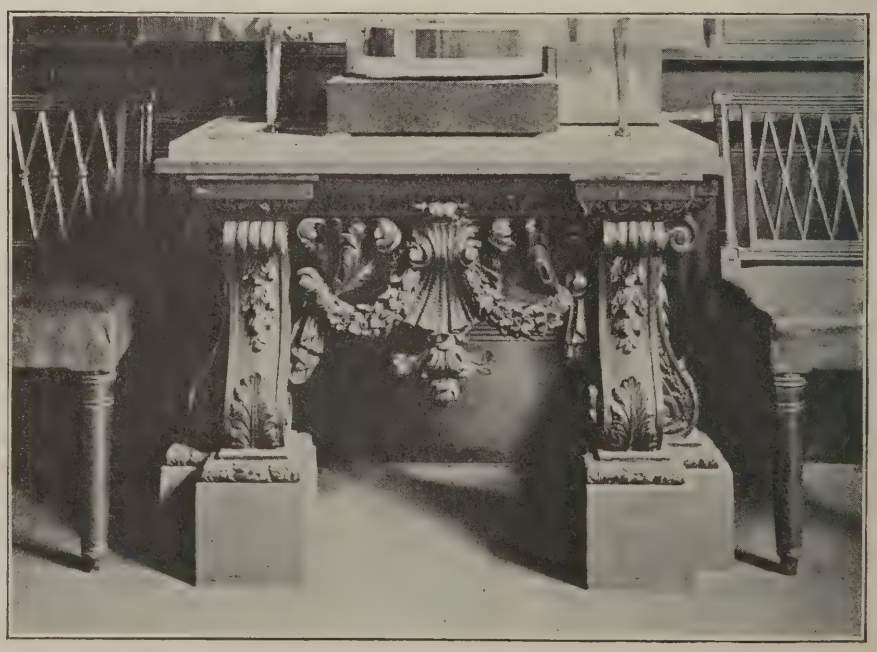

FIG. 3.—WALNUT SIDE-TABLE.

THE TREATMENT OF SMOKE.*

A SANITARY PARALLEL.

By W. N. SHAW, M.A., Sc.D., F.R.S.

FOR the sake of clearness I wish to cast what I have to say in the form of a parallel or analogy. I wish to regard the smoke in fog as the element of the problem to which special attention should be directed, and to regard the smoke as a species of domestic or industrial refuse which has to be removed somehow or other. I propose to look upon the removal of smoke as a problem not dissimilar in its fundamental character from that of the removal of sewage, and in what I have to say I wish to keep in view the analogy that exists between the elements of these two problems. I choose the problem of the removal of sewage for this purpose, because it is a problem in which sanitary reformers have achieved gradual but conspicuous success during the nineteenth century, and even within the memory of the present generation, to the great advantage of the whole community.

In large towns we have travelled very far in the path of development from the original instinct as regards the problem of the disposal of sewage-polluted water, but there has been no corresponding progress in the disposal of smoke-polluted air. In London, at a cost to the community of £211,000 a year, or 1·38d. in the pound on ratable value, nearly a million tons of sewage are removed day by day for about 600,000 houses—about a ton and a half on the average for each house.

During the same period, namely every day in winter, each house throws into the atmosphere on the average perhaps ten tons of smoke-laden air, or a total quantity of five million tons of smoke-laden air for the inhabited houses of London per day, or possibly seven millions of tons per day if we include factories.

That is my estimate, on grounds which I will give later, of the amount of refuse which we throw into our atmosphere for beneficent chance to remove, if it can. The actual weight of solid soot which gives colour and body to the smoke is a very uncertain quantity; it may in the worst cases amount to nearly 3 per cent. of the coal consumed, and the houses of London probably get rid of 300 tons of solid refuse every day by throwing it up the chimney. It is mixed with much larger quantities of other more or less injurious products of the combustion of coal, complete or incomplete; but it is with the soot, which alone darkens and defiles, that I am primarily concerned.

The Initial Stages of the two Problems.

The difference of our attitude towards these two problems is very conspicuous, yet, physically speaking, the whole difference between the problem of the removal of sewage and that of the removal of smoke on similar lines lies in the comparatively trivial distinction that under the action of the mysterious force of gravity the sewage naturally goes downwards, whereas, in the first instance, smoke goes upwards.

You may object that I have neglected to take into account the relatively large volume of smoke as compared with that of other forms of house-refuse; I simply reply that if the smoke of our fires had been in the habit of falling downwards and finding a lower level instead of rising to a higher level and making its way up the chimney, we should long ago have been driven into solving the problem of its disposal as we have been driven to deal with the disposal of sewage, no matter how great the volume might be.

The mention of the circumstance that

FIG. 4.—A CAST-IRON CHAIR.

smoke goes upwards instead of downwards leads me to point out that in days not so very remote the arrangements for the disposal of smoke might be regarded as comparatively in advance. The genius who first conceived or put in practice the idea of confining smoke to a narrow flue specially built for it wrought a revolution in house-building. There are still archæological survivals which show that before his day there were architects who were satisfied with the more simple provision of a hole in the roof, and there are even traces extant of a still earlier architectural style of inhabited dwelling in which such rudimentary provision as a special opening for smoke did not exist.

I will spare your feelings: I will not attempt to describe the corresponding stages in the development of the means of disposal of other kinds of refuse: they could be traced—*gardy loo* is the survival of a warning with special meaning in the Scottish capital—and examples of present-day practice might be adduced in illustration. But while the disposal of sewage has been generally though slowly progressive since the first commissioners of sewers were appointed in 1531, the invention of the chimney seems to have been so successful as to paralyse mechanical enterprise in that department until the subject was taken up in later years by cowl makers, who have devoted much ingenuity to the improvement of the terminal outlet.

I am not overlooking the fact that immense improvement has been made in grates for burning coal, both as regards economy of fuel and in some examples as regards the amount of smoke produced. That is another branch of the subject; at the moment I am concerned with the disposal of the waste products independently of the amount produced, and for domestic purposes the simple chimney, with or without the assistance of a cowl, remains a sufficiently effective apparatus; the practice of using it to throw smoke into the atmosphere, to be carried away by any currents of air that may arise, is universal.

Smoke and Fog.

One of the incidental obstacles to a scientific treatment of the smoke question is that at first sight the atmospheric currents appear to perform the duties of general scavenger with such exemplary efficiency that few people give any thought to the general success or failure of the method itself. On foggy days they become aware of the nuisance which they have created, and accordingly desire that steps should forthwith be taken to remove or prevent fogs, with the understanding that whatever does away with the fog will at the same time do away with the smoke nuisance. Now the prevention of fog as a meteorological phenomenon is one of the demands which I think we are not legitimately entitled to ask as practical men of science; it is beyond the ambition even of physical science. To use the parallel further it would be just as reasonable for us to throw all our refuse into the streets, and, when we found that it accumulated beyond endurance, demand of men of science that they should provide showers at suitable intervals to wash it all away.

There remains for us to consider the removal of fog by the actual removal of the foggy air of London. I have on several occasions seen suggestions which seemed to regard such a scheme as possible, but I have never been able to understand where the air would be sent to and by what it would be replaced. A heavy snowfall, which may give about 10 tons of snow for every 100yds. of street, defies the powers of local authorities to remove it, and the removal of the street air, of which 17ft. of height would give the same weight for the same length, might well be regarded as beyond the

FIG. 5.—DOUBLE SETTEE BY ADAM.

* A paper read before the Sanitary Institute Congress at Manchester on September 10th, 1902.

FIG. 7.—SHERATON ARM-CHAIR.

resources of civilisation, even if it could be loaded up in carts. That is out of the question, and I think we may agree that the removal of foggy air from the streets is as hopeless a matter as the prevention of fog, and that when once smoke has been allowed to be discharged into the free atmosphere all chance of removing it is gone.

Some Facts about the Smoke Nuisance.

Moreover, it is not only on foggy days that the method of leaving the atmospheric currents to act as the smoke scavengers fails. In large towns the system is, generally speaking, inefficient. It is a matter of common knowledge that one of the results of London smoke is a very considerable reduction of the amount of sunshine and daylight. We may say that in summer London loses one-sixth of its sunshine, and presumably also about the same fraction of its daylight, on account of its smoke, while in winter its loss amounts to one-half for a similar reason.

The contrast of the figures for summer and winter is remarkable. As regards smoke, the difference rests chiefly on the fact that there are fewer domestic fires in summer, and we may therefore legitimately conclude that the domestic smoke is the most serious item to be reckoned with in considering the smoke question. It is, in fact, two-thirds of the problem. During the past winter Captain Carpenter, R.N., D.S.O., has been conducting an enquiry for the Meteorological Council into the prevalence and distribution of fogs in London, and in the course of his investigation has ascended on separate days in each week the Victoria Tower at Westminster and the upper gallery of the dome of St. Paul's Cathedral. These two buildings are a mile and a half apart as the crow would fly, but on no single day was Captain Carpenter fortunate enough to be able to discern the one building from the other until March was well established. There is here no question of persistent fog: it is smoke.

What steps can we take? So far as I know, the only suggestion put forward as practicable by those interested in the abatement of the smoke nuisance is to invite householders and compel factory owners not to make smoke, or to consume it if they do make it, or, in the third event, to make as little as may be consistent with their own interests. As regards factories, very considerable improvement has followed these efforts, and I do not wish to be adversely critical when I point out, first, that the distinction drawn between the factory and the domestic establishment is unscientific, and, secondly, that that was not the plan adopted in the parallel case of the removal of sewage. Am I not right in saying that the advance in sanitation, in that particular, has arisen from the fact that the local authorities have used common funds to provide facilities for the removal of such refuse by main drains or otherwise, and have then compelled householders and others to make use of the facilities provided?

Municipal Chimneys.

I would like to follow the analogy somewhat further, and subsequently call attention to the share which a local authority could fairly take in such an enterprise, supposing it were agreed that the proper course to be pursued is not to prevent smoke by penal legislation but to encourage the interception of smoke and the removal of the sooty particles before the air is allowed to escape. I do not wish to say that this is the only or the best mode of dealing with the question; I only want to consider whether it is, *prima facie*, practicable enough to justify our including enquiries with regard to it in the demands that sanitation may reasonably make upon science.

The suggestion may seem hopelessly extravagant, but if you will allow me I will offer a few considerations in mitigation of your criticism of my venturesome proceeding.

First, there is nothing new under the sun—since I commenced putting my notes together I have learned that practically I am only recalling a suggestion made many years ago. A proposal for the treatment of smoke by the erection of municipal chimneys was made in Manchester by one who was prominent among the many Manchester men of business who have been distinguished by their scientific achievements, Mr. Peter Spence.

Secondly, the present method of dealing with smoke is by no means final, although, as I have said, it has marked a most important stage of progress In many cases it achieves its primary purpose excellently, yet one of the most conspicuous features of London architecture is the enormous variety of smoke cowls in all stages of dilapidation to be seen surmounting the roofs. Almost every chimney stack is a sort of museum of contrivances for improving the action of chimneys. I do not know what precise meaning to attach to the different states of dilapidation, but the mere exhibition of so many contrivances can only mean that smoky chimneys are not by any means so rare as they might be under more favourable mechanical conditions. I should be glad if someone would be good enough to remark that the differences of height of roofs of the London houses make the treatment of smoky chimneys especially difficult, because that would enable me to put my second consideration the more forcibly by saying that on that very account, if on no other, the separate chimney method of dealing with smoke is not suited to the circumstances of large towns.

Thirdly, I notice that when the designer of a factory erects his building he takes a further step in advance in the treatment of smoke, and provides a single smoke stack for a considerable number of independent fires. The existence of this practice makes me regard the separate opening of each chimney of the domestic house into free air as not absolutely required by any physical laws governing the removal of smoke. The factory builder is not always successful in using his chimney for preventing smoke, but he is successful in leading the foul air of many flues into one channel which might afford an opportunity for depriving the smoke of its soot.

Moreover, arrangements for propelling air mechanically are becoming every day more extended. Some of them as employed in various systems of ventilation are quite as elaborate as any that would be required to deal with the smoke of an ordinary house or block of houses. A public dining-room is hardly regarded as properly equipped in the present day unless it has a fan for the ventilation, generally for the removal of tobacco smoke after dinner. Laboratories and other buildings of a similar character are provided with special means, mechanical or thermo-mechanical, for removing noxious fumes. There is no sufficient distinction to be drawn between coal smoke and other forms of refuse that foul the air to make it necessary to use one system for the former and a different one for the others. It thus seems almost certain that if the domestic architect had sufficient encouragement to make the attempt, he would not find the plan of dealing with household smoke by the method of the factory chimney or by mechanical propulsion beyond the range of practical physics.

The plan of using a single combined orifice for the delivery of the smoke of a number of chimneys of a domestic building has

FIG. 6.—OLD ENGLISH CHAIR (OAK).

actually been introduced in the case of a building that had originally, and still has, its separate flues, unless I have been deceived by external appearances. Within sight of the windows of my office is a row of three houses the roofs of which are much below the level of surrounding buildings. Most chimneys in such situations in London are separately provided with some sort of cowl, but in the case I speak of groups of four chimney stacks at the angles of a square have been capped, and a single flue led from each stack to a central chamber surmounted by a large lobster-back cowl. From this central cowl the smoke of the four chimney stacks is delivered to the outside air. This example seems to me to be especially encouraging, because it shows that if it were desirable to drain away the smoky air of houses with a view to "treatment" it might not be considered necessary to entirely rebuild the houses.

The cost of dealing with the sewage of London is about £600 per day. I have of course no means of estimating what the cost of dealing with smoky air would be, but supposing that a ton of dirty air could be "treated" for the same cost as a ton of sewage, the cost of clearing the air of London might be set down at £4,200 a day, equivalent to a rate of 10d. in the pound.

I would mention incidentally that to move air is a comparatively cheap matter. An electrically-driven fan will do the day's work of a single chimney, as regards smoky air, at a cost of about a penny, under suitable conditions. A single colliery fan has been made to deliver as much as 200,000 cub. ft. of air per minute, and its output therefore amounts to about 10,000 tons a day, or sufficient to carry the smoke of more than 1,000 London houses on the scale mentioned above. Five hundred of such fans would carry the household smoke of the whole of London. It would mean a huge aggregation of power, but London means the same.

These figures show that although the volume of smoky air is vastly larger than the volume of sewage, yet the cost of dealing with it for the purpose of treatment may not be of an altogether different order of magnitude from the cost of the manipulation of London sewage, and the point at which I wish to arrive is that we are justified in asking practical men of science, as a first question, whether the treatment of smoky air, on a plan somewhat similar to the treatment of sewage, is mechanically possible within reasonable limits of original outlay and current expense.

I do not suppose that it is possible to establish a few main drains for smoky air corresponding to the main sewage drains, and to use one or two cleansing stations for purifying the air from smoke. I made a rough calculation, and concluded that to deal in that way with the smoky air of London would require about forty tunnels of the size of the Underground Railway tunnels to carry away the air, but in the case of air it might be possible to achieve a similar result by a large number of systems on a correspondingly small scale, and the systems might be some of them municipal and some private. A single block of houses might have means for drawing off the smoke from all its fires into a chamber wherein the smoke could be treated before the fouled air was allowed to pass into the atmosphere, and if such a system were mechanically feasible we should then be able to put a second question to practical men of science, namely, whether it is not possible to completely deposit from the air as it passes on its way the solid particles which form the smoke. I should like to ask whether it is not possible to make a further advance in the direction indicated by Sir Oliver of purifying air from smoke by electricity.

It ought in fairness to be pointed out that the successful treatment of smoke would not do away with the effects of fog altogether. Under the most favourable circumstances as regards smoke there would still be fog, and probably more fog in London and other large towns than elsewhere, on account of the acid fumes among the products of combustion. The fog would be white, and white fog itself would cause serious interference with road, river and railway traffic as it does with sea traffic now. But the large number of London fogs that are smoke and nothing else would disappear, and the avoidance of these and the abstraction of the smoke from the others would very largely diminish the losses attributable to fogs.

The questions I have suggested as suitable for being put before practical men of science are two, namely: first, whether it is mechanically and economically possible to substitute for the present system of chimneys a method of collection of the used air of houses by mechanical or thermo-mechanical means, so that it may be subjected to treatment before being delivered to the outside air; and, secondly, whether under these circumstances it would be possible to deposit the soot, electrically or otherwise, in some part of the course of the air.

Smoke-removal and its relation to Ventilation.

I would like to point out that such a system would have some incidental advantages. It would provide a persistent and calculable system of ventilation that would enable hot-water or steam pipes to be used advantageously much more generally than they can be at present.

The ventilation of a domestic house under existing conditions is very largely dependent upon its active chimneys, and has to be treated accordingly. If one could rely upon the regular abstraction of a definite quantity of air, it would be possible to modify the arrangement in various ways for the general convenience of the household. And not the least among the advantages of such a system must be reckoned the facility it would afford for diminishing the amount of smoke produced independently of the facilities for removing it after production. At the trials in connection with the Smoke Abatement Exhibition, South Kensington, the most effective results were obtained with grates that had what may be called a downward draught, that is, a draught that carried the smoke from the external coal through the fire. To manage a grate of that kind in an ordinary house requires special arrangements, but with the provision of means for the constant abstraction of air it would be easy to secure these most favourable conditions.

Contribution of Local Authorities to the Problem.

If an enterprising architect were to erect a block of buildings and provide it with means of delivering its used air free of smoke at an outlay of, say, £1,000, with an annual cost of £25 for maintenance, I presume the local authority would reward him for his public spirit by increasing the ratable value of the property on account of the outlay, and thus fine the owner a considerable sum per annum for his rash enterprise. The owner would also be placed in the unfortunate position that whereas by avoiding smoke he had conferred as much benefit upon all his neighbours as upon himself, he would have to pay the whole fine of increased ratal himself, and would still have all the disadvantages of his neighbours' smoke.

I would suggest that, instead of pursuing so unreasonable a course, the local authorities might recognise public spirit of this kind by reducing the assessment of a property that, to the satisfaction of its neighbours as well as of a surveyor or inspector, produced no smoke, so that the rates upon such a property should be decreased by, say, 6d. or 1s. in the pound instead of being increased. This would afford direct encouragement to practical men of science to design and keep in action means for the prevention of smoke, and would lead to gradual improvement.

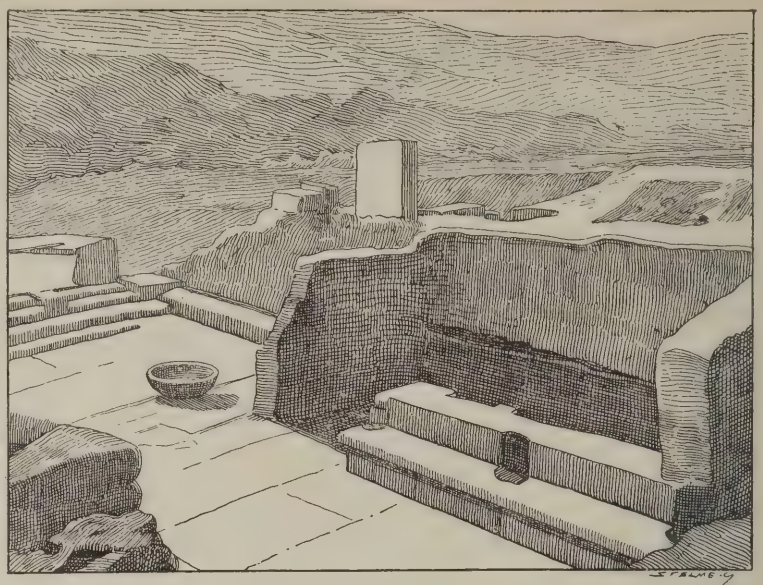
Such a system would, as I have suggested, be in the first instance a direct encouragement to progressive experiments, and in the end would enlist the active support of all those possessing arrangements for avoiding smoke in favour of effective compulsion for those who had not.

To put the questions I have indicated to men of science in this way would be merely a matter of business, and if the questions were so put I venture to express the confident opinion that the science of the twentieth century would give as satisfactory an answer to the question of the treatment of smoke as the science of the nineteenth has given to the question of the treatment of sewage.

Writing to the "Morning Post" Mr. Ellinor C. L. Close says: "Last spring I contracted with a firm of builders to connect the chimneys of the mews at the back of Eaton Square into one horizontal flue, which is to be connected with the main chimney of one of the largest houses in this block; and I think the draught thus created will effectually remove the discomfort caused to many of the dwellers in the mews by their smoky fireplaces."

THE A.A. BROWN BOOK.

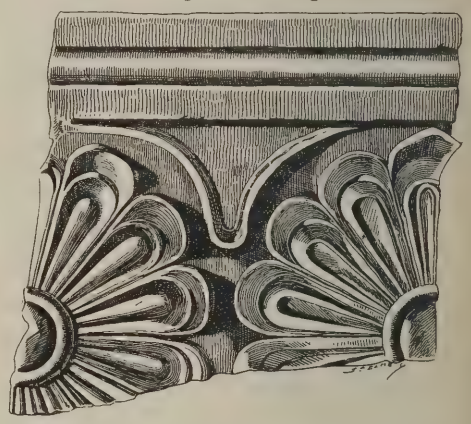
THE Brown Book of the Architectural Association for 1902-3 has just been issued. We note that a few changes are made in the list of evening lecturers and instructors. Formerly Mr. F. R. Farrow, F.R.I.B.A., took elementary construction and materials; English architecture to A.D. 1500; outlines of mediæval and Renaissance architecture in Europe; and construction. The first of these subjects is now taken by Mr. C. E. Varndell, A.R.I.B.A.; the second by Mr. A. M. Watson, B.A., A.R.I.B.A.; and the third by Mr. Banister F. Fletcher, A.R.I.B.A., who also, in place of "construction," deals with Classic ornament. The syllabus of meetings is as given on p. 42 of our issue for September 3rd; but we note that the annual conversazione will be held on October 31st at the Royal Institute of Painters in Water-Colours. The subject set for the A.A. silver medal is: "A town hall for a small country town on an isolated site 100ft. by 60ft., the long side to be treated as the principal side." The subject of the essay prize is: "The life, work and influence of Robert Adam and his brothers." The report of the Camera and Cycling Club for the past session states that in order to extend its usefulness it has been affiliated with the Royal Photographic Society. The total membership of the Association is now 1,392, an increase of forty-six during the year—the report of the Committee mentions that the membership has progressively increased during the past eleven years. The Day School has been attended by fourteen students, eight of whom completed one year's course and entered offices as articled pupils; while it is hoped that all, or nearly all, will join the second year's course. At the close of the session £4,285 had been collected towards the new premises, and though this amount may not justify the Committee in embarking on a building scheme at present it goes some way in that direction. The register has again been of service to many members, although the demand for assistants has been rather below the average. The number of students attending the studio and evening classes was 198; this is a slight falling-off compared with previous sessions, but the results attained were very satisfactory. As regards finance, the accounts show a balance on the right side of £142, so that the Association is in a thriving condition.



B

AN EXCURSION TO THE HOUSE OF MINOS.

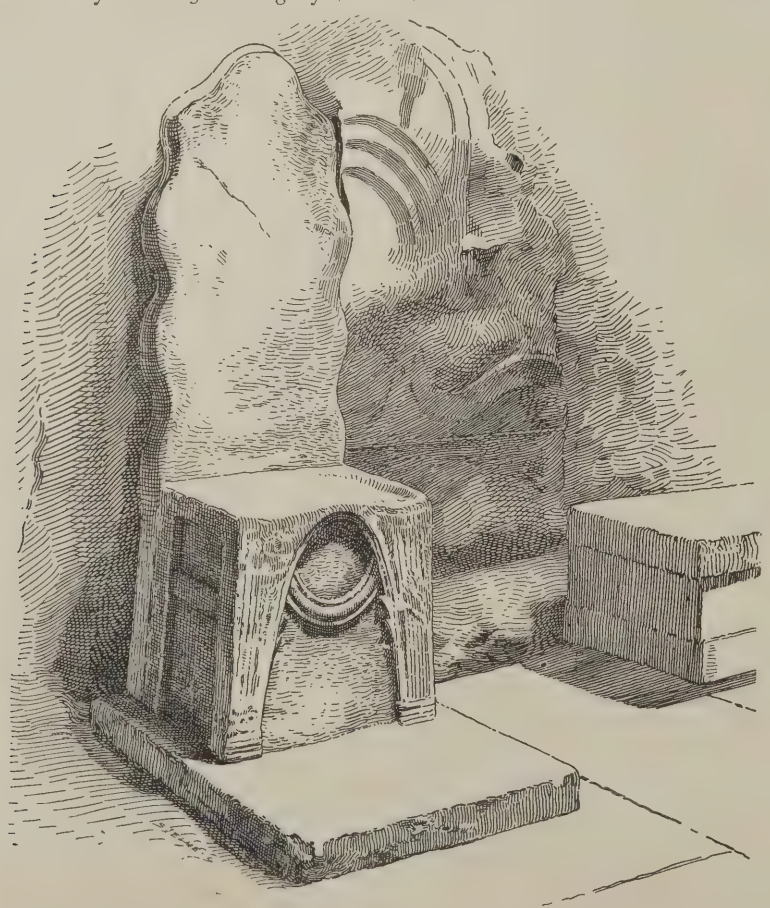
LEAVING the museum at Candia, the most populous town in Crete, let us set out for the field of the excavations at Knossos. Outside the ramparts of the town we find ourselves in a bright country sown with olive and fruit trees. Soon we see in the distance Mount Ida silhouetted against the sky like a gigantic cone set in the middle of the plain, and after about an hour's ride on ponies the excavations are reached. They at first surprise us, for there no acropolis, no eminence—nothing to suggest a place so famous. But there, in a great plot, lies the excavated Palace of Minos, the disposition of which is shown by the accompanying plan. It is seen that the eastern terrace, which formerly seemed to be part of an esplanade encircling the palace, forms in reality a great interior court bordered by two groups of buildings. Among the newer excavations made on the slope that leads to the river are seen some small store-rooms, an olive press, a small court enclosed by a colonnade and a large room for devotional exercises: and, lastly, what is most curious, a stair with four stages and about fifty steps leading to a higher level. It should be remembered that all these rooms are of medium size—the largest of them is only about 30ft. long by 15ft. wide: so that there is nothing to recall the enormous proportions of the Assyrian palaces or the Egyptian temples. Some corners of the excavations have the picturesque appearance of Pompeii, particularly the twenty small store-rooms arranged off a long gallery on the western side of the palace, where are about fifty tall jars, intended to be used for provisions, grain, wine and oil—such jars as the forty thieves might have hid in. In the floors of the rooms themselves small rectangular pits (in some cases sheathed with metal plates) have been dug for the reception of the more precious objects: but nothing has been found in them, for, after the fire which laid waste the palace, and of which traces are visible in many places, the inhabitants decamped with everything of value.



THE PILLAR OF AXES.

POOL IN THE THRONE ROOM.

On the south side a flight of steps leads to the propylea which, judging by the fragment of rose-work which has been discovered (and here illustrated), must have been very beautifully decorated. The moulding of the petals and the pleasant curves of the corollas are rendered on the stone with a delicacy which suggests the best works of classic Greece. Were this fragment found in the vicinity of the Erectheum it would not disgrace the collection of magnificent fragments strewn around the Athenian citadel. One understands how much the Ionic order owes to its archetypes which, in Crete and elsewhere, drew from the plant and the flower the classic elements of stone decoration.



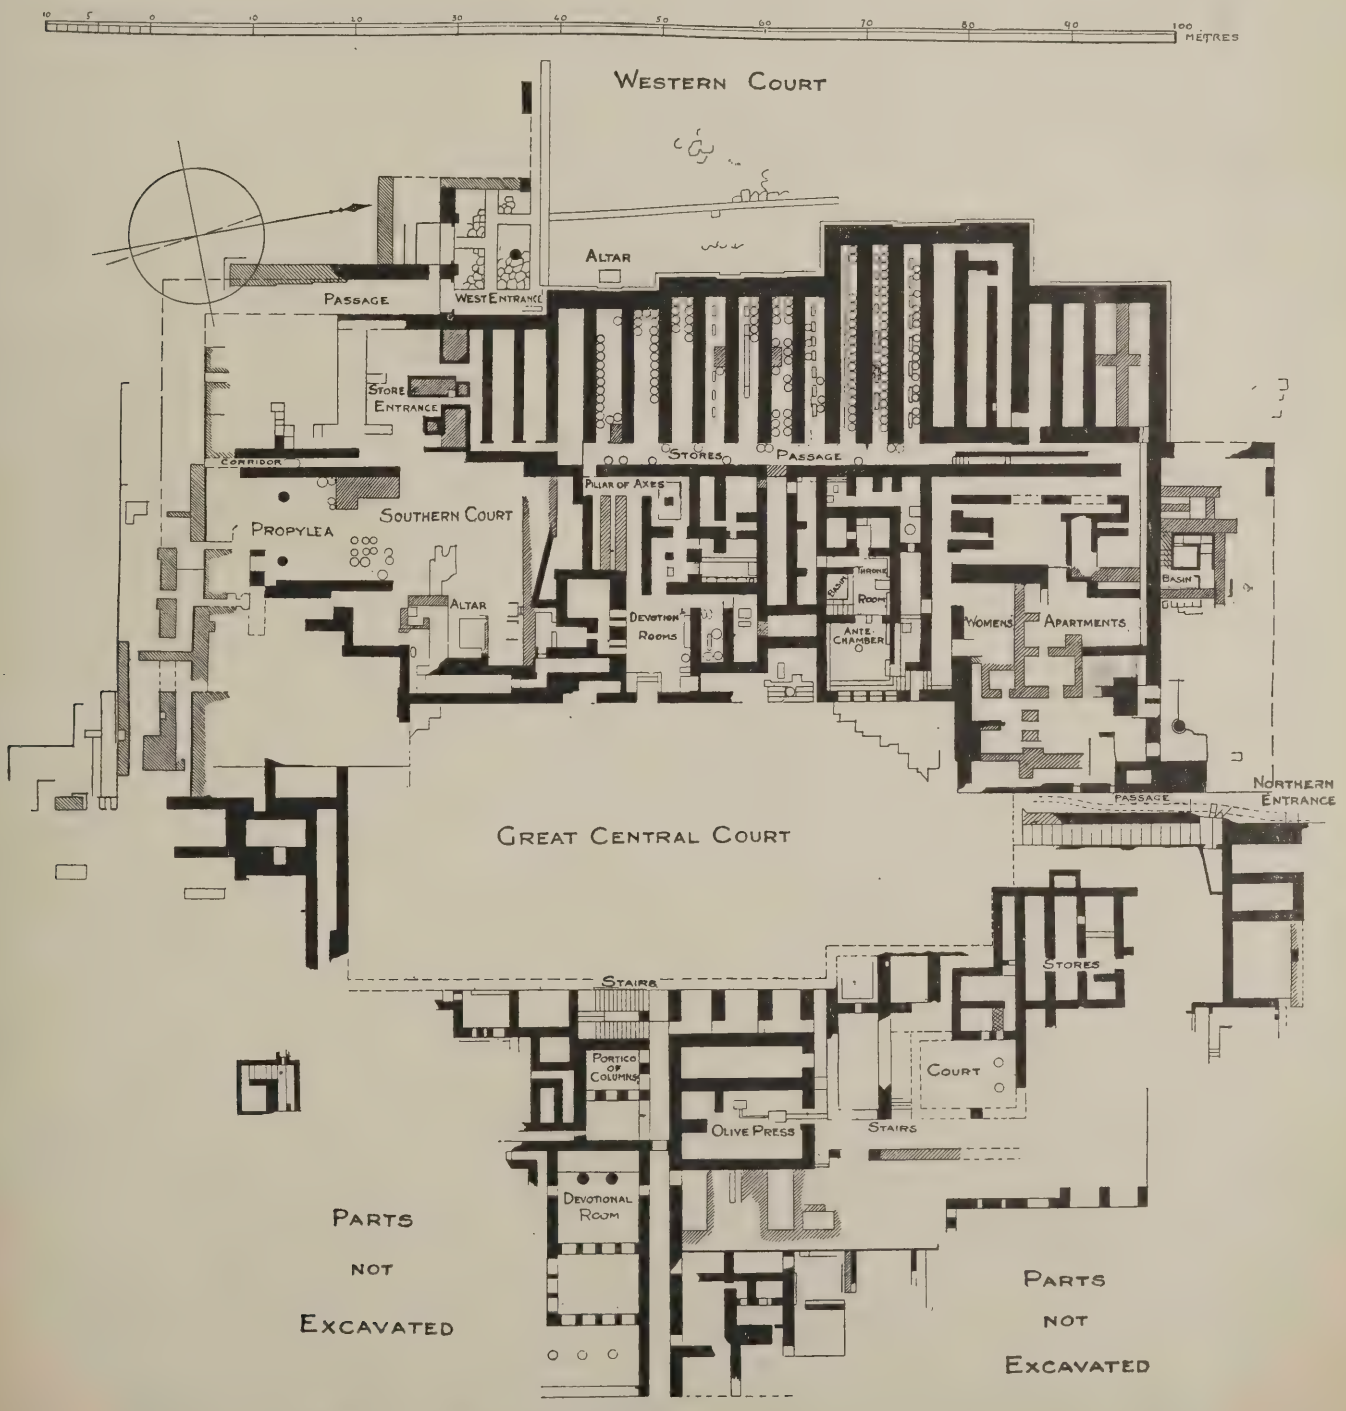
FRAGMENT OF SCULPTURED ORNAMENT.

The great central court gives access, on the west side, to three groups of buildings—to the left, a chapel; in front, the reception-room; and to the right, the women's apartments: in each of which have been found monuments or personal objects adapted to the uses of the building.

The sanctuary is recognizable by two pillars formed of large square blocks arising to about 6ft., and on each stone is deeply cut the sign of the Double Axe, that symbol of the warlike cult of the Cretans which has furnished an ingenious explanation of the word "Labyrinth"—"the House of the Double Axe."

The last excavation has brought to light on the east side a second sanctuary, larger than the other and having a room enclosed by a columned portico, besides a place provided with a platform attached at the bottom to the wall and covered with incised signs of the sacred bipenne. It is probable that on top of the pillars themselves were placed instruments of war—axes and clubs—as one sees figured on some Oriental cylinders.

THE THRONE OF MINOS IN THE PALACE OF KNOSSOS IN CRETE.



The adjoining part of the palace has an air of luxury and comfort. After crossing a small vestibule one enters the reception-room, called the "Throne Room" on account of the large stone seat which forms its chief embellishment. This seat, as will be seen by the accompanying illustration, is raised on a flat flag-stone and has the appearance of a throne; and the originality of its forms proves better than anything else how much Cretan art preserved its individuality in the face of Egyptian and Chaldean models. This throne with its curved outline and pointed ornament below the seat—this chair of wood translated into stone—is more like a Gothic prie-dieu than a pre-Hellenic piece of furniture.

The benches on either side and in front of the throne are very simple: they are formed of square blocks of well-polished stone without moulding of any sort, but their construction is remarkably careful. Homer's verses come to mind where the seniors of the people are represented "seated on polished stones and holding in their hands the sceptres of the sonorous voiced heralds." To reconstruct a similar scene in the hall of Minos is no effort, and it is a dramatic evocation of that king of old of whom legend has made a kind of cruel magician, whereas, in reality, he was the chief legislator of barbarian Europe.

One other curious detail completes the appearance of the room. In front of the throne is a deep hollow to which one descends by steps cut in the stone. The bench at the brim of this hollow has three wide notches in which the beams fitted for supporting the roof-covering of the pit; and as there is no trace of any cutting for water it is certain that the roof received the rain and let it fall into the pool: so that, in a country burnt with heat, the architect had the ingenuity to utilise these reservoirs for cooling the rooms, and we thus have here what afterwards became the atrium of the Romans and the most ancient example of the Latin *impluvium*. The disposition of the bathrooms in other parts of the palace is analogous, and above one of them, by a happy conception, is a decorated frieze representing fishes swimming.

The decorative painter naturally played an important part in this throne room, and here were the landscape paintings and the two crouching griffins to be seen in the museum at Candia. The position of the harem is also known by the paintings on the walls of the northern rooms: in fact, each part of the building was decorated appropriately to its uses.

Of the numerous objects discovered in this wonderful palace there is now no space to speak, but a brief reference should be made to the clay tablets—numbering more than two thousand—on which an unknown language is cut. Should these strange characters

PLAN OF THE PALACE OF KNOSSOS CRETE, EXCAVATED UNDER THE DIRECTION OF MR. ARTHUR EVANS.

B 2

ever be deciphered, then we shall know of what race was this mysterious people.

But it is time to journey back to Candia, whence we go with a vivid impression of this resurrection of the Cretan world—made possible by the work of Mr. Arthur Evans and his comrades on the site of Knossos.

[The foregoing is translated and adapted from an article in the current issue of "La Revue de l'Art Ancien et Moderne."]

New Patents.

These patents are open to opposition until October 20th.

1901.—Water Carts.—18,140. R. WADSWORTH, Thomas Street, Halifax. This invention relates to those water carts which have rotating discs for distributing the water over the road, and its special feature is an arrangement of small valves, vertical coupling-rods and horizontal slides for regulating the quantity of water to a nicety. The valves are in the bottom of the tank at the back end, and to each is attached a coupling-rod that projects on top of the tank and is there operated by a sliding device. By these means the width of the spread can be instantly varied from 8ft. up to 40ft.

Earthenware Drain Pipes.—18,632. R. H. SMITH, "The Woodbines," James Street, Nuneaton. The socket end of the pipe is moulded in the die with grooves for cement keys. These grooves enable the air to escape when trapped in the clay between the small and large diameter, and also lock the joint.

Joiners' Ploughs.—19,915. G. J. BODY, 6, York Road, Aldershot. An attachment is clamped to the plough so that it may be fitted with a fillistering iron and be used for sashes, doors, &c., thus dispensing with the need for a fillister.

Band Saws.—20,223. A. E. MUIRHEAD, Cast Forge, Glasgow. The saw ribbons are mounted on pulleys and the slack is taken up when necessary by a third pulley, while suitable guide rollers are employed to give the ribbons a twist so as to bring the cutting edge to the front. Thus, one, two or more saws may be run on one pair of spindles.

The following specifications were published on Thursday last, and are open to opposition until October 27th next. A summary of the more important of them will be given next week. The name in italics is that of the communicator of the invention.

1901.—10,320, WICKSTEED, tool holder for planing, shaping and similar machines. 16,781, GREGG, baths. 18,207, FLETCHER, FLETCHER & Co., LTD., firebrick back for iron fret-fires. 18,825, DOULTON & MANGER, water-softening apparatus. 18,892, SYKES, continuous flow pump. 20,923, SOC. GILARDONI FILS A. BRAULT ET CIE., tile presses. 22,269, WINDER & PARKER, gulleys. 26,437, SELLARS, building blocks, tiles and artificial stone.

1902.—902, YOUNG, locks. 3,862, HAGAN, HAGAN, WHITCOMB, HAYNES, WHITNEY, CRANE, FELLOWS & CRANE, measuring instruments for surveying purposes. 5,358, HALL, lift or draw-bridges. 8,891, SUMMERTON, apparatus for operating Venetian blinds. 9,332, LAKE *(Warren)*, asphalt, cements, &c. 10,404, GUT, valve. 10,494, FULLER & UNITED ASBESTOS CO., LTD., vices. 10,510, SANDERSON & HUMPHREY, rendering washable paper printed with water-colours. 11,497, REYNOLDS, brick presses. 11,593, WALBINGER, impregnation of pasteboard and paper with tar, asphalt, &c. 12,032, WRIGHT, window screens. 12,392, HORN & RÖNITZ, machines for working, dressing or grinding stone. 13,772, DONOHUE & MORAN, preventing escape of smoke from chimneys. 14,763, HOBBIES, LTD., & JEWSON, hand-planes. 15,165, YOUNG, telescopic levelling staves. 15,502, DELAIRE & DESTEINBACHBERICK, machine for cold-twisting bars of railings, balustrades, &c.

Law Cases.

Brickmaking Refuse.—A case of considerable interest to the Kent brickmaking trade was heard recently at the Sittingbourne Petty Sessions. Messrs. Smeed, Dean & Co., Ltd., of Sittingbourne, who are at the head of the Kent brickmaking industry, were summoned by the Sittingbourne Urban District Council under the Public Health Act of 1875 by reason of a nuisance arising from a large accumulation of London refuse upon their brickfield. On July 11th this heap of refuse, which was 40yds. long, 30yds. wide and 2yds. high, and is about 1,200yds. or 1,300yds. from the Town Hall, became ignited, and the fumes beat down into the town, causing much discomfort to the inhabitants. The evidence showed that correspondence had passed between the Council and the firm upon the subject, but no attempt had been made to put out the fire. Proceedings then followed. It was contended that the refuse was the rough stuff which had been sifted after the ashes used in the burning of bricks had been taken from it, and that for purposes of brickmaking it was useless. It was suggested that the defendants might have put up a destructor, as had already been done by one local firm with success, or they might have cut a trench through the heap and separated the burning portion, extinguishing the same with water or smothering it with earth. To all of these suggestions it was stated that those methods had been tried on previous occasions, and that the remedy was worse than the disease. The principal witness for the defence was Mr. George Andrews, the manager, who said that his firm employed 1,400 hands and paid from £70,000 to £80,000 every year in wages. For the past fifty years the firm had burnt "rough stuff" without any prejudicial effect to health. What the public suffered from was, he maintained, the smell of the open sewer discharging crude sewage into the creek, of which complaints had been made by his firm to the council for years. No attempt had been made by the defendants to put out the fire, as it was impossible to do so. The court held that the case had been proved, and the defendant were fined 20s., were ordered to prevent a recurrence of the nuisance, and were mulcted in costs to the extent of ten guineas. Notice of appeal to the quarter sessions was given.

Views and Reviews.

Sewage Analysis.

It is, of course, necessary at every sewage-disposal works to both test and analyse the crude sewage and the effluent, in order to ascertain what amounts of chemicals, &c., have to be added to effect purification, and whether the effluent is sufficiently pure to be discharged. It is of the utmost importance, therefore, that the chemist or engineer should have a competent manual, and this book by the superintendent and chemist of the Manchester Corporation Sewage Works most adequately supplies the need. The book is clearly written and systematically arranged. The author lays particular stress on the fact that in the ordinary chemical treatment of sewage merely the grosser solids, &c., are precipitated, and the substances actually in solution pass away in the effluent, and unless the chemicals have been added in such quantities as to sterilize the latter these impurities will undergo putrefaction, provided the necessary conditions arise. This is what requires most careful watching, for we have heard of instances where incompetent persons having been left in charge of the works the effluent has been discharged unsterilized, with almost as bad an effect on the purity of the stream as the crude sewage. The biological process is undoubtedly the soundest in principle, but the question of its cheapness is at present debatable. The book deals with the determination of the chief constituents in sewage, with most useful tables at the end for quick calculation. It is surprising that engineers do not in this newly-established industry use the metric system, for it would save endless trouble, and the system, being employed by all scientists, would be uniform. The use of standard chemical solutions in testing is another method of saving labour and securing uniformity. The book can be highly recommended, and should be purchased by all engaged in the management of sewage works.

"Sewage Works Analysis," by Gilbert J. Fowler, M.Sc. (Vict.), F.I.C London: P. S. King & Son, Orchard House, Westminster. Price 6s. nett.

CITY SUBWAYS.

New By-laws for Preventing the "Street-up" Nuisance.

THE City of London (Various Powers) Act empowered the City Corporation to frame by-laws to deal with the nuisance caused by the constant tearing-up of the streets, and at the present moment some proposed regulations are awaiting the confirmation of the Board of Trade.

Although the new by-laws give no guarantee against the cutting-up of the streets in the future, they provide sufficient power of regulation to prevent a repetition of the chronic chaos which disgraced the streets of the City two years ago. All companies using subways in the City are brought under some sort of discipline at the hands of the Corporation. Moreover, the governing body of the City is, for the first time, empowered to levy annual charges for the use of the Corporation's subways by any company or person having statutory powers to break up the streets.

In case of sudden emergencies particulars of the repairs needed must be sent in writing to the City engineer, and three days before any company can place a service pipe or wire into a subway notice must be sent in writing, accompanied by full particulars, to the Guildhall. No company will be permitted to commence the execution of any work which will involve the alteration or reconstruction of any part of a subway until the expiration of forty-eight hours after notice has been given to the owner of every pipe or wire in the subway.

To minimise the risk of explosions, special precautions are provided in the new by-laws.

To secure the safety of the public, it is provided that no grating or other means of access to a subway shall be opened or allowed to remain open without a temporary fence being provided and a watchman left to guard it. All companies owning pipes or wires in a subway must within six months of the confirmation of the by-laws deposit with the Corporation full particulars of the pipes and valves, and within a further period of six months, if so required by the City engineer, plans of the same.

With regard to the fees and charges, the Act requires that a charge of 5s. per day will be imposed for laying, altering or removing pipes or wires from a subway, and 1s. will be charged for opening or closing a subway at any time other than the periodical visit of the officers of the Corporation. Should a company fail to carry out the by-laws or supply incorrect information it will be liable to a fine of £5, and to a further penalty of 40s. for each day during which the offence is continued.

THE BRITISH ASSOCIATION.

THE British Association met last week at Belfast. In the course of his presidential address, Professor Dewar spoke of technical and other education, the pith of which is suggested by the following sentence: "In all educational matters it is the average man whom we have to consider and the average ability which we have to develop."

The Education of Engineers

formed the subject of Prof. John Perry's address to the engineering section. His remarks applied only to the boy who really wished to become an engineer. Of those who merely dropped casually into the profession, but had no real fondness for it, he did not speak. Much of this putting of boys into positions for which they were not naturally adapted was due to our want of a rational system of general education. If we possessed that, the real bent of boys would be discovered at an earlier age. At the same time, he thought (it might be prejudice) that no one would be the worse in the long run for receiving the early training which is suitable for an engineer. In describing what this should be, he wished it to be understood that he had in view the average, not the exceptional, boy. His (the speaker's) own experience had told him that the best way with every pupil, young or old, well or ill prepared, was to approach his intelligence through the knowledge he already possessed; that, of course, meant very considerable diversity of method and great flexibility of system. Circumstances had enabled him to follow such a system; in some environments it would have been impossible. But at Finsbury the professors were given a free hand, and there were no outside examiners. The result was a considerable divergence from the usual course of teaching. For instance, those of chemistry and physics would have been called by some critics rational chemistry and applied physics —the course of mechanics was really one in mechanical engineering—there were lectures, elementary and advanced, tutorial classes, where paper exercise work was done, experimental plane and solid geometry and graphical calculation, and most important of all was the laboratory, where every student worked, making quantitative experiments. Each was trained in the use of every machine in the place; to understand its parts and to know what was required of them.

The Proper Training.

Some persons, perhaps, would refuse to call this engineering laboratory work, and would scorn it as merely experimental mechanics. But, in his opinion, elementary principles were the main things needful, and were just those of which the highly-educated student often had no real apprehension. For himself, he disapproved of elaborate steam engines for laboratory exercise work; the great thing was to use a machine which all could readily learn to handle, and to teach them to appreciate successively the work which every part of it could do. One fault of that generally adopted was that subjects—such, for instance, as mathematics, physics and chemistry—were usually taught "in watertight compartments." Their inseparability was what students ought to understand: that the one was constantly merging into the other, and many principles in them were common. The separation, also, which was so often made between theory and practice, was indefensible; for the one could not have a real existence without the other; practice was the expression of the theory, and the principle of the practice. He held it also very important that the teacher should not be excluded from professional work.

Mathematical Professors.

Professor Perry, continuing his address, said:—When the pure mathematician is compelled to leave the logical sequence which he loves to teach mechanics he is apt scornfully to do what gives him least trouble—namely, to give as "mechanics" that disguised pure mathematics which forms 90 per cent. of the pretence of theory to be found in so many French and German books on machinery. But how is a poor mathematical professor who dislikes engineering, feeling, like Pegasus, harnessed to a common waggon—how is he to distinguish good from evil? He fails to see how worthless are some of the books on "theoretical mechanics" written by mathematical coaches to enable students to pass examinations. An engineer teaching mathematics would avoid all futilities; he would base his reasoning on that experimental knowledge already possessed by a student; he would know that the finished engineer cannot hope to remember anything except a few general principles, but that he ought to be able to apply these, clumsily or not, to the solution of any problem whatsoever. Of course he would encourage some of his pupils to take up Thomson and Tait, or Rayleigh's "Sound," or some other classical treatise, as an advanced study. Not only do I think that every teacher in an engineering college ought to have some acquaintance with engineering, but it seems to me equally important to allow a professor of engineering, who ought, above all things, to be a practical engineer, to keep in touch with his profession. A man who is not competing with other engineers in practical work very quickly becomes antiquated in his knowledge.

The Opinion of the Average Engineer.

The average engineer not merely looks askance at, he is really opposed to, the college training of engineers, and I think on the whole that he has much justification for his views. University degrees in engineering science are often conferred upon students who follow an academic course, in which they learn little except how to pass examinations. This kind of labelled scientific engineer is being manufactured now in bulk because there is a money value attached to a degree. He is not an engineer in any sense of the word, and does not care for engineering, but he sometimes gets employment in technical colleges. He is said to teach when he is really only impressing upon deluded pupils the importance of formulæ and that whatever is printed in books must be true. The real young engineer, caught in this eddy, will no doubt find his way out of it, for the healthy experience of the workshop will bring back his common-sense.

Scholastic Standardization.

In the scholastic industry there has been far too much standardization. Gymnasium and polytechnic systems are standardized in Germany, and there is a tendency to import them into England; but in my opinion we are very far indeed from knowing any system which deserves to be standardized, and the worst we can copy is what we find now in Germany and Switzerland. What we must strive for is the discovery of a British system suiting the British boy and man. We cannot go on much longer as we have done in the past without engineering education, and, furthermore, it must be such as to commend itself to employers. To have any good general system the employers must co-operate. Much of the training is workshop practice, and it cannot be too often said that this is not to be given in any college. In Germany recently the great unions of manufacturers made facilities for giving a year of real factory work to the polytechnic students, but it seems to me that these men are much too old for entrance to works, and, besides, a year is too short a time if the finished product is to call itself a real engineer. Possibly the British solution may be quite different from any of these. A boy may enter works at fourteen on leaving a primary school, or not later than sixteen on leaving a secondary school. It will be recognized as the duty of the owners of works to provide, either in one large works or near several works in a well-equipped school following the Finsbury principle, all that training in the principles underlying the trade or profession which is necessary for the engineer.

Prehistoric Building Construction.

On Friday a paper was read by Mr. William J. Fennell before the Anthropological Section on "Some Ulster Souterrains," in which he remarked that the north east corner of Ireland was peculiarly rich in evidences of prehistoric man. Though no houses of any kind were known to exist attributable to the Stone Age, there was another class of built structure—the souterrain—which might be claimed as the primeval architecture of the country, for these souterrains existed in great numbers, and fresh ones were constantly coming to light.

A souterrain might be defined as a subterranean place of refuge, and, in that sense only, a dwelling. The entrance was either naturally difficult of approach or cunningly hid, and the interior was generally long, low, narrow and winding, and beset with frequent barriers, locally known as "difficulties," through which only one person could pass at a time, and then only by creeping.

The souterrains were not burrows, but vaulted chambers connected by passages, well defended and built of dry masonry walls and roofs, and afterwards covered up by earth and eventually hidden by vegetation. The exterior covering was always very thin, so that in many cases they were close to the surface. The construction was invariably of rough unhewn stones from the neighbourhood, and the roof was invariably formed by the overlapping of one stone on another, a system followed into much more recent times. The barriers were formed of walls rising from the floor almost to the roof, then a space of 12in. or more to the next wall, which descended from the ceiling to within 15in. of the floor, and leading in some cases to a long low tunnel 16in. or 18in. high, with a similar barrier at the other end.

No two souterrains were alike in plan; some were straight, or almost so, with chambers branching off; some were extremely short; while others were considerably more than 100ft. long. The souterrain at Muckamore was a solitary example of a two-storey building, entered from the field level to the upper floor and from that to the lower one.

Mr. Fennell thought that it was impossible to assign a date to these rough rude structures, but the diminutive one at Connor, co. Antrim, had two Ogham stones inserted, so that at least some of them must have been erected much later by a race who used an alphabet. It showed a distinct advance in building construction in the use of a series of lintel stones—including the Ogham ones—to support the roof, but even in this case it seemed to have been simply a place of refuge.

Human Beehives.

Mr. George Clinch, F.G.S., read the next paper, which dealt with "Some Ancient Subterranean Chambers recently discovered at Waddon, near Croydon." He said that excavations for a sewer at Waddon House in June, 1902, revealed three subterranean chambers cut in a bed of Thanet sand, and partly occupied by sand which had fallen or been washed into them. In each chamber, however, a compact floor was found at about 15ft. below ground. The chambers were of beehive shape about 7ft. high and 12ft. or less in diameter. Each had its independent entrance opening on the south-south-east side, but no other means of access till the domed roofs were cut open by the sewer

trench. Below the sand which covered the floors of the chambers several cores and chips of green-coated flints were found, with small fragments of imperfectly-baked pottery and larger fragments of Romano-British pottery. Similar chambers had been noted in Britanny and elsewhere. The subterranean "beehive tombs" at Mycenæ also were identical in plan, though different in dimensions and material.

The Waddon discovery was therefore of some importance as evidence for the size, shape and plan of prehistoric dwellings; the vaulted roofs cut in hard sand reproducing in general form the interlaced boughs, benders and wickerwork of the ordinary surface hut, and the lateral passage the doorway of the neolithic dwelling. The same idea of interment within a house survived during the Bronze Age; but when cremation came into vogue a miniature copy of the Bronze Age house—the "hut urn"—was sufficient repository for the ashes. The tradition of the circular neolithic hut was carried on in the Celtic beehive dwellings of Cornwall, Wales, Scotland, Ireland and Gaul, and probably in the circular buildings of subsequent English architecture. The Bronze Age dwellings, on the other hand, which were reproduced in the "hut urns," might be regarded as the prototypes of the square or angular forms of ecclesiastical and domestic architecture.

Mr. David MacRitchie read the third paper on

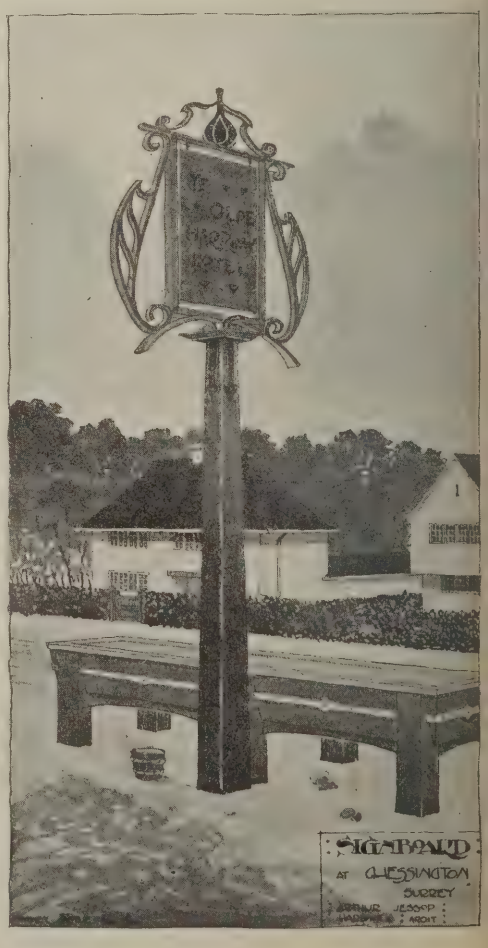
Underground Dwellings in the British Isles.

It was hardly possible to conceive of human dwellings more archaic in character, and yet some of them, if not all, belonged to the times that are quite historic. Two specimens, one at Crichton in Mid-Lothian, and the other at Newstead in Roxburghshire, must have been built after the arrival of the Romans in Britain—and probably a long time after that date—for the reason that a number of dressed stones with Roman ornamentation had been used in their construction, presumably taken from Roman ruins. In a few instances the dwellings had a fireplace, but this was very exceptional. Like the similar dwellings of the Eskimos, these underground habitations were so well protected from the cold of even the keenest winter that a fire was not necessary, and oil lamps sufficed for heating, lighting and cooking. From their characteristics, therefore, these underground structures quite justified the name of "earth-house" which was given to them in the Norse sagas and also in living popular speech. In appearance they varied considerably, but most of them had their roofs about a foot or two below the surface of the ground, entrance being obtained from above by one or more downward-slanting passages. They were built of rough, undressed, unmortared stones, the walls gradually converging until they met in a "cyclopean" or "false" arch, completed by large flagstones laid across. In some cases their very small dimensions supported the traditional belief that they were built for a dwarfish race.

Mr. Arthur Evans's Latest Communications respecting Knossos.

Mr. Arthur Evans communicated an important report on his continued excavations of the prehistoric Palace of Knossos in Crete, the greater part of which, embracing an area of about five acres, has now been uncovered. A very interesting feature was the complete system of drainage, including latrines with flush pipes and a succession of stone shafts descending from the upper floors to a network of stone ducts beneath the pavement of the lower rooms, large enough for a man to make his way along them. Fresh fresco paintings were discovered, including one of a lady in a very modern jacket, dolphins and other fish, and naturalistic foliage and lilies. The exquisite ivory figures of youth showed "the art of Dædalos" in its highest perfection, displaying naturalistic details not found again in such work till the age of the Italian Renaissance. Another extremely interesting find was the remains of a large mosaic of porcelain plaques, many of them representing houses, so that a whole street of "the city of Minos" as it existed about 1500 B.C. could now be reproduced. Here, too, were strangely modern features—houses of three storeys, some semi-detached, and showing windows with four or six panes, oiled parchment having, perhaps, been used in place of glass. The whole seemed to have formed part of a large design showing scenes of peace and war analogous to those of Achilles' shield. The palace was found to climb down the eastern slope of the hill to a point about 90 mètres below the northern entrance, the lowermost terrace having been supported by a quadruple line of wall. On the slope underneath the later Mycenæan palace had been found extensive remains of the magazines of what seemed to have been an earlier royal dwelling going back into the third millennium B.C. The excavation of the south-eastern corner of the palace had still to be completed, and certain work of delimitation had to be carried out in other directions. Unfortunately, the total amount that the Cretan Exploration Fund (including the grant from the British Association) had been able to contribute towards the year's expenses had again fallen far short of what Mr. Evans had been called upon to expend.

Bricks and Mortar.



Aphorism for the Week.

It is the addition of the mental ἀρχή . . . which separates architecture from a wasp's nest, a rat hole, or a railway station.—RUSKIN.

Our Plates. MARLBOROUGH CHAMBERS is being erected for Mr. G. F. Harrington. The contractors are Messrs. Turtle & Appleton, of 141, St. John's Hill, London, S.W., and Mr. Reginald Morphew is the architect. The Jermyn Street and Bury Street frontages are faced with the best Portland Whitbed brown stone. The masons are Messrs. J. & A. Crew. The carving will be executed by Mr. Gilbert Seale, and Messrs. Homan & Rodgers are carrying out the fireproof floors. The suites of chambers are to be decorated with American yellow pine and the best Austrian oak. Bookcases and cupboards are to be built in the various recesses in the walls, and these rooms will be made as attractive as possible.—The Passmore Edwards Boys' Club and Fairbairn Hall was opened early in 1900. The club premises have a frontage towards Barking Road of 78ft. The plans on the opposite page show the accommodation provided, and the irregular shape of the site. The clubroom is lighted by two semicircular windows. The manager's office is separated from the room by a glazed screen, and is so situated that all persons passing in and out of the club are under the manager's direct supervision. The office also serves the purpose of a general enquiry office. A fireproof staircase leads from the back to a reading-room immediately overhead and a billiard-room on the floor above. This latter contains three full-sized tables and, in addition to the windows, is lighted from the top by a lantern running the full length of the room. A long seat upon a raised dais, it will be noticed, runs round the greater part of the room for the accommodation of spectators. Adjoining the billiard-room, and occupying the remainder of the top floor, is the caretaker's apartments. At the back of the main block on the ground floor is the large hall, known as the Fairbairn Hall. This will accommodate 280 persons. Most of the floors are covered with wood blocks, and the rooms are heated by hot water, several having open fireplaces in addition. Electric light is fitted throughout. The main front is of red-pressed bricks, with terra-cotta dressings and strings, as also the mullions and transoms of the windows. The cost of the buildings was about £7,900. The contractors were Messrs. James Smith & Sons, of Norwood, and the architect was Mr. H. C. Lander, A.R.I.B.A., of Effingham House, Arundel Street, Strand, W.C.

A Century of Desolation. "WE complain of vanishing Egypt, but it is not too much to say that if England were left uninhabited for a hundred years it would be practically impossible for historians to reconstruct our civilization. The railways would have rusted away. The bridges would have collapsed. The steamships would have sunk. The Crystal Palace would have come to resemble a deposit of fractured aërated-water bottles. The books would have, most of them, mouldered away. The adjectives of Marie Corelli would have flown to rejoin their long-forgotten originator. An occasional human bone, a large mound at the top of Ludgate Hill, some red, white and blue poppies near Downing Street, and a kind of acropolis in the middle of Birmingham, would alone remain to vary the monotony of endless greenery—probably shamrock—which would then cover England." There is, however, no saying whether the "Daily News" (from which the foregoing is taken) would still remain.

A Sign-Post. THE sign-post at Chessington, Surrey, illustrated on this page, was executed for a small wayside inn on the main Leatherhead Road. The drawing is self-explanatory. The design is by Mr. A. Jessop Hardwick, architect, of Eagle Chambers, Kingston-on-Thames, Surrey.

Newgate and the Sessions House. Instructions have now been issued by the City Lands Committee of the Corporation for pulling down the female wing at the Old Bailey, and it is hoped to shortly commence the demolition of the remainder of Newgate for the purpose of erecting the new Central Criminal Court. The female wing and the Sessions House have long been the property of the Corporation, and it is only that portion of the prison known as the male wing which is being acquired from the Government. Until the Brixton gaol is completed, the Government do not see their way to effect the transfer, but it is thought that very little further delay will take place. Immediately the City authorities get possession operations will be started on a large scale. There will probably be a bronze statue of Justice in the summit of the dome of the new Sessions House, and allegorical figures will ornament the main entrance. The walls will be of brick faced with Portland stone. It is the intention to make the courses of stone of the principal elevation of the same height as those of the existing walls, the object of this being to allow as much as possible of the old building to be used should the material be found to be sound. Since the acceptance of Mr. E. W. Mountford's design a few modifications have been introduced, and probably others will be made during construction. In connection with the cells, the requirements of the Home Office have been carefully followed. The present Sessions House will not be pulled down until some portion of the new building is finished.

A Literary Architect-Builder. A Mr. Charles F. Lumis, author and editor, has planned and built for himself on the outskirts of Los Angeles, California, a most strange dwelling. The walls are massive, 4ft. thick, built of boulders of every shape and colour. Unhewed girders of oak stretch between the walls and support a low flat roof, which is to be used as a promenade. The doors are hewed out of heavy plank, oddly grained, no two being alike, and placed without regard to symmetry; each door being hung on fantastic wrought hinges. The windows are of all shapes and sizes. A circular jagged tower rises above the roof to a sufficient height to give an unobstructed view of the landscape. On the upper floor of the house is the author's workroom, which is reached only by an outside stairway. It is one large room containing the library of rare and expensive books, documents, early works and prints, and a small ante-room at the stair head contains many rare relics of an early civilisation dating back to the Aztecs. In the living-room on the ground floor is a collection of art works, curios, relics, &c. All is odd; but the fact that the owner has been his own architect, stonemason, carpenter, painter—in fact, has done the "whole thing"—makes the effort interesting.

Sonning Bridges: An Interesting Letter. In defending his position with regard to the bridges across the Thames at Sonning and their proposed rebuilding (see p. 51 of our issue for September 3rd) Mr. Holman Hunt sends a letter from Mr. W. H. Thorpe, who says:—"My experience in the design and construction of bridges during many years, together with a considerable practice in examination and maintenance of old work, enables me to say with confidence that the order of durability is—masonry (including brick), cast-iron, wrought-iron, steel, timber, and the order of at least cost is generally for moderate spans—timber; masonry (plain), cast-iron, steel and wrought-iron (nearly equal). I have again and again known cases where local authorities, bitten with the mania for being 'up-to-date,' favour the construction of what is commonly in such cases called a 'nice light lattice girder steel bridge,' notwithstanding that a bridge in stone or brickwork would cost less, last longer and look better. I do not know the conditions at Sonning, but, broadly, I may say that for moderate spans steel should never be used if it is practicable to build in masonry or brickwork, on grounds of economy, present and future. With respect to the æsthetic aspect of the matter, I will admit that while I prefer the masonry or brick arch, or alternately the metallic arch—girder construction has not the same alarms for me as for some—there are beauties in good metallic construction which are entirely unappreciated by the average observer unacquainted with the art. . . ."

PASSMORE EDWARDS BOYS' CLUB, CANNING TOWN, E.
H. C. LANDER, A.R.I.B.A., ARCHITECT.

Keystones.

The Society of Architects.—Mr. Silvanus Trevail, F.R.I.B.A., J.P., president of the Society of Architects, has been invited to continue in office for the ensuing session, and has consented to be nominated for the second time.

Swanscombe Church.—The "Gravesend Standard" states that the architect, Mr Jabez Bignell, will be much assisted in restoring the screen by the measured drawing by Mr. Frank J. Waller, published on p 34 of our issue for August 27th last.

The Affairs of a Bexhill Architect.—The public examination was recently held of Mr. A. C. D. Hicks, architect, of Bexhill. His gross liabilities were £4,832, of which £532 was expected to rank. His assets were estimated at £302, leaving a deficiency of £255. The debtor attributed his insolvency to slump in value of property at Bexhill, and consequent bad debts, and competition. He started in business about twelve years ago.

St. Mark's Campanile. — The National Arts Club of New York has issued an appeal for American subscriptions in aid of the rebuilding of the Campanile in Venice, basing its appeal on the fact that for many generations Americans have received pleasure and benefit from the art and architecture of Venice, and that both public and private collections of works of art in Italy have long been freely opened to American students.

The Northampton Institute.—We have received a copy of the announcements of this excellent Institute for the session 1902-03. The evening courses and classes in all technological subjects will commence on Monday, September 22nd, and the day courses in engineering on Monday, September 29th. Among the special courses which have been arranged are the following:—Seven lectures for woodworkers, commencing November 5th (fee 1s. 6d.); six lectures on sanitation, commencing January 7th next (fee 1s. 6d.); three lectures on ironwork in buildings, commencing February 18th next (fee 1s.); three lectures on plasterers' work, commencing March 11th next (fee 1s.); five lectures on modern building practice, commencing April 8th next (fee 1s.). There are, in addition, the usual classes on architectural and building practice. Further particulars may be obtained from Mr. R. Mullineux Walmsley, D.Sc., F.R.S.E., principal of the Institute, St. John Street Road, Clerkenwell, E.C.

A New Baptist Church and Schools at East Finchley is being erected. The scheme consists of a church with nave and aisles and transepts and choir, with three vestries, the seating all radiating on a circular plan from the pulpit. Accommodation is given for 764 adults on ground floor (including seventy-two in end gallery), or a mixed congregation of about 870 persons. A tower is placed at the corner of church, which will stand at the corner of the Great North Road and Creighton Avenue. The schools, which have been opened, are two storeys high, and consist of a large hall with eight classrooms at the sides, partitioned off from each other by sliding panelled partitions so arranged that the whole school can be thrown open into one large hall for use as a chapel until the new chapel is erected, and one at the end opposite the platform. The galleries on three sides are to be used for classes. There are two large seniors' classrooms in the rear, and a large infants' room, &c., and kitchen. The buildings are faced in front with split flints with stone dressings. The architects are Messrs. George Baines, F.R.I.B.A., and R. Palmer Baines, of 5, Clement's Inn, Strand, London, W.C. The contract amount for the schools was £3,634.

A Statue of Queen Victoria is to be erected close to the Portsmouth Town Hall.

Haddington Church is to be restored, an anonymous donor having offered £7,500. A portion of the church is at present in ruins.

A Home for the Aged Poor and Infirm has been opened at High Barnes, Sunderland, by the Little Sisters of the Poor. The total length of the new building is 220ft.; its cost £14,000; and its accommodation from 150 to 200 persons.

The Catholic Church of St. Nicholas at Bristol, in Pennywell Road, has been re-opened, after undergoing re-decoration by Messrs. Webley & Sons, of Park Row, Bristol, at a cost of £280.

Art in Edinburgh.—The Secretary for Scotland has appointed Mr. Akers-Douglas, M.P., Sir John Stirling Maxwell, M.P., Sir Walter Armstrong, Director of the National Gallery, Dublin, Sir Kenneth Mackenzie, King's and Lord Treasurer's Remembrancer in Scotland, and Mr. T. R. Buchanan to be a committee to inquire into the duties of the Board of Manufactures, with special reference to the administration of the grants made by Parliament for the purposes of art in Edinburgh.

The Langho Asylum Competition.—The Chorlton and Manchester Joint Asylum Committee (Chorlton and Manchester Unions) have issued the decision with regard to the competitive designs for the new Asylum Colony for Imbeciles and Epileptics to be erected at Langho, near Blackburn. On the advice and adjudication of Mr. P. Gordon Smith, F.R.I.B.A., of Palace Chambers, Bridge Street, London, S.W., the assessor, they have awarded the three premiums as follows, namely:—First premium, £200, to design No. 38, authors, Messrs. Giles, Gough & Trollope, architects, 28, Craven Street, Charing Cross, London, W.C.; second premium, £150, to design No. 34, authors, Mr. Edward Page Howard, 39, Cursitor Street, London, W.C., and Mr. Ernest Richard Dolby, 8, Princess Street, Westminster, joint architects; third premium, £100, to design No. 16, authors, Mr. Joseph Smith (of Messrs. Cheers & Smith), Mr. Frederick John Parkinson and Mr. Walter Stirrup, 9, Richmond Terrace, Blackburn, joint architects. It is their intention to publicly exhibit the designs during the early part of the month of October. Where competitors have requested that their designs should not be so exhibited, they will not be included in the exhibition.

A New Board School at Vickerstown, Barrow-in-Furness, has been erected upon Walney Island for the children of the new town, being built by Messrs. Vickers, Son & Maxim. The total accommodation is for 648 children, and the buildings are of one storey, containing a central hall 65ft. 6in. by 33ft., and ten classrooms, with cloak-room and two teachers' rooms on the ground floor and large heating-chamber and store-room in the basement. The walls are built of bricks faced externally with Askam bricks to a height of 4ft., and above that with rough-cast in cement coloured a cream colour, and with St. Bees stone dressings. The roofs are covered with grey Walna Scar slates and red ridge tiles. Internally a dado 4ft. high of coloured glazed bricks runs round all the rooms and corridors, and the walls above this are plastered and coloured. The buildings are lighted throughout by electricity. The total cost of the work, including playgrounds, play-sheds and boundary walls, is £8,075. The contractors for the work are:—Excavator, bricklayer and joiner, Messrs. Clark & Robinson; mason, Messrs. G. Varley & Son; slater and plasterer, Mr. James Walker; plumber, painter and glazier, Mr. James Gell; ironfounder, Mr. W. Barrett. Mr. Henry T. Fowler, of Barrow-in-Furness, is the architect.

Builders' Notes.

Mr. James Dargie, builder, of Forfar, died last week. He built the Infirmary, the Reid Hall, and the Union Bank at Forfar, while in Arbroath he built the Poorhouse, and successfully carried out a large drainage system in connection with that town. He retired from business about twenty years ago.

The South Wales Building Trades Employers' Federation held its quarterly meeting last week at Pontypridd. The president (Councillor W. M. Blackburn, of Newport) presided. The new contract form, as drafted by the National Federation, was adopted. The new clause recommended by the National Federation for insertion in all new rules was discussed, and it was resolved that the Association be recommended to adopt it.

Mr. Charles Choat, builder, of Mildmay Road, Chelmsford, died recently at the age of sixty-eight years. Deceased started work with his father, Mr. Richard Choat, in Mildmay Road, Chelmsford, when he was twenty-one years of age, and of late years he had been assisted by his eldest son, Mr. C. W. Choat, who is now in charge of the business, which was originally started by Mr. Richard Choat in 1840.

The Peterhead Master Builders' Association held its annual meeting recently, Mr. A. Milne, engineer, president, in the chair. The accounts for the past year were submitted and passed, and the following office-bearers were elected for next year:—President, J. B. Dickie, builder; vice-president, W. Hadden, builder; secretary and treasurer, A. Clark Martin, solicitor; committee: Messrs. John Davidson, plumber; W. G. Calder, painter; James Taylor, jun., builder; W. Mackintosh, slater; John Stuart, plasterer; and A. L. Williamson, blacksmith.

Manchester Painters.—A deputation representing a large body of the organised painters in Manchester—including some 1,100 ratepayers—waited on the Watch Committee of the City Council last week and complained of certain painting work being done at the police and fire stations by policemen and firemen. They asked that such work should be given to properly qualified workmen, and suggested that the painters attached to the Town Hall staff should be employed. The request of the deputation was acceded to so far as the police stations were concerned, and the fire brigade sub-committee was asked to report with regard to the fire stations.

A Scaffold Accident occurred last week at the South Lancashire Tramways Co.'s electrical generating station at Howe Bridge, Atherton, resulting in the death of three men and serious injuries to three others. The works are now nearing completion. For the last few weeks Messrs. Klein & Co., a Manchester engineering firm, have been engaged in constructing a cooling tower, which, when completed, will be one of the largest in the country. A huge scaffold has been raised 20ft. above the concrete basement, and a platform was formed on top preparatory to carrying the staging another 40ft. higher. A derrick, with the usual blocks and chains, was used to raise the baulks of timber to the basement, and one afternoon last week seven workmen were employed in moving this from its position in the centre of the staging to a point a few yards further on. Lever and guide ropes attached to the top of the derrick were used for the purpose, and the work was apparently proceeding smoothly when suddenly a sound of crashing timber was heard, and without any further warning the centre of the huge wooden structure collapsed, carrying six of the seven workmen on the platform along with it in its fall.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

The "Builders' Journal" in France.

LIVERPOOL.—A. M. writes: "Has the BUILDERS' JOURNAL any circulation in France? I wish to get into correspondence with a French architectural student, to exchange ideas and practise the language."

The BUILDERS' JOURNAL has a small circulation in France, and can be obtained at Neale's Library in Paris. For your purpose it would, however, be probably better to address an enquiry to such a paper as "La Construction Moderne," 13, Rue Bonaparte, Paris.

Sketching Tour in Derbyshire.

LEICESTER.—STUDENT writes: "Kindly give some information about an architectural sketching tour taking the village of Hayfield in Derbyshire as a centre."

This part of Derbyshire is by no means rich in architectural work, and there is comparatively little that is worthy of study. In Hayfield itself is the church of St. Matthew, which was rebuilt in 1818. The present church stands on the old walls, and in the crypt, which was built in 1386, can be seen the lower part of the original nave piers. There is a splendid walk to Glossop from here. Glossop Hall, a fine building, is in the French château style of the eighteenth century. At New Mills, three miles from Hayfield, the Roman Catholic church of the Annunciation is worth visiting. At Chapel-en-le-Frith, which is about nine miles distant by rail, is the chapel of St. Thomas-à-Beckett, founded in 1225 and rebuilt in the eighteenth century. Mellor, 1¼ miles east of Marple Station, has the church of St. Thomas, which is mainly modern restoration, but its tower was built in the fifteenth century, and it contains a unique fourteenth-century wooden pulpit carved out of the solid. It is the oldest wooden pulpit in England. There is also an interesting Norman font, sculptured with rude incised figures, in this church. At Peak Forest (about twelve miles by rail) is a church dedicated to "St. Charles Kinge and Martyr," and built in 1660. Castleton is worth a visit, containing the church of St. Edmund, which, however, has undergone so many restorations and repairs that little pre-restoration work remains, but a fine Norman arch separates nave from chancel, and the tower is of late fifteenth-century work. The ruins of the old castle of the Peverels lie to the south of the town. The great architectural monuments of Derbyshire, such as Haddon Hall, Chatsworth House and Tideswell Church, apparently lie outside the district referred to in the question. G. A. T. M.

Construction of Chimney Stack.

LONDON.—VOLTA writes: "It is proposed to line the upper 20ft. of a large electricity station stack with firebrick bonded in. Is this in accord with modern practice? The electric engineer says it is useless—not more than 1 in 20 stacks have been so built during the last thirty years." He also adds that in Lancashire many mill chimneys for large boiler power are only half-a-brick thick at the top."

I have never heard of a case where the top of a large chimney shaft was lined with firebrick; it is certainly most unusual. Nowadays firebrick lining is not bonded in, but built as a separate wall with an air-space between it and the outer main walls. It is not usually carried up more than 25ft. in small stacks or 50ft. in large stacks. The top 20ft. of a stack is usually 9in. thick, increasing by 4½in. every 20ft. downwards. When the stack is more than 250ft. high the top length should be 14in. thick. When the inside diameter does not exceed 3ft. and the height is not more than 75ft., a thickness of 4½in. for the top length might be sufficient, but nothing less than 9in. is usual in London. HENRY ADAMS.

An Architect's Will: Disposal of Practice.

LONDON.—H. E. W. writes: "In the case of an architect making his will, what is the usual way in which he would direct his executors to dispose of his practice for the benefit of his wife and family, supposing that he leaves no professional partner, son, nor anyone in particular to carry it on? What would be fair terms to offer to anyone disposed to take over the practice, and what proportion of profits might be reasonably expected from him in favour of the widow and children, both in regard to the completion of work actually in hand at the time of the architect's death and also to any that might come into the office within the next two or three years? In the case of a practice being sold outright as it stands, is the goodwill reckoned as being two or three years' purchase of the average income of the past three years?"

The wording of a will is such a personal matter that it is exceedingly difficult to give advice. Probably it would be best to hamper the executor as little as possible, merely directing that the goodwill of the business, office furniture, instruments, drawings, account books and records of all sorts be disposed of, and the proceeds paid over to the selected beneficiary, the will being drawn up by a solicitor. A letter addressed to the executor might be deposited with the will making a few suggestions to him as to how to proceed in selling the business, and this would be an especially wise course to adopt if the executor know little of architectural practice, but it should be carefully worded so as not to tie his hands should he see a better way. It might, for example, be suggested to him that the practice be immediately advertised as for sale in this and other professional journals, that all negotiations should be carried on through solicitors, and that an accountant be called in to draw up a proper balance-sheet. A few hints as to the way in which the books have been kept might also be useful, and an intimation as to the price which might reasonably be asked. Generally speaking, the sooner a business is disposed of after a death the greater its value, and it is better to sell for a lump sum than to make a profit-sharing arrangement. As no good introduction can be given, it is unlikely that much more than one year's purchase could be realized, unless appointments bringing in definite incomes could be handed over, and these should realize three years' purchase. The executor should send in bills to the clients closing all accounts to the date of death or to the date of handing the business over to a successor—the executor in this case conducting it in the interim; for it is impossible to bind a client to go to your successor for completion of works in progress however probable it may be that he will do so. At the same time, letters should be sent with the bills explaining the circumstances under which they are rendered and introducing the successor. Letters of introduction ought similarly to be sent to all other clients whose addresses can be found. If the books have been properly kept, with indices of drawings and address-books of clients and possible clients, not only is the executor's task rendered much easier, but a much higher price can probably be obtained than otherwise. Most important of these details is proper book-keeping, with balance-sheets audited by an accountant at regular intervals, extending regularly over many years. G. A. T. M.

Architects as Valuers: Licences.

BATLEY.—INQUIS writes: "If an architect or a builder is asked to make a valuation of damage done by fire to any building for insurance claims or for the purpose of borrowing money on a mortage, does he require a licence, and if so, what nature of licence should he take out and what is its cost?"

An appraiser's licence (cost £2 per annum) must be taken out by any person acting as a valuer. If "Inquis" acts without this licence he is liable to a penalty of £50, but in any case he would not be able to recover his fees by an action, as the fact of his not having a licence to act would be considered a valid defence in law. W. E. D.

The Trade Custom as to Squares of Boarding.

BIRMINGHAM.—F. N. S. writes: "How many super. ft. should thirty squares of matchboarding cover? My timber merchant says they always measure the tongues, that is to say, if I ordered thirty squares of ¾in. by 6in. matchboards, I should only get 200 running feet of boards that cover only ¾in. by 5½in., which takes 218 1/11ft. to the square. Is he right?"

Your timber merchant is quite correct. It is the trade custom to measure and sell prepared boardings at per square of original dimensions, without any allowance for loss in conversion. To the timber-merchant a square of 6in. by ¾in. deal rough boarding, a square of 6in. by ¾in. deal boarding wrought both sides and edges shot, and a square of 6in. by ¾in. deal matchboarding represents the same number of running feet in each instance, notwithstanding the fact that in the case of the 6in. wrought boarding there is a loss of 1/46th of actual covering capacity (the finished boards being then only about 5¼in. wide); whilst in the case of the matchboarding the loss of covering capacity is, of course, considerably greater, owing to the additional quantity absorbed in forming the tongue. When estimating the amount of prepared boarding required to cover a given area the builder must therefore make provision for any reduction in covering capacity which may be caused by the use of any particular description or width of prepared boarding as compared with its original width before being prepared. A similar custom applies generally to all wrought or prepared woodwork, unless expressly stated to the contrary. For example, it is usual to allow for a loss of 1/16in. for each wrought face, so that what is ordinarily known as a 2in. door or a 2in. board wrought both sides will only measure about 1⅞in. in actual thickness when finished. T. E. C.

Divisions between Adjoining Properties: Dilapidations, &c.

CHERTSEY.—QUAERO writes: "(*a*) Where there is no hedge, but a mound and ditch as shown on the accompanying sketch (not reproduced), where does the division line of the properties come? (*b*) When surveying for dilapidations and the margin or whole of the floor has been stained and varnished or polished, can this be required to be re-done, assuming the covenants to be strict and to embrace decorative work, such as papering, whitening and painting? (*c*) Are Venetian blinds to be included in the paintwork of a room under covenants such as the foregoing? (*d*) In settling dilapidation for a money payment, where it is admitted that walls must be repapered, can stripping be insisted on, or only sizing and preparing the old paper?"

(*a*) In the absence of any measurements which would enable the exact boundaries of the properties to be ascertained, custom generally fixes the division line at a point

COTTAGES AT MADRESFIELD COURT, MALVERN LINK, WORCESTERSHIRE. C. F. A. VOYSEY, ARCHITECT.

equi-distant from A and B, *i.e.* at a point halfway between the commencement of the ditch and the commencement of the mound. (*b*) In face of strict covenants for dilapidations, I am of the opinion that staining and varnishing the margin of the floor, or the entire floor, as the case may be, is reasonable. (*c*) Unless specially included as a fixture, and consequently a part of the freehold, I am of the opinion that the repainting of Venetian blinds does not come under a covenant for dilapidations, as such blinds do not form an integral part of a room and therefore would not come within the scope of a covenant affecting the room as such. (*d*) If the walls were papered direct on the plaster at the time the party against whom dilapidations are sought to be recovered took possession, then I am of the opinion that they will have now to be put in a similar condition, *i.e.* stripped and papered on the plaster; if however the contrary was the case it would be unreasonable to insist on stripping them, and the dilapidation as to papering should be assessed on the cost of papering over the existing paper. W. JOHNSON-ROBERTS.

Payment for Extras.

LLANELLY.—J. T. writes: "Some time ago I gave an estimate for additions and alterations to a house. I had orders to proceed with the work and it is now finished. There were many extras, which amounted to £14 4s. 6d.—nearly as much as my original estimate. The owners say they will only pay me £9 4s. 6d. What course should I take? My estimate was about £2 too low: can I claim this amount?"

You do not make it quite clear whether the amount in dispute is for extras alone or partly for substitutions in place of items in the original contract. Having made a contract you cannot now claim for the £2 which you omitted in your estimate, and we consider the clients are entitled to a rebate for anything estimated which was omitted, according to the terms of the estimate, notwithstanding that the omitted items may be those for which the £2 extra should have been charged. The account should be made up by deducting from the original tender all the amounts for work omitted and for which other has been substituted, and then charging the extra work as materials and labour. If your clients will not pay, send a lawyer's letter requesting immediate payment, and if then no adequate payment is made, sue for the amount in the county court.

S.K. Building Construction Examination.

NEWCASTLE-ON-TYNE.—STUDENT writes: "Which is the best book to study for the South Kensington Examination in Building Construction, Honours Part I.?"

See an answer on the subject of the South Kensington Examinations on p. 233 of our issue for May 28th last. A new edition of Mitchell's Elementary Stage Building Construction has just been published by Mr. B. T. Batsford, which has been greatly enlarged to meet the requirements of this examination.

Books on Masonry and Skeleton Steel Construction.

SHEPTON MALLET.—ENQUIRER writes: "(1) Where can I get information on details in stonework suitable for public buildings, &c.; also (2) information on steel construction for high buildings?"

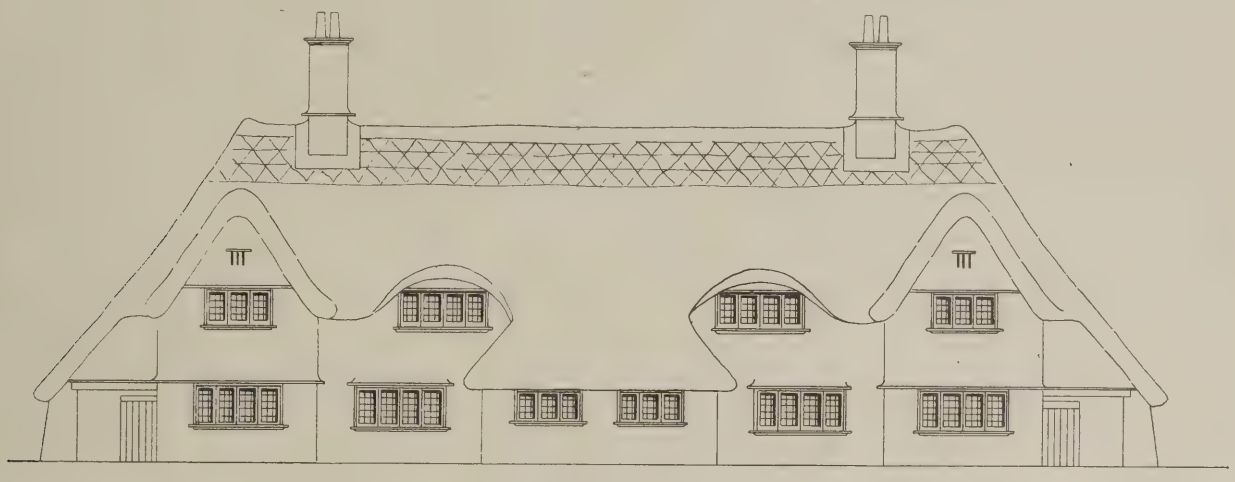
(1) "Practical Masonry," by William R. Purchase (6s. nett), and "Architectural Examples in Brick, Stone, Wood and Iron," by William Fullerton (15s.). (2) "Skeleton Construction in Buildings," by W. H. Birkmire (12s. 6d. nett). These books are obtainable from Mr. B. T. Batsford, 94 High Holborn, W.C.

Books on Brick-making.

LONDON, W.C.—W. E. H. writes: "Kindly give the titles and prices of the best books upon the subject of brick-making, especially the latest works giving the most up-to-date methods of making bricks, both by machinery and by hand, and explaining the nature and composition of brick earth."

"Bricks, Tiles and Terra-Cotta," by T. C. Davis (price 21s.), is a comprehensive book, but Edward Dobson's "Bricks and Tiles" (price 2s. 6d.) is a good elementary treatise on the subject.

TWO COTTAGES AT MADRESFIELD COURT

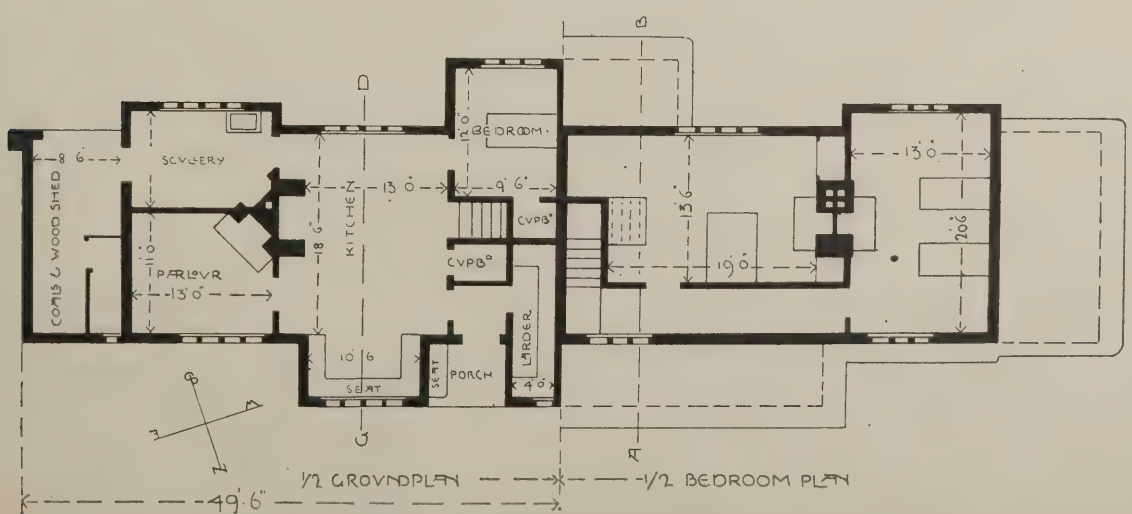


THESE two cottages are proposed to be built for the Right Hon. the Earl Beauchamp, K.C.M.G., in brick cement rough-cast and thatched with reeds with marram grass ridges; all the joinery to be in oiled oak. The perspective is a rough sketch done by Mr. Voysey without rule or measurement.

Surveying & Sanitation.

"Women as Sanitary Inspectors."—This is the title of a leaflet published by Messrs. P. S. King & Son, 2 and 4, Great Smith Street, Westminster (price ½d.), for the National Union of Women Workers. It gives a short account of the history of the movement, and then briefly enumerates the duties of women inspectors in workshops, laundries and tenement houses, as well as furnishing some particulars of the notification of infectious diseases and the training of sanitary inspectors.

Westminster Paving Scandal.—With the object of vindicating its action in connection with this subject, the Westminster Municipal Association (formerly the Westminster Ratepayers' Committee) has issued an elaborate pamphlet illustrated by photographic reproductions of the wood blocks employed, and including an account of the various proceedings in the King's Bench Division of the High Court of Justice and in the Court of Appeal. The hon. secretary of the Association is Mr. James MacConnell, 8, Regent Street, Waterloo Place, S.W.



Doulton Ware at Health Congress Exhibition.—At the Health Exhibition held in connection with last week's congress of the Sanitary Institute at Manchester, Messrs. Doulton & Co., Ltd., showed a large variety of sanitary fittings. Among the closets those for works and schools were specially noticeable. One pattern consists of separate basins connected to one pipe fixed below the ground level, flushed by an automatic tank so that at one discharge the whole range is cleared; the action is syphonic and each basin is isolated. There was also a special low closet for children, on the wash-down principle with syphon cistern. A syphonic closet, certain and quiet in action with a good water-area, as well as a new valve closet with open overflow, were also exhibited. For drainage work a new automatic syphon was shown which will work with liquid sewers as well as clear water, acting with drop-by-drop supply. The baths were of different designs and included both ordinary plunge as well as shower and spray fittings. They were all vitreous enamelled inside, and in one or two instances outside as well—this ensures a perfectly smooth, glossy and lasting surface. Most of the lavatories, sinks, urinals, &c., and especially those for hospital use, were of strong white-glazed fireclay, which is strong and lasting and has a well-glazed surface; in many cases the ironwork used with it is vitreous enamelled, so that all exposed parts can be washed down. A mortuary table attracted attention. The slab was 6ft. 6in. long by 2ft. 6in. wide, dished and deeply grooved to one end. It was fixed on a vitreous enamelled centre column arranged to move on ball bearings, so that the top might be easily turned to any angle and then retained in that position by means of a simple check fitting. Another speciality was a sink for infectious hospitals, one pattern being worked by treadles and another by self-closing valves.

COTTAGES AT MADRESFIELD COURT, MALVERN LINK, WORCESTERSHIRE. C. F. A. VOYSEY, ARCHITECT

THE SANITARY INSTITUTE CONGRESS.

IN our last issue we published Earl Egerton's inaugural address to the Congress of the Sanitary Institute at Manchester, which congress continued throughout the whole of last week.

Municipal Sanitation.

On Wednesday a conference of municipal representatives was held in the Large Hall of the Municipal School of Technology. Mr. Alderman M'Dougall, vice-chairman of the Sanitary Committee of the Manchester Corporation, who presided, said he thought members of public bodies might be encouraged by the increased confidence felt by the general public in the value of sanitary precautions and regulations. There was strong encouragement also in the earnest and combined efforts on the part of sanitary authorities to obtain additional powers to simplify and extend their activities. That was especially the case in dealing with insanitary dwellings and the provision of houses for the working classes. Mr. M'Dougall made reference to the work done in Manchester in the direction of the prevention of the pollution of the atmosphere by smoke and in dealing with insanitary houses. During the past fifteen years, he said, under the powers of a local Act about 7,300 of such houses had been made habitable, the cost being principally borne by the owners and the portion contributed by the Corporation being not more than £25,000.

Amending and Consolidating the Public Health Acts.

The Public Health Acts in regard to sewers and drains were very unsatisfactory, as by the various decisions in the law courts a very considerable cost was thrown upon the rates which ought, in equity, to be borne by property-owners. This was a matter which required the urgent and immediate attention of all municipal authorities. In Manchester alone during the last six years £39,367 had been charged to the city rates, the greater portion of which ought, in justice, to have been borne by property-owners. The Municipal Corporations Association should be requested to urge upon the Government the necessity for amending these Acts.

Mr. W. H. Wells (chief sanitary inspector, Newcastle-on-Tyne) read a paper also advocating the reconstruction and consolidation of the Acts and proposing a resolution to that effect.

Dr. Boobbyer (Nottingham), the recording secretary of the Conference, said that when he brought the resolution before the council of the Institute he would do his best to impress upon that body the unanimous feeling of the conference with regard to the matter.

The 1901 Factory Act.

The medical officers of health met in the Chemical Theatre at the Owens College, under the chairmanship of Dr. Niven, medical officer of health for Manchester. Dr. A. Greenwood (Blackburn) read a paper on "Defects in the 1901 Factory and Workshop Act." He said a defect of the new Act was that it failed to place the sanitary control of factories under local authorities. Under the Factory Act the medical officer of health had no right of entry into a factory, but must wait until the factory inspector forwarded his notice, which was often sent first to the clerk to the local authority and then handed to the medical officer of health.

A conference of engineers and surveyors was held in the Chemical Theatre of the School of Technology. Mr. C. Jones (borough engineer of Ealing), who presided, in his opening address traced much of the sanitary progress of the last fifty years to losses sustained by the Royal Family, losses which, he said, stirred the minds of people to the necessity of taking steps to improve sanitary arrangements. He spoke of some of the ideas that had been put forward in the half century and that had proved fallacious, and yet, he added, these ideas were not useless, because better methods had been based upon the so-called failures. The advance in processes for the treatment of sewage was quoted as an instance. In another part of his address the president spoke of the changes that had taken place during his own experience in connection with the municipal engineer, his training and his duties.

Methods of Sewer Ventilation—Natural, Artificial, Deodorization.

Dr. W. F. Dearden, chairman of the Special Committee of the Manchester Corporation *re* ventilation of sewers, read a paper on sewer ventilation, in order, as he said, "to get to know something about the subject" for the benefit of Manchester. Dr. Dearden presented a summary of the present condition of things. All methods, whether in actual use or only advocated, could be classified, he said, under the three headings of natural ventilation, artificial ventilation and deodorization. Speaking first of the principle of providing fresh air in such sufficiency as to render the sewer air practically similar to that outside, Dr. Dearden said that of sixty towns which had supplied his committee with particulars twenty-eight pinned their faith to surface grids, although twenty of these had found it advisable to erect a few shafts under special circumstances. A modern sewer, placed in a broad street, should under ordinary circumstances give little trouble with the surface grid in proper operation, but there were objections. It was a common belief that several of the zymotic diseases could be communicated to persons who had been kept in too close proximity to a street grid. This belief should either be proved correct or its fallacy exposed, and it was the intention of the Manchester Committee to have fresh bacteriological experiments made to ascertain the comparison, bacteriologically, between the air of sewers and that to be found in the streets outside. The character of the sewer air emitted from surface grids as a disease-spreading agency was the factor to take into consideration before any of the numerous authorities who have so extensively utilised this system could justify themselves in making an entire change of scheme. Twenty-three of the sixty towns effected their ventilation by a combination of surface grids and high shafts. Experiments at Leicester had proved that this was no ideal way of attaining the end in view. In four towns the drains were disconnected and the sewers ventilated solely by high shafts. These shafts were satisfactory for the purpose aimed at. From a municipal point of view, however, the main point for consideration was whether the cost and utility were quite proportionate. Dr. Dearden asked if there was sufficient evidence of the danger of surface grids to justify a corporation in making so radical a change at so great a capital outlay as would necesssarily be entailed; and he then briefly described the methods of artificial ventilation and of deodorization by the suspension of "pyrozone" blocks beneath the grids and the fitting of air filters and deodorants.

Mr. Alfred M. Fowler also read a paper on sewer ventilation. He urged that to guard against the contingencies of deposits in the sewers and the effluvia arising therefrom it was both desirable and necessary to provide ventilation, so that sewer air might be diluted with as much fresh air as possible and passed off as far away from the inhabitants as practicable. Mr. Fowler referred to the ventilation system recently invented by Mr. Shone as based on scientific and quite original principles. A mechanical fan is the initial power, and the process is to draw continuously into the sewer a given quantity of fresh air. Concerning upcast shafts Mr. Fowler said his experiments had shown successful ventilation, but it had not been in the absence of street surface ventilators.

Mr. J. F. Price (Birmingham) spoke of the difficulties that had to be dealt with in towns where there was no perfect type of drainage and where there were many old sewers of which there was no knowledge. An artificial system of sewer ventilation for Birmingham, he said, would cost £125,000, and if it were provided he did not think it would be absolutely perfect.

Mr. Whyatt stated the difficulties of sewer ventilation at Grimsby, where one-fifth of the town is below high-water level.

Mr. Grimshaw (Manchester) suggested the judicious employment of ventilation openings—few in the crowded districts, and a greater number where the air-space was greater.

Dr. Nash, Dr. S. Rideal, Mr. Price (Lytham), Mr. Brodie (Blackpool), Mr. Mawbey (Leicester) and Mr. Parker (Hereford) joined in the discussion.

Mr. J. Corbett, the borough engineer of Salford, read a paper in which he described a new sewer-scouring machine of his own invention. The machine is intended to pulverise and loosen deposited silt, and its work is to be supplemented by flushing to carry the loosened silt down the sewer. The chief value of the machine is in the economy which its use will exercise as compared with the practice of sinking frequent holes to silted sewers and clearing with hand labour.

Professor Archibald Sharpe read a paper describing the ways in which motor vans may be employed in municipal work; and Mr. W. H. Hamblett, of Salford, gave a paper on "Refuse disposal and destruction."

A conference of ladies to discuss hygienic questions and the application of hygienic principles to everyday life was presided over by Mrs. W. O. Meek at the Owens College.

On Wednesday evening, at the Whitworth Hall, Dr. W. N. Shaw gave the Congress lecture upon "The Treatment of Smoke: A Sanitary Parallel" (given at length in another part of this issue, see p. 71).

Sir Alexander Binnie on Water Supply.

Sir Alexander R. Binnie (London), president of the Engineering and Architectural Section, said the cleanliness and sanitation of the large towns had greatly improved during the last forty years, and there had grown up in the public mind a conviction that it was only by rigid enforcement of proper sanitary regulations that the public health could be preserved. An advance had been made by endeavouring to conform to the great laws of nature governing the removal of dead organic matter and the preservation of the purity of air and water.

Personally he still held the belief that a water supply should be not only pure and uncontaminated, but beyond suspicion of any possible pollution whatever. "In recent years," Sir Alexander continued, "I fear that a little laxity, due probably to our improved sewage purification, is creeping in, and that we find large populations supplied with water which has received directly or indirectly many sewage affluents. From this I draw the conclusion that either our large towns, such as Edinburgh, Glasgow, Manchester, Leeds, Liverpool, Bradford, Birmingham and many others, have uselessly expended millions of money in attaining an ideally pure water-supply, or that the people of London are running a great risk in continuing to depend almost entirely on the waters of the Thames and the Lea, which receive the more or less clarified sewage effluent of over a million and a quarter persons. I am inclined to believe with the late Sir George Buchanan that large populations can continue to drink water which has been contaminated with apparent impunity, but that sooner or later such water

takes on itself morbific qualities which lead to death and disease." Respecting pure air and fogs Sir Alexander said that no doubt a great improvement was effected by proper drainage, but when towns or cities were situated in large river-valleys such as the Thames and, like London, with one-tenth of the area below high-water level, it was unreasonable to expect that fogs could be abolished, however much could be done to alleviate the dirt and misery caused by them, by a proper and economical use of fuel. What really was required was a cheap and economical heating gas. This was not an impossibility. With electricity for the internal illumination of our houses, with gas fuel for heating and cooking purposes, and a cheap incandescent gas lamp for street use, he felt certain that great improvement could be made in the air of our towns.

On Thursday a paper was read by Mr. E. George Mawbey, M.I.C.E. (Leicester), on

The Sanitation of Road Traffic,

in the course of which he said:—Dr. S. Rideal has already made some bacteriological experiments to ascertain the number of organisms present on the asphalt paving in Victoria Street, Westminster, and also to test to what extent the bacteria can be destroyed by street watering, adding permanganate of potash of certain strengths of solution. The menace to health by the fouling of the surfaces of the streets of our towns is an established fact, and this is combated by scavenging and watering at a considerable cost to the community. At Leicester more than £10,000 per year is expended on this work, 18,000 tons of sweepings being annually collected from the roads and streets of the borough.

In the very best cleansed towns the first washings of streets which reach the drains and sewers are very foul, and in all streets but those with practically impermeable paving a portion of this foul liquid obviously soaks down, and in many towns there are large areas of stone-paving bedded and racked up or jointed in gravel or other very permeable material. It can hardly be denied that such a pervious stratum of material, consisting of old stone paving macadam, and even soft wood-paving, is polluted to an extent which no sweeping, watering or washing can remedy. It is also obvious that such a polluted stratum forms a fruitful culture-bed for bacteria.

The practice adopted in some places of using the dirty and polluted scrapings off macadamised roads in towns for binding material for the re-coating of such macadamised roads, instead of clean new or washed material, is to be most strongly deprecated. I would urge the extension of the system of thoroughly washing street pavements, and the carrying-out of street sweeping during the night time, preceded by efficient watering. In Leicester "pyrozone" blocks in the water carts are used as a disinfectant, and there is no evidence of the drawbacks which have been attributed to the use of permanganate of potash.

The financial aspect of this problem is the most difficult of solution. Tar-paving, which, I believe, is being recommended by Mr. E. Purnell Hooley, the county surveyor of Nottingham, would be an excellent step in the right direction in substitution of ordinary macadamised roads, where its first cost and maintenance can be met.

Mr. H. D. Searles-Wood, F.R.I.B.A., read an important paper on "Means of Escape in Case of Fire": this we are obliged to hold over till next week.

Mr. Clayton Beadle (Sidcup) read a paper on "The Abstraction of Underground Waters and its Local Effects," in which he sought to show that rainfall deficiency could not be made to account for the drying up of many of our rivers, and that pumping had a material effect upon the flow of many springs and rivers.

Mr. L. Hanks (London) read a paper on "Sanitary House Decoration," which, from want of space, we are also obliged to hold over till next week.

Papers on Sanatoria were read by Mr. Edwin T. Hall, F.R.I.B.A., Mr. W. Cecil Hardisty, and Mr. W. S. Cross, F.R.I.B.A. and Dr. A. G. Welsford, which papers we shall also publish in another issue.

A New Sterilizer.

Dr. Henry E. Armstrong described an apparatus for the disinfection by steam of the excreta in cholera and enteric fever, devised by Mr. W. G. Laws, city engineer of Newcastle, and himself: a sterilizer which has given satisfaction at Newcastle Each apparatus consists of a pan of 30 gals. capacity, placed in an annexe to the offshoot for the ward conveniences. Leading into it are the waste-pipes from the water-closet and slop-sink, their outlets into the pan being governed by a three-way cock, which also controls the outlet pipe from the sterilizer. Steam is conveyed into the pan by two separate pipes, one of which (sterilizing) reaches to the bottom, the other (ejecting) ends inside the cover of the pan. The *modus operandi* is as follows:—When the pan is about two-thirds full an electric bell, operated by a float on the surface of the liquid contents, rings to call the attendant, who closes all of the valves. The sterilizing cock is then turned on, and steam entering at the bottom rapidly raises the temperature to about 250 degs. Fahr. After maintaining this temperature for fifteen minutes, which is ample for the sterilization of the liquid, the sterilizing steam cock is closed and the steam ejecting cock is opened. Shortly afterwards the outlet valve is opened, when the whole of the liquid is at once discharged into the cooling tank and the pan is washed out. A charge can be dealt with every half hour, thus allowing the sterilization of from 200 to 250 gals. daily from each ward, an ample provision for twenty patients.

Mr. J. P. Wilkinson, A.M.I.C.E., gave a full description of the new works for the biological treatment of the sewage of Manchester, summarized particulars of which were given by Earl Egerton in his inaugural address (see p. 67 of our last issue).

The Cost of the Manchester Experiments.

Mr. Gilbert J. Fowler, of Manchester, gave a resumé of the Manchester experiments, from chemical and bacteriological standpoints. He pointed out that the drainage area of Manchester, including Audenshaw and Stratford, was 11,800 acres. The population coupled up to the sewers was estimated in March, 1902, at 564,000, and the ratable value for sanitary purposes was £3,523,000. The cost of treatment per million gallons of sewage by the precipitation method for the year ending March, 1901, amounted to £1 9s. 8½d. The cost of chemical treatment and sludge disposal was from £11,000 to £13,000 per annum. Sludge disposal cost 12s. 1·6d. per million gallons and precipitation 8s. 8d. He believed there were certain times and certain conditions where chemical treatment followed by filtration was a suitable process.

Effluents from Works.

A paper was contributed by Mr. J. Hubner (director of the Dyeing Department of the Manchester Municipal School of Technology) on the treatment of effluents from bleach works, dyehouses, print works and paper mills. He said community of interests would seem best protected by community of action; yet enormous sums of money had been, and were still being, expended by individual firms on the erection and maintenance of plant for the purification of waste waters from works of the kind mentioned. Greater economy of working would attend co-operative action by bleachers, dyers, calico printers and paper makers in a matter of such importance as the treatment of their effluents. The establishment of well-equipped laboratories, and the employment of a staff of highly-qualified chemists and engineers, would entail but a trifling expenditure by each firm concerned, whilst under the conditions at present prevailing the profit-earning of individual concerns might be seriously affected by heavy expenditure upon the investigation of methods of effluent treatment.

Prof. Henry Robinson, M.I.C.E., read a paper on

The Biological Purification of Sewage,

in the course of which he said:—

In the year 1884 I was instructed to endeavour to treat the sewage of a town upon an extremely small area of land, without incurring the expense of chemical precipitation. I constructed a chamber with an iron grating near the bottom. On this grating I placed layers of stones of various sizes and the crude sewage passed upwards, the bulk of the suspended matter in the form of sludge being arrested. This was pumped out at intervals and disposed of on farm land adjoining. I found that the solids thus arrested became liquefied and the resultant fluid gave better agricultural results than had previously been obtained from crude sewage. I arrived at the conclusion that the liquefaction of the solids was due to a cesspit action having been set up in the interstices of the stones, whereby the first putrefactive change was effected and the subsequent further treatment, either on land or otherwise, facilitated. Since that time I have had to advise with reference to works where both anaërobic and aërobic chambers have been employed, and I have obtained excellent results by anaërobic action with interstices. I am quite aware of and desire to recognise the fact that good results are being obtained by cesspit or septic action without such interstices.

As regards aërobic action there are several ways in which impure effluents from sewage works can be purified. My opinion on this point may be stated in the words that I employed at the Conference on Water Supply and River Pollution over which I presided last October: "Where sufficient land is not available, or where it is unsuitable for sewage disposal, then the further treatment of the liquid in aërobic beds enables any required standard of effluent to be attained. Inasmuch as the purification of foul fluid by aërobic action is dependent on aëration, it would appear best to subject the fluid constantly to exposure to the air. This would be better effected when the liquid trickles over open surfaces of hard stone, clinker, or other material in the aërobic beds than would be the case were the beds worked on the intermittent system, namely, first filled, then emptied, and then left to rest. I am aware that difference of opinion exists on this point, and prefer to keep an open mind on the subject at present."

I have stated that the material placed in bacteria beds should be of suitable quality, as this is an essential to success. I have had to examine beds which have been pronounced complete failures, owing to the fact that they were filled with all sorts of most unsuitable material, which inevitably caused an early choking of the interstices. I have also seen sewage applied to beds without the necessary arrangements having been provided for arresting inorganic and other matters before the admission of the fluid to the bed. Any works will be failures if the necessary conditions for success are not observed.

At the closing general meeting of the congress, held on Friday at Owens College, the secretary reported that the total attendance had been 2,100, including 759 delegates, 750 members of the Institute and 100 ladies; 250 complimentary tickets had been issued.

Engineering Notes.

Electric Tramways at Richmond.—The London United Electric Tramways system has been extended from Twickenham to Richmond, and is now opened for traffic. It is now possible to travel from Richmond to Hammersmith or Shepherd's Bush by electric car.

Indian Steel.—Mr. Tatta, of Bombay, a Parsee millionaire, has completed a scheme for working the enormous deposits of iron ore in the Central Provinces. He has the support of the Indian Government in the enterprise, which is arousing great excitement, as it is believed that with its cheap labour India will be in a position to supply the world with steel.

An Accident at the Tay Bridge, Dundee, occurred last week. A number of painters were engaged on the structure painting the high girders. To do this they had to stand on a car which ran on rails. Boisterous weather prevailed, and the inspector, fearing an accident would result, gave orders to the gang to cease work. This was done; but before the men had time to leave a terrific gust of wind struck the car, sending it with great speed along the line. Frantic efforts were made by the men to stop the vehicle, but without success, and, the wheels leaving the metals, the men were thrown off. Alexander Falconer and William Howie fell into the river, 80ft. below, and were lost; but the others saved themselves by catching hold of different parts of the bridge and escaped with minor injuries.

Tenders.

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, *Effingham House, Arundel Street, Strand, W.C.*

Bellericay (Essex).—For constructing sewers, manholes, lampholes, &c.; also for construction of outfall works, tank and filters, and irrigation at Brook Street, South Weald, for the Bellericay Rural District Council. Mr. John Simmons, engineer, Doncaster:—

Raynor	£2,295 18
Hayward, Grays	2,251 0
Marsh, Orsett Heath	2,250 0
White, Romford	2,169 0
Harris & Rowe, Shoeburyness	1,900 0
J. Jackson, Forest Gate	1,850 0
Wilson, Border & Co., Ilford	1,835 0
W. Manders, Leyton	1,799 16
Thompson & Wilkinson,* Upminster	1,781 0

* Accepted.

Doncaster.—For supply, delivery and fixing of an ejector condenser plant, with all necessary pumps, piping, &c., at the Corporation Electricity Works, Doncaster, for the Corporation. Mr. W. Wyld, borough electrical engineer:—

T. Ledward & Co.	£1,213 0 0
Korting Brothers	1,095 5 0
Klein Engineering Co., Manchester	1,075 0 0
Geipel & Lange,* Parliament Mansions, Westminster, S.W.	1,069 10 9
R. Morton & Sons	1,051 0 0

* Accepted. [Rest of London.]

Dukinfield.—For the sewering, &c., of the following streets, for the Corporation, namely, Crescent Road, Old Road, Ashton Street and Bridge Eye district. Mr. Samuel Hague, borough surveyor:—

Crescent Road and Old Road.

L. Beddows & Co., Pendlebury	£1,868 9 0
G. Wilde, Dukinfield	1,296 16 0
Etheridge & Clark, Manchester	1,083 11 0
W. Underwood & Brother, Dukinfield	1,061 3 0
W. H. Worthington,* 59 Rusholme Road, Manchester	944 13 0

King Street and Wharf Street.

L. Beddows & Co.	£1,082 9 0
W. H. Worthington	380 18 0
G. Wilde	290 3 3
Pryke & Hayward, Poulton-le-Fylde	288 11 8
Etheridge & Clark	216 0 3
W. Underwood & Brother*	195 2 0

Ashton Street district.

L. Beddows & Co.	£1,084 13 6
W. H. Worthington	567 14 3
G. Wilde	557 12 0
Etheridge & Clark	543 13 0
Pryke & Hayward	535 19 6
W. Underwood & Brother*	493 1 0

Bridge Eye district.

L. Beddows & Co.	£483 10 0
W. H. Worthington	299 4 6
Pryke & Hayward	296 19 1
Etheridge & Clark	281 9 6
G. Wilde	272 7 0
W. Underwood & Brother*	252 2 6

* Accepted.

Frinton-on-Sea.—For additions and alterations to Beach House, Frinton, for Mr. R. P. Cooper, J.P. Messrs. Homer & Son, architects, Frinton, and 35 Bucklersbury, London, E.C.:—

H. Potter	£3,750	E. Mills	£2,769
G. D. Collins	3,179	R. Moore*	2,402
P. H. Oxley	3,125		

* Accepted.

Gosforth.—For making-up the following streets, for the Gosforth Urban District Council:—(Contract No. 1) Purcell Street South, Purcell Street North, Dunn Street, Chapel Street, South Street, West Street, Lambert Square (part of), Wall Street, Mary Agnes Street, John Street, Coronation Street and back streets, &c.; (2) Ashburton Road (part of), Ashfield Road, Wolsingham Road, North Avenue (part of), Broomfield Road, Mayfield Road, Woodbine Road (part of), Woodbine Avenue (part of), West Avenue (part of), Hawthorn Road (part of), Gordon Avenue (part of), Causey Street (part of) and back streets, &c.; (3) Spittal Terrace (part of), Rothwell Road (part of), Alwinton Terrace (part of), Bath Terrace (part of), Harley Terrace (part of), Woolley Terrace (part of), Beaumont Terrace (part of), Hyde Terrace (part of), and back streets, &c.; (4) Rectory Road (part of); Stoneyhurst Road (part of), Balmoral Terrace (part of), Windsor Terrace (part of), Sandringham Road (part of), Audley Road (part of), William Street, and back streets, &c. Mr. C. J. Baff, surveyor:—

Contract No. 1.

Wardlow, South Shields	£3,494 0 4
Thompson, Gosforth	3,092 1 9
Appleby, Embleton, Northumberland	3,072 17 6
Edgar Brothers, Heaton, Newcastle-on-Tyne	3,052 4 4
Robson, Newcastle-on-Tyne	2,971 18 7
Hollings, Burnside, Wallsend	2,919 17 11
J. McLaren, Gosforth	2,856 15 6
T. & R. McLaren, Woodside, Christon, Bank, Northumberland	2,796 13 6
Simpson,* Newcastle-on-Tyne	2,378 6 8

[Surveyor's estimate, £2,937 14s. 6d.]

Contract No. 2.

Wardlow	£3,923 14 10
J. McLaren	3,417 1 7
Thompson	3,397 18 5
Edgar Brothers	3,379 8 6
T. & R. McLaren	3,322 7 7
Appleby	3,319 10 0
Robson	3,092 11 10
Simpson*	3,072 1 2
Hollings	2,337 15 9

[Surveyor's estimate, £3,480 3s. 6d.]

Contract No. 3.

Wardlow	£2,130 9 8
Edgar Brothers	1,980 17 3
Appleby	1,913 19 0
T. & R. McLaren	1,874 4 9
Robson	1,847 16 0
Thompson	1,825 15 9
J. McLaren	1,823 18 4
Hollings	1,778 9 6
Simpson*	1,769 7 1

[Surveyor's estimate, £1,826 3s. 6d.]

Contract No. 4.

Wardlow	£2,385 10 11
Hollings	2,030 1 0
Edgar Brothers	2,051 11 10
T. & R. McLaren	2,041 18 3
Appleby	1,972 0 4
Simpson	1,969 6 7
Thompson	1,930 5 4
J. McLaren	1,859 15 6
Robson*	1,849 8 7

[Surveyor's estimate, £2,069 12s. 3d.]

* Accepted.

London.—For repair of internal roads at the Gore Farm Hospital, for the Metropolitan Asylums Board:—

R. Ballard, Ltd., Child's Hill, N.W.	£5,732 10 0
T. Free & Sons, Maidenhead	5,651 7 9
H. Woodham & Sons, Sangley Road, Catford, S.E.	5,089 0 0
T. Adams, Green Lanes Goods Station, Wood Green, N.	4,612 15 2
Road Maintenance and Stone Supply Co., Ltd.,* Gravesend	4,544 2 1
J. Meston,† 60 St. Mark's Road, North Kensington, W.	4,330 18 3

* Accepted. † Withdrawn.

London.—For the erection of workshops in Hollybush Gardens, for Mr. J. Joseph. Mr. Edward Brown, architect, 150 Minories, E.C.:—

W. G. Brown	£1,378 19
Johnson Brothers	1,218 10
Bishop	1,185 0
H. Hood*	1,130 0

* Accepted.

London, E.—For the erection of new warehouses in Durward Street, Whitechapel, for Messrs. Kearley & Tonge, Ltd. (sub-structure). Messrs. William Eve and Sons, architects, 10 Union Court, Old Broad Street, E.C.:—

Foster & Dicksee	£2,015	Patman & Fotheringham	1,633
Holloway Brothers	1,785	Harris & Wardrop,* Wallwood Street, Limehouse, E.	1,549
Perry Brothers	1,687		
Killby & Gayford	1,663		
Nightingale	1,639		
F. & H. F. Higgs	1,624		

* Accepted.

Lowestoft.—For the erection of Baptist Schools, Grove Park, Lowestoft. Messrs. George Baines, F.R.I.B.A., and R. Palmer Baines, architects, 5 Clement's Inn, Strand, London, W.C.:—

W. Knights	£2,040 12 9
J. Welham	1,812 10 0
R. C. Todd	1,799 0 0
G. Elsey	1,710 0 0
Bedwell & Parker	1,690 0 0
C. R. Cole	1,670 0 0
C. E. Earl*	1,466 17 0

* Accepted with modifications.

An Architectural Causerie.

The Albert Memorial.

The colouring of the mosaics of the Albert Memorial has always been the most pleasing feature of that gilded bird-cage, apart from the sculpture groups arranged around the base. These mosaics, however, are now being renovated, as well as the Memorial itself; and it is expected that £8,000 will be spent on the work. A necessity no doubt: but one thinks what might be done with even £8,000 in the hands of a really capable architect. Sir Gilbert Scott's design is doubtless admired by nine out of every ten visitors, and as one has become accustomed to the repetition of such misdirected admiration in the daily press, it is somewhat alarming to see the Memorial so severely criticised by the "Daily News." The writer has little respect for "the mean gilded ironwork" which "represents almost the nadir of British architecture": and thinks that the late Prince Consort's memory was never more unfortunately served than by the erection of "a fragment of railway station in Kensington Gardens." Scott was the author of many enormities, but such criticism as this is extravagant and unjust. It may, however, tend to dispel in some measure the popular appreciation of an undeserving work.

A Small Priory Church.

The illustration on this page shows the interior and a small sketch plan of a priory church designed by Mr. Charles H. M. Mileham and proposed to be erected for a religious community in a large town. It is intended that the walls shall be built of concrete with rough-cast external face, and as far as means will allow the interior will be faced with stone and paved with hardwood and marble; vaulted in concrete and covered with pantile roofs. The drawing was exhibited in this year's Royal Academy Exhibition.

The Apotheosis of Soot.

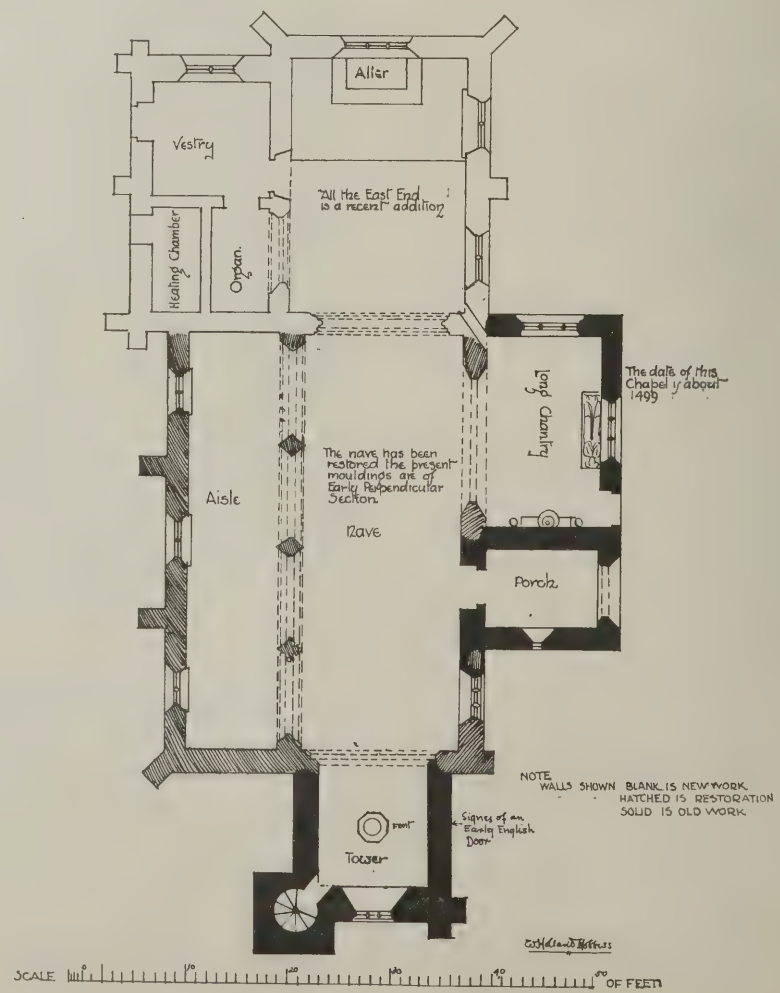
Buildings are not intended to be left to themselves and the elements: they cannot last for ever, but it is the duty of those who have charge of them to check the action of time by constant and intelligent supervision. This may seem trite, but it is nevertheless a truth which is rarely observed; for the common practice is to allow buildings to go to rack and ruin and then to "restore" them. With domestic houses, sufficiently looked after at least by legal covenants, we are not now concerned; it is public buildings to which we refer, and more especially public buildings in London.

As one example out of scores, take the Houses of Parliament. At the present moment the sheltered carvings and other embellishments on the outside of the building are clogged with dust and dirt; the English rose, which the carver chiselled so carefully, is encased with sooty particles which, in the hollows, collect into blotches. There may be those among artists who prefer the carvings in this condition, and these same persons would perhaps also admire a piece of mildewed cheese. For our own part we have no liking for soot or mildew, and Mr. Mortimer Menpes's contention (made in his "World Pictures") that "London by rights should be placed in the hands of the poet and the artist" hardly appeals to us. Mr. Menpes would have us "imagine rose-red, brilliant white, and palest-green houses seen through a silver-grey mist," but past experience would incline us to conjure up a vision of soot-encrusted houses seen through a sickly fog. But what we are now concerned about is no question of taste nor of expediency; it is one of sober necessity. If it were the intention to let the Houses of Parliament rot away as they will, then we could find no reason for urging the removal of all the dirt and soot on them; but as this is not the fact—everyone being desirous of preserving Barry's work as best may be—then why in the name of common-sense is all this filth allowed to collect on the stone, eating away its decoration and gnawing into its very heart? Would it not be better if the building had been swept down every year, or at least such parts of it as are within easy reach—there are soot-clogged carvings not much above the helmets of the policemen who walk past them, policemen who guard the national and civic interests; but there is no such constant watchman over the buildings themselves, else we should not have to deplore all these soiled enrichments. It were better, we say, if the buildings—and, indeed, all such buildings in a city like London—were swept

down at regular intervals; the soot and dirt of a year is a comparatively thin deposit which might easily be removed, but, when it is allowed to remain, the second year's deposit comes and the third, and so on till the whole stone is fouled and its surface crumbled into shapelessness. Now, of restorationists we have had enough. But there would be little work for them to do if better care were taken of our buildings, and first among many duties—first because most direct—is this of removing the dirt of a smoky atmosphere. The stain of time is one thing, rather it is a lovely colour that men cannot give to their work; but the foulness of soot is another, a thing to abhor rather than to admire. Maybe, with the advent of the air-ship the practice we advocate will become common, so that it will be no strange sight to see a band of workmen brushing the sides of a great building as they slowly encircle it in their heavenly craft. There is, however, no need to wait till every firm of decorators has its air-ship; there are brushes enough now and men enough to use them if only those in authority would give up this apotheosis of soot and have the filth swept away.

Metal Sheets for Decoration. It is an increasing custom in America to cover the fronts of houses with metal sheets stamped to represent stone and brickwork. We had occasion some time ago to refer to this baneful custom, but now we find the "South Wales Daily News" advocating its adoption here, or at least advocating the use of stamped metal sheets for internal decoration; and only a few weeks ago Sir John Jones Jenkins at the annual meeting of the Swansea Royal Metal Exchange referred to this trade as one which might enable Welsh tinplate manufacturers to make up in some measure for the orders that have gone across the Atlantic. So popular have these sheets become in America that distinct new classes of workmen have sprung up, under the names of metal ceiling hangers and painters. If they are found suitable and economical, there is no reason why our walls should not be covered with sheets of metal as with sheets of paper, but it is to be regretted that the manufacturers of these metal sheets abuse their material so much and produce designs of such atrocious character: and, moreover, that instead of dealing honestly with the metal, they should try to make it look what it is not. An American trade paper of repute says: "It is to the credit of the manufacturers in this line that they are educating the public taste by the exceptionally handsome and artistic designs in which they are offering their products." We have seen some of these designs and they are about equal to the stampings on cheap tea-pots. And there's the pity of it, because they at once become prejudiced in the eyes of persons of taste and a deep injury is done to what might be honest and reputable goods.

Sonning Bridges. — Commissioned by "Country Life," Mr. E. L. Lutyens has prepared some suggested designs for the rebuilding on the Sonning bridges. Oak is employed with stout piles. The designs are published in this week's issue of the paper.



A TOUR IN SOMERSETSHIRE AND WILTS.

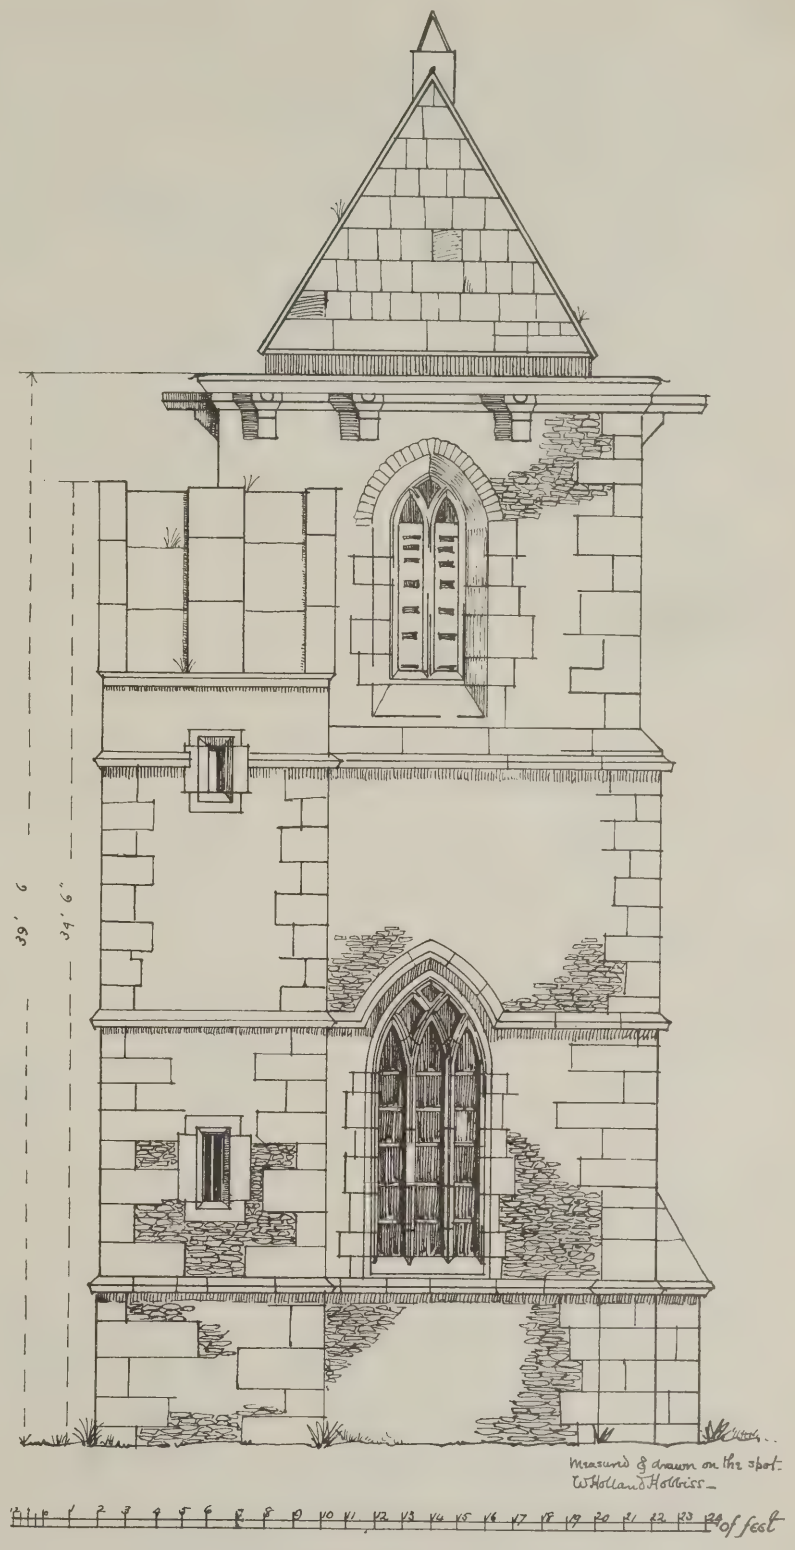
By W. HOLLAND HOBBISS.

ALMOST due west of Bath for a distance of six miles into Wiltshire we cycled until we reached South Wraxall. It is summed up in a church, an inn, a post-office, a farmhouse or two, and some straggling cottages; but to the architectural student, especially one with an artistic temperament, every building abounds with interest; and they are all so appropriate that one could almost fancy they had sprung up with the hedge-rows and grown to ordered maturity with the trees. Nor is South Wraxall in any sense unique, for wherever we went in Somerset or Wilts we saw the same quiet irregular street, with its grey lichen-covered houses breathing the very spirit of the simple country life; the square church tower, almost invariably of Perpendicular date, with the tombs of the gentry and the chantry of the lord of the manor, a screen and often a well-carved wooden roof.

The church at South Wraxall, as seen from the road, is dominated by its tower (see accompanying illustration), which has evidently been frequently restored. The lower storey shows signs of Early English work, but the saddle-back roof, the cornice and the buttress are of course much later, perhaps as late as the seventeenth century. The plan of the church is one common to the district, with a single aisle on the north side and the porch and chantry on the south. The Long chantry chapel was originally founded by the lord of the manor in 1499. It contains one tomb of about that date, supposed to be that of the widow of the founder. The church has been much restored—the chancel is in fact quite new, and where the modern mason has laid his hand here the "glory has effectually departed."

About two miles from South Wraxall is Chalfield manor-house (the country folk call it "Charfield"). Crossing the moat which surrounds it we entered the original courtyard, now a well-kept lawn. The building itself, which dates from the sixteenth century, stands on the site of a much older erection. There still can be traced the outer walls of a defensive house, and the moat undoubtedly belonged to the older building. The antiquarian would find a store of very interesting data, upon which he could determine the plan of the old building. What remains of the present manor-house has been very much altered to suit modern requirements. Some parts of it have been pulled down; for instance, I was surprised to find that the rooms behind the left wing had been removed, leaving only the front wall standing. The buildings on the western side of the court still remain and are used for what they were probably intended, namely, stables and rooms for servants, while beyond these again has been built a farmyard, of which a great stone barn is well worth seeing. The east side has been removed with the exception of the chapel, which, although an isolated building, I have little doubt was formerly the family chapel. Its position on plan indicates it as being such, and the period corresponds with the house, except that it is naturally more ecclesiastical in character, but the carving and the window tracery are similar in both. A stone screen, very beautiful in detail and carved with the arms of the family, with indications of colour decoration, still remains as part of the older period. An aisle was added in the eighteenth century, and the

PLAN OF SOUTH WRAXALL CHURCH.



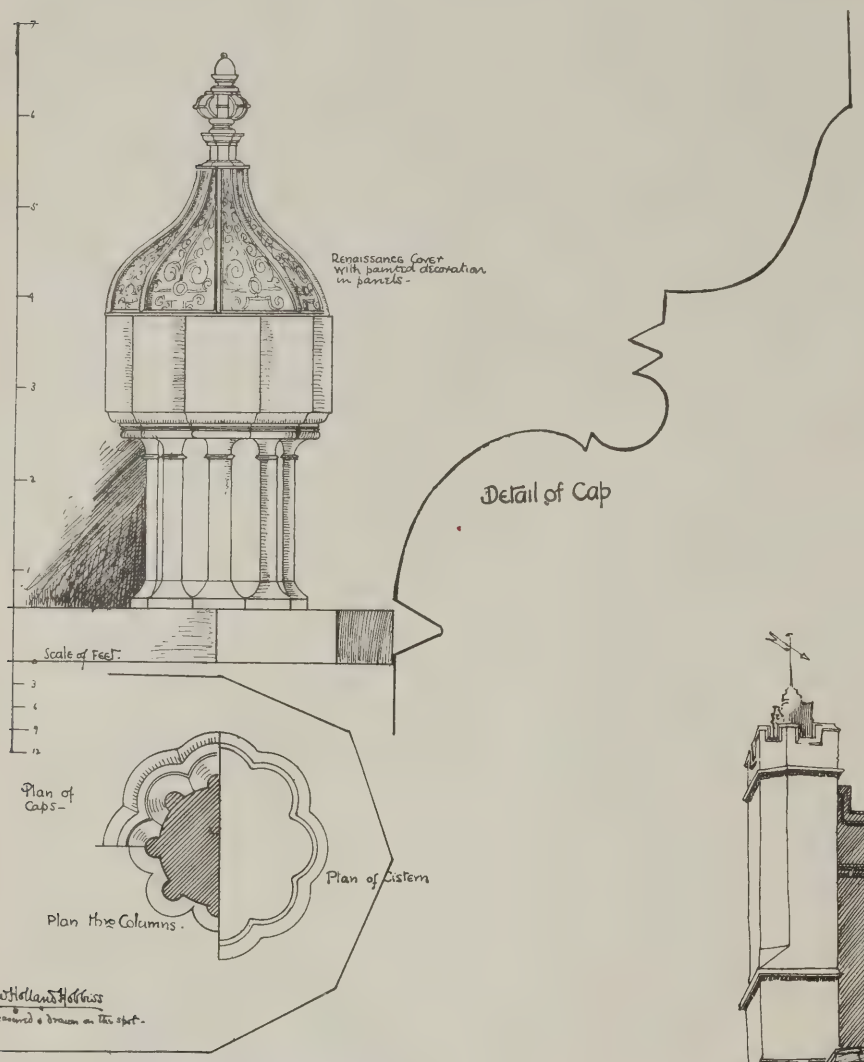
pews and pulpit (see p. 91) are of about the same date; this I presume was done when the lords of the manor abandoned the residence, the house itself then being turned into a farm and the chapel into the parish church. Turning again to the house and examining the detail, I was much struck with the Italian influence which, as Mr. Gotch says, was struggling with the Gothic tradition of the time. Although the manor has been built entirely in accordance with the English traditions, with pointed window-and door-heads, yet in its detail the foreign influence crept in. There is an attempt at symmetry in the disposition of windows, and the gables balance one another (see sketch on p. 96). The soffit of the oriel window has been scalloped in the Italian manner, although the English mason could not refrain from introducing a trefoil. The statues on the finials and elsewhere are full of movement.

Bradford-on-Avon was our next place of pilgrimage. There are some places which one instinctively feels to be very old—their position, their people and their streets all bear the mark of old-time history. Such a place is Bradford-on-Avon, with its crooked, narrow, steep little streets, its bridge, its churches, its mills and its old-fashioned wharves. One ot the few remaining Saxon churches is to be seen here, very much patched, but sufficiently good for the purpose of study.

The later Bradford Church is somewhat big and, like the churches of this district, mostly of Perpendicular date, but it has suffered from over-restoration. There is a Norman window in the chancel, and also a fragment of a Crusader's tomb that gives a clue to its early date. The plan of the church is similar to that of South Wraxall, *i.e.*, a single aisle on the north, a porch and a chantry chapel on the south, and a tower at the west end. The timber roof is the most interesting feature in the building; the chancel roof is the original work, that over the nave being a restoration.

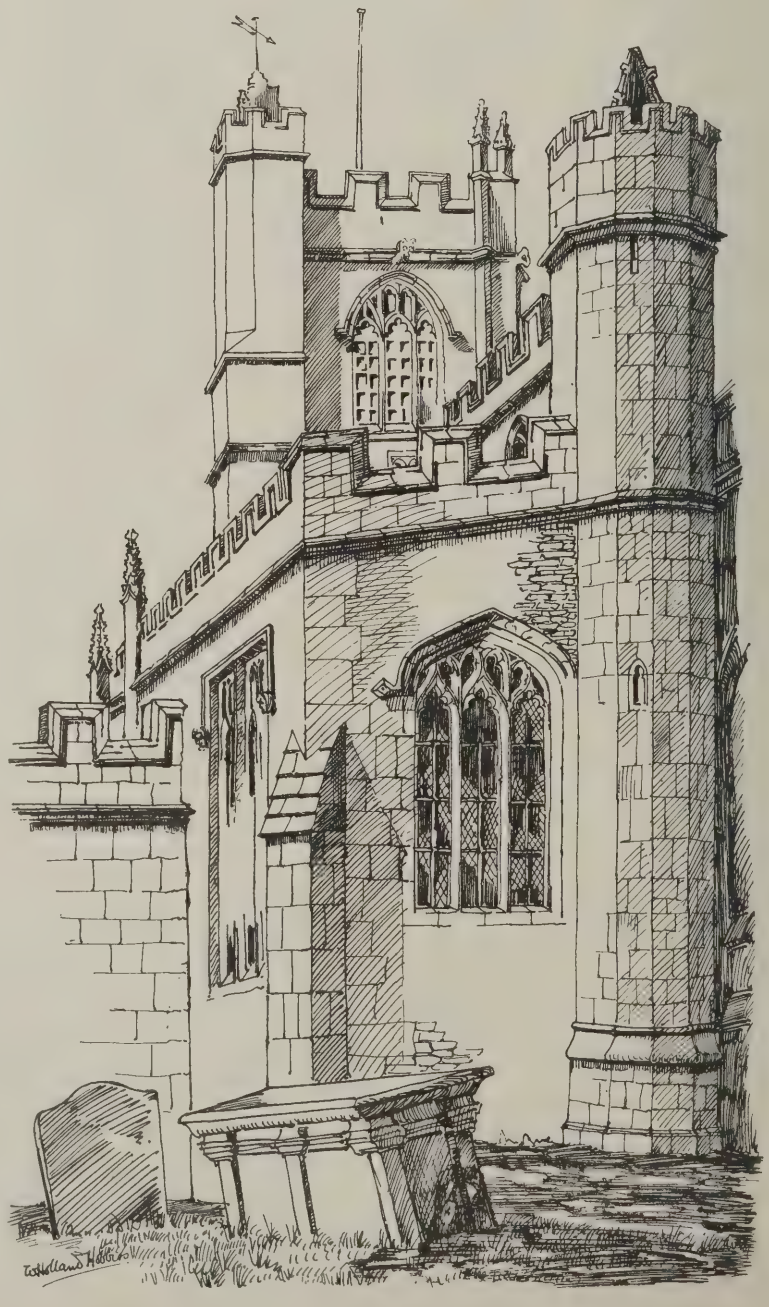
The boast of Bradford is its tithe barn. This building, which as an old countryman informed me, "is the second gurtest in England, surr," stands in a farmyard a little way out of Bradford. It is built of local stone with a light-pitched stone-tile roof, and has two entrances. The original trusses still remain, and the place has not changed since the old monks of the neighbouring monastery collected fat tithes from the farms and manors of that rich country-side in the thirteenth, fourteenth and fifteenth centuries.

After having seen all there was to see in Bradford-on-Avon we set off for a village called Westwood, about a mile and a half away. This village is divided into two parts, called Upper and Lower Westwood. In Upper Westwood we found an eighteenth-century house, or rather a seventeenth-century house with an eighteenth-century facing (see illustrations on pp. 92 and 93). It was originally a manor, with the stables a short distance from the house. The back has a very different appearance to the front, comprising three gables with a long mullioned window. Inside there is a rather pleasing staircase. The measured drawing of it on p. 95 is sufficiently explicit, and I need only say that the work is very quiet and refined; perhaps a little severe, and more adapted for the town than the country. Work of a similar character is to be seen at a village called Freshford, about a mile and a half up the valley. The walk from Westwood is one of the most charming in the Western counties. Upon one side rises a wood, and upon the other a bank of pasture land, and between these two banks there is a sweep of level land. Probably in some prehistoric ages it was the bed of a mighty river or glacier, but now all that remains is a quiet little stream, shaded by weeping willows and covered with beds of water-lilies, where here and there in the depths a big pike may be seen slowly moving,



TOWER OF SOUTH WRAXALL CHURCH.

the shallows and pools being alive with smaller fish.



Lower Westwood, architecturally speaking, has its attractions. There is a row of cottages worth studying. The manor-house (see sketch on p. 91), like many similar buildings in this part of the country, has been much altered, but still retains a great deal of interesting seventeenth-century work. A plastered ceiling in what is called the banqueting-room is an excellent subject for a measured drawing. As regards the village church, the tower is the best part of it, but inside the student will notice some rather interesting tombs showing signs of colour-work: beyond this, however, the building is of little valu to an architect.

From Westwood we journeyed through Hinton and so to Wellow. The cottages and walls here are all in good repair and the hedges are neatly trimmed. The church stands upon the highest piece of ground in the village and its tower is a prominent feature for miles. Again we have Perpendicular work. The tower is finely proportioned and is supported by some substantial angle buttresses with a three-light belfry window, the lights being filled in with stone louvres. There is a western door into the church through the tower with a four-

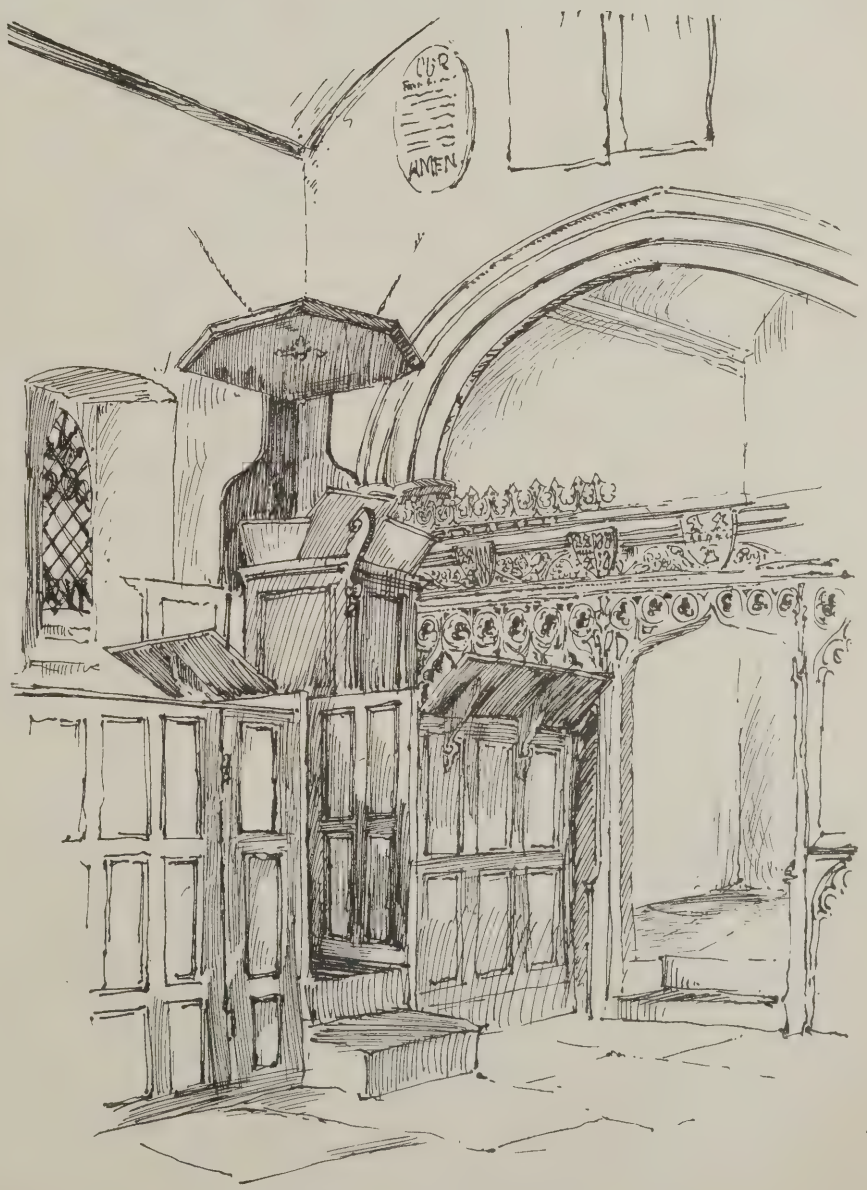
EARLY ENGLISH FONT IN WELLOW CHURCH, SOMERSETSHIRE.

centred head and a square label. The aisle windows are flat-pointed, almost Tudor, while the porch on the south side is piled up with buttresses and pinnacles on the angles; in the apex of the gable is a niche filled with a statue of the patron saint, St. Julian. The nave has a clearstory of three-light windows. The tower, aisles and nave are all embattled, and rainwater is (or, rather, was) carried from the roof by splendidly-carved gargoyles. The chancel is a recent addition; in it the architect has quite caught the spirit of the old work. I learnt afterwards that this addition was made by Messrs. Bodley & Garner, so we had the advantage of comparing good old with good modern work The interior of the church presents a singularly mediæval appearance. The original pews are still used, and a fine timber roof spans the nave. It differs from the other churches that we had seen in that it has two aisles, with the tower at the west end. A curious feature is that there is not a straight line in the building. The nave arches are all of different sizes. There is a very beautiful painted wooden screen between the chancel and the nave. The soffits of the chancel arch and of the arch to the Hungerford chantry (on the north side of the chancel) are panelled. The chantry is particularly interesting. It was built for the remains of the founder of the church, one — Hungerford, first Speaker of the House of Commons. The tomb of his wife is exceedingly elaborate. It is Italian in manner, with Ionic columns at each end supporting an entablature; in between these columns and supporting the entablature is an arcading, the architraves being worked with the guilloche pattern and the frieze ornamented with a series of small blocks, one recessed and the next projecting. The recumbent figure of the lady lies on the pedestal, which is divided into panels the outer of which are occupied by the effigies of her twin-children, while a coat-of-arms fills the centre. The tomb is surmounted with an ornamental coat-of-arms of Jacobean character. Originally there was a good deal of colour used, but now only fragments of it can be seen. The whole of the eastern wall of the chapel is covered with a colour scheme of some sort, but unfortunately it is hardly traceable. An industrious Owen Jones student would be repaid by a visit to Wellow Church. The font (see accompanying sketch) is Early English, and although so simple in design looks very well. The cover is of Renaissance character and an ornament is painted upon it frequently seen in Italian pilasters. I cannot pass without making a further reference to the chancel. If the outside has

WELLOW CHURCH, SOMERSETSHIRE, FROM THE EAST.

LOWER WESTWOOD MANOR-HOUSE. DRAWN BY W. HOLLAND HOBBISS.

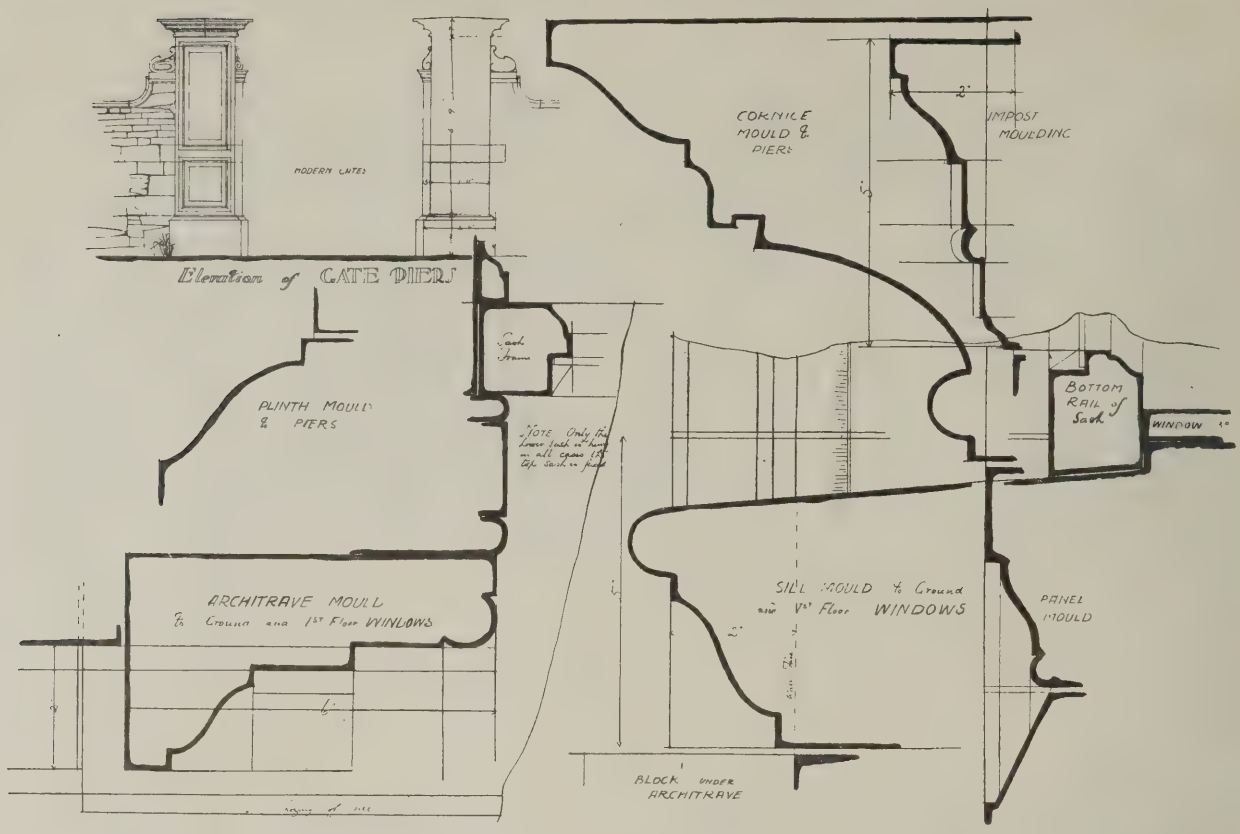
partaken of the spirit of the old work, the interior has doubly done so under the hands of Messrs. Bodley & Garner. It looks as though some long-forgotten guild had raised itself, with its master-mason, master-glazier and master-carpenter, from under those grey tombstones to complete the work it had begun four hundred years ago. The work is refined and scholarly, and the carving is clean and well-designed. A western window is filled with some good modern glass and the close-timbered roof is well treated and executed. The whole building is a standing evidence of what can be done when the architect is in sympathy with his work and the builder knows his business.



The manor-house at Wellow is a distinctly interesting building. The front elevation is simple enough, but the back is more pretentious with a courtyard, entrance porch and gabled roof. One of the rooms inside is oak panelled to the ceiling and is enriched with a Jacobean mantel-piece in a very good state of preservation.

About three miles from Wellow is Norton St. Philip. Here is another church well worthy of study. But we preferred to make some sketches of a rather more romantic building, "The George Inn" (see p. 94). This old half-timbered house is more picturesque and historical than architectural. It was here that Monmouth slept on the night prior to the fatal battle of Sedgemoor. The house was used by many royal and celebrated personages when travelling in that part of the country, from the thirteenth century onwards. The yard at the back has a decided old-world appearance. An open corridor flanks one side, from which lead sleeping chambers, while the other sides were occupied by stables. The corridor served the purpose of a gallery in a theatre, as from it the guests could watch the performance of the travelling mountebanks in the yard below.

We visited many other villages of lesser note, amongst which were Farley and Hungerford with ruins of the castle and chapel.

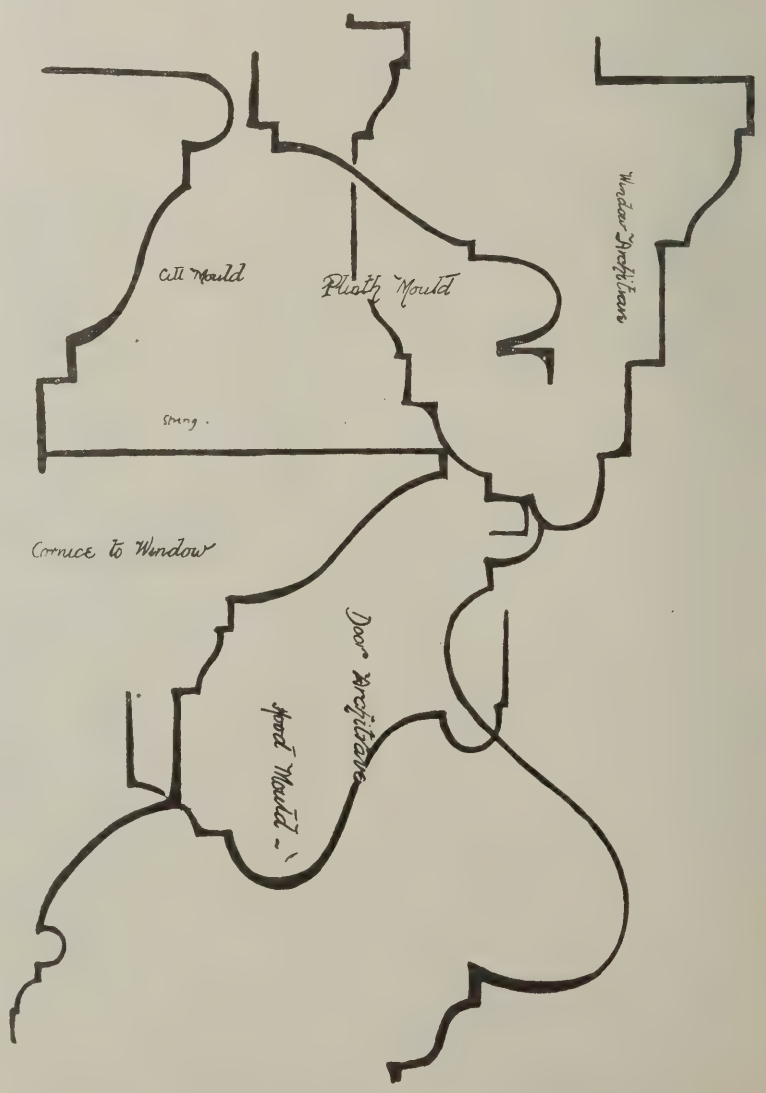


At Peasedown is a complete modern church by Messrs. Bodley & Garner. Hinton too is interesting. In fact, wherever a few cottages are clustered together there is sure to be found something worth seeing.

A holiday rather than a study—in this account I have not attempted any detailed description. It is merely a series of impressions such as you may get in wandering

PULPIT AND SCREEN IN CHALFIELD CHAPEL, WILTS.

B.



DETAILS OF EIGHTEENTH-CENTURY HOUSE AT WESTWOOD, WILTS. MEASURED AND DRAWN BY A. DENNIS THACKER.

about as we did; supplemented by a few of the many sketches which were made whenever eye and hand were drawn by the simple yet delightful architecture of these two English counties.

FIRE TEST WITH ROOFS.

PUBLICATION No. 72 of the British Fire Prevention Committee relates to a test with a slated roof and ceiling, and a flat roof covered with Vulcanite roofing and ceiling. The test lasted one hour, the temperature reaching 1,700 degs. Fahr., followed by the application of water for three minutes. Each floor was 100ft. super., and four weeks were allowed for construction and drying. The slates were "American green," measuring 20in. by 10in. by $\frac{3}{16}$in. thick, with a 2½in. lap, and the ridge covered with blue Staffordshire ridging. The laths were of sawn spruce 1¼in. by ¼in. Gutters lined with No. 14 gauge (Vielle Montagne) zinc. The Vulcanite roofing was covered with 2½in. of gravel and sand. The following is a summary of the effect of the fire:—In fifteen minutes the plaster to the ceiling of the slated roof began to fall; in twenty minutes the inside of this roof was well alight; in forty minutes the plastering of the Vulcanite roof began to fall; in forty-one minutes the slates on the other roof began to fall, and in forty-seven minutes the whole of the slate roof collapsed; while in fifty-four minutes the underside of the Vulcanite flat was a sheet of flame, but after sixty minutes the fire had not passed through it, and it was sound enough to be walked upon. In a "note" on this test Mr. Ellis Marsland says: "I think it will relieve the minds of London district surveyors of any doubt as to a roof of this construction being as fire-resisting as an ordinary slated roof."

A Stained-Glass Window has been erected at St. John's Church, Heselden, near Hartlepool. It has been executed by Messrs. Wailes & Strang, of Newcastle-on-Tyne.

DETAILS OF EIGHTEENTH-CENTURY HOUSE AT WESTWOOD, WILTS.

THE BRITISH ASSOCIATION.

CONCLUDING PAPERS.

THE BRITISH ASSOCIATION concluded its annual meeting at Belfast on Wednesday last: a report of its proceedings during the previous week was published in our last issue.

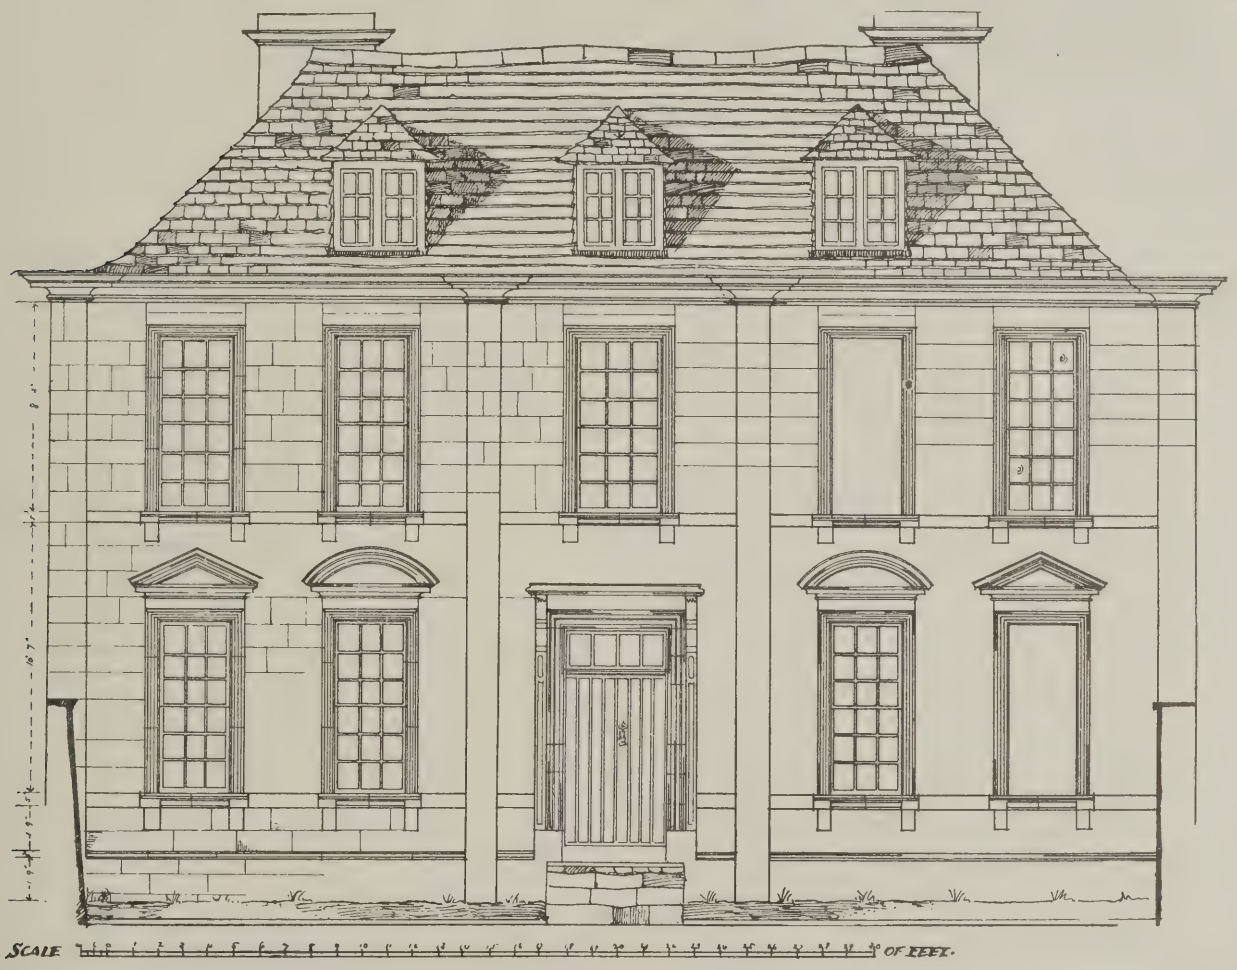
Before the Anthropological Section Mr. H. Balfour read a report on the further excavations at Arbor Low Stone Circle in Derbyshire to ascertain

The Age of Stone Circles.

He observed that the excavations begun last year had been continued during the present. About 38ft. of the fosse were excavated in digging three trenches across it. The vallum also had been cut through at one point, and was found to be largely built up of huge blocks of limestone from the fosse. Excavations were made cutting through the small dyke which lay outside the circle itself, and it had been determined that this dyke and ditch were either contemporaneous with or later than the circle. It could be taken as evidence that the circle, at any rate, was not early neolithic, but belonged either to the late neolithic or early bronze age. The other evidence in support of this lay in the absence of metal amongst the finds and the fact of a bronze-age tumulus having been constructed from material which formed part of the structure of Arbor Low. It was fair to suppose that a long interval elapsed before the circle was thus damaged for building the tumulus.

In the course of a paper on a "Prehistoric Cemetery-Cave in Palestine" Mr. R. A. Stewart Macalister said the excavation had been made was on the site of the ancient city of Gezer. Overlaid by *débris* which might tentatively be dated about 2,000 B.C., the mouth of a cave 30ft. long was found which proved to have been artificially cut out to serve the purpose of a crematorium, a chimney having been cut in the rock to provide the draught necessary for the fire.

Early Irish Design.



Mr. P. J. O'Reilly read a paper on the "Survival of Certain Pagan Sepulchral Symbols on Early Christian Monuments in Ireland." The monuments included cupped stones, stones with a cupped medial-band design, others bearing cup and concentric circle designs, others showing this design in combination with a radiating triple-line design, a cupped "fish-bone" design and combinations of cup and concentric circles and "fish-bone" designs. That these designs were wrought at a later period than their Pagan prototypes, and that the stones bearing them were not Pagan sepulchral monuments utilized as memorials of Christian dead, was shown by the existence on one at Dalkey of a symmetric combination of two cup and concentric circle groups and four single circles with an incised cupped Irish wheel-cross undoubtedly of Christian origin and contemporaneous with the remainder of the design, thus forming a valuable link between the Pagan-like patterns of the earlier members of the series and the free-standing crosses of the district, four of which bore the single-circle symbol.

Reports were read on "Excavations in the Roman Fort at Gellygaer, near Cardiff," and on "Excavations in the Roman City of Silchester."

The Strange Ruins of Rhodesia.

Mr. F. P. Mennell, Curator of the Rhodesia Museum, read an interesting paper on "The Khami Ruins near Bulawayo." He said that all over Southern Rhodesia were numerous structures testifying to a former occupation of the country by a race far more advanced in the arts than the Bantu tribes, who were shown by Arab records to have inhabitated the country for fully 2,000 years. The Khami ruins, situated twelve miles from Bulawayo, might be taken as typical. They consisted of about a dozen separate structures showing the usual mortarless walls faced with carefully-squared granite blocks about twice as large as an ordinary brick. These walls were about 3ft. thick, and as a rule rose perpendicularly without any batter to heights of 10ft. to 20ft. or more. The exterior walls roughly conformed to the shape of the ground available, or were more or less circular, but the interior ones ramified about in a most intricate manner. The principal ruin had three sets of walls at different levels. The main entrance had square ends to the walls on either side, and recent excavations had revealed the fact that a series of stone-built steps led up to it from the foot of the slope. In other cases the walls were rounded off at the entrances, and rounded buttresses supported them at times. Other devices in the way of decoration were the "chess-board" and "herring-bone" patterns, formed by varying the positions of the facing blocks and the introduction of dark-coloured dolerite blocks to contrast with the granite.

It had been stated that these structures could not have been roofed in, and in only one instance out of many hundreds was a covered entrance known. At Dhlo Dhlo

EIGHTEENTH-CENTURY HOUSE AT WESTWOOD, WILTS. MEASURED AND DRAWN BY W. HOLLAND HOBBISS.

COURTYARD OF THE "GEORGE INN," NORTON ST. PHILIP, NEAR BATH.

ruins, however, there were the remains of wooden posts let into the masonry, and these had now been found at Khami also. It was possible that they were intended, in some cases at least, as supports for a roof. That the buildings were intended primarily as forts could be inferred from their inaccessible situations, their narrow and well-commanded entrances, and the fact that the sides of some of the hills on which they were built had evidently been artificially steepened.

Discrimination was rendered difficult by the obvious fact that the natives had copied the designs of the earlier workers. This might indicate either that they were the degenerate descendants of the builders of these remarkable structures, or that their ancestors were forced to work for the latter as slaves—probably the correct explanation.

There were no inscriptions of any kind in any of the ruins, nor of iron tools such as must have been used in dressing the stone for building. The tools might well have rusted away during the thousands of years that had almost certainly elapsed since they were laid aside, but the absence of inscriptions was not so easy to explain if these structures were the work, as had been contended, of the Sabæans of Arabia.

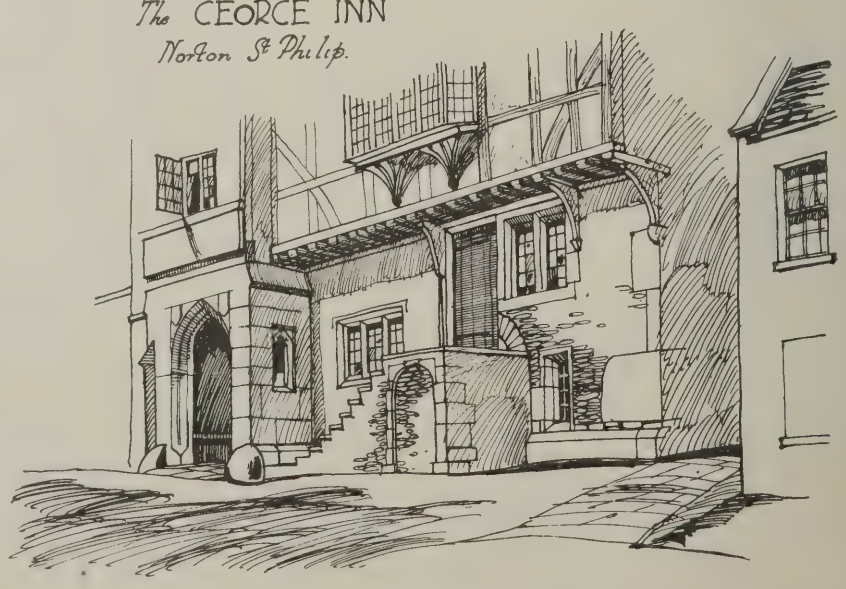
Palaiokastro.

Mr. J. L. Myres read an interesting paper on the 1902 excavations at Palaiokastro in Eastern Crete undertaken on behalf of the British School at Athens by Mr. R. C. Bosanquet and others, and said that the results obtained were so promising that he hoped to arrange for a campaign on a larger scale in 1903. After giving a general description of the physical features of the district, he said that in Mycenæan times Palaiokastro appeared to have been one of the principal centres, perhaps the capital, of Eastern Crete. Excavations there had resulted in the discovery of a Mycenæan town extending over an area of at least 500yds. by 300yds. The houses near the sea were built on the gravel cliff and were generally humble in character. The largest house examined lay inland in a group of apparently spacious upper-class houses, constructed partly in the "megalithic" style characteristic of the Mycenæan homesteads so common in the limestone districts of Crete, partly in regular ashlar masonry; the upper storeys were of brick. The author described the interior, showing views of the megaron or courtyard, 25ft. long, the roof of which was supported on four columns placed round a cemented impluvium 6ft. square. An interesting part of the house was a sunken bathroom, a reproduction in miniature of those found in the palaces at Knossos and Phaestos. The house was originally one-storeyed; later a second storey was added in brick, with two staircases leading to it, one of them about 6ft. wide. On the addition of this storey some of the lower rooms were apparently converted into magazines.

A Derby Architect's Failure.—The affairs of Frederick Charles Coulhurst, builder and architect, of Derby, came before the Official Receiver last week. Debtor said he commenced business in 1883, when he purchased a practice for £1,500. In 1886 he entered into partnership with a Mr. Booty, who brought £500 into the business. The partnership was dissolved in 1900, and since then debtor had carried on the business on his own account. The examination was adjourned for a month.

Engineering Notes

The Will of Mr. W. F. Faviell, M.I.C.E., who made the first Indian railway, his last contract being to extend the Port Elizebeth Railway, South Africa, left estate valued at £135,900 1s. 8d. gross, including nett personality £126,372 1s. 9d.



Mr. A. W. Ackermann, A.M.I.C.E., M.S.I., who has been practising as an engineer and architect in Cape Colony for twenty-six years (for the last six in partnership with Mr. W. Adamson as Messrs. Ackermann & Adamson), has just dissolved partnership and is returning to England for some time. His business address is 47, Victoria Street, Westminster, S.W.

Mr. Hamilton Owen Rendel died in his sixtieth year last Wednesday at Barlaston, Staffs. He was at the head of the engineering department of the Elswick Works, Newcastle-on-Tyne, until about two months ago, when he retired owing to ill-health. He was the youngest son of the late Mr. James Meadows Rendal, F.R.S., C.E., who constructed the great harbours of Holyhead and Portland, as well as other important Government works.

A Consulting Engineer's Affairs.—The affairs of Frederick H. Bowman, consulting engineer, of 30, Victoria Street, Westminster, came before the Court of Bankruptcy on Thursday last. Debtor attributed his failure to his connection with the Higher Antley Brick and Tile Co. The statutory accounts were not filed, but proofs amounting to £5,712 13s. were lodged, and the assets appeared to consist chiefly of shares in certain companies. The meeting was adjourned.

Masters and Men.

Labour in August.—The Board of Trade states that employment in the building trade generally is rather dull except for masons. With most branches it is not so good as a year ago, but is slightly better than in July. The percentage of unemployed union members among carpenters at the end of August was 2·8, as compared with 3·0 at the end of July and 2·6 in August, 1901. The percentage for plumbers was 6·1, as compared with 6·5 in July and 5·8 a year ago.

DRAWN BY A. DENNIS THACKER.

BRITISH ARCHAEOLOGY.

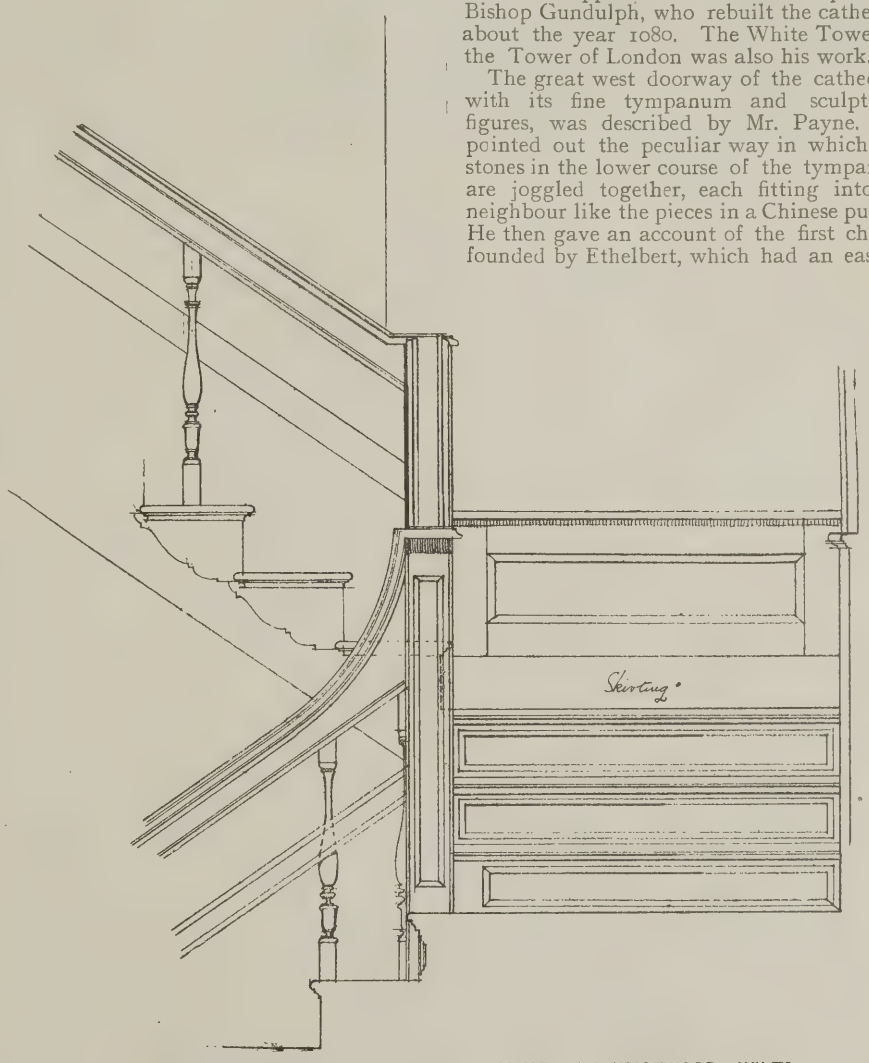
THE British Archæological Association held its fifty-ninth annual congress last week. On Monday afternoon the members met at Caxton Hall (the old Westminster town hall), when the Mayor of Westminster (Lieut.-Col. Clifford Probyn), who is president of the Association for the coming year, formally declared the congress open. In the course of his address he said that a more appropriate place than Westminster could not be found for the congress, as, according to Sir Walter Besant, Westminster was more ancient than the city of London ; for Thorney or Bramble Island—the former name of Westminster—was an important trading centre long before Londinium grew out of the marshes. As Mayor of Westminster he was bound to regard with approbation the increasing attention paid to the study of

Ancient Memorials of a National Character

rather than to the exclusive admiration of the more remote remains of the Latins and the Greeks. At one time nothing that was not "classical" was deemed worthy of the attention of the antiquary. But the Association, being so emphatically the British Archæological Association, had taught us that archæological antiquarian research, like charity, best began at home, rewarding us with richer and more informing results, involving a more poignant veneration for those who had gone before us, who built better than they knew, and inspiring a more knowledgeable pride and affection for our native land. He marked with the heartiest approval that particular object of the Association—the preservation, as far as was possible, consistently with the imperative requirements of the living, of our ancient monuments. Old houses and historic alleys must, for example, however old and picturesque, give way to improvements such as those now being conducted in the Strand, with which he had a great deal to do in his official capacity, but much could be done to preserve from wanton destruction or ignorant neglect those works of ancient times that still existed everywhere throughout this England of ours. He would be wanting in appreciation if he did not mention the work of the London County Council in this respect. He desired to see the powers of the Ancient Monuments Protection Acts conferred upon the Westminster City Council, so that the Council might be enabled to preserve such a monument as the old Roman bath in the Strand, that might perchance be any day swept away by some ruthless speculating builder after having weathered the dangers of centuries. It should certainly be his business to impress upon his council their imperative duty to collect, collate and catalogue the invaluable muniments and records, many of them almost unknown to the antiquary, of the eleven parishes that constituted their city, to which students could obtain access. The national importance of archæology was obvious, for the study of the past helped to solve the riddle of the future, and thus the historian was exalted into the seer.

The East Window of St. Margaret's Church.

The members afterwards visited St. Margaret's Church, and had its 1,000 years of history briefly described by the rector, Canon Hensley Henson. Its plain exterior belied, he said, its rich interior. Mr. J. Chalkley Gould told the remarkable story of the east window, which 400 years ago took five years to be executed in Holland, intended by King Ferdinand as a gift to Henry VII. for erection in Westminster Abbey. But the king died before it was finished, and it found its way temporarily to the Abbey of Waltham. For three centuries it underwent many vicissitudes. Having been bought by the owner of Copt Hall, Essex, for fifty guineas, it was sold by his son in 1759 to the churchwardens of St. Margaret's, Westminster, for £420. For three years it was the subject of a lawsuit as a "superstitious picture." The final judgment that the Crucifixion (the subject of the window) was not alone, and therefore not intended for worship, has been cited in all similar suits, notably in connection with the reredos of St. Paul's Cathedral.



The Castle and Cathedral of Rochester.

On Tuesday the members visited Rochester to inspect the cathedral and castle, and the celebrated Elizabethan mansion, Cobham Hall, and Cobham Church with its unique series of brasses. The castle was first visited under the guidance of Mr. G. Payne, F.S.A., who is superintending the work of the corporation (which has been in progress for some years) for the preservation of the ruins. Mr. Payne gave an interesting account of the discoveries made in the course of the restoration. The dungeon in which the queen of Robert Bruce was confined in 1314 appeared until recently to be a small chamber, but in reality it had become filled up in the course of years with earth, which was dug out to a depth of 14ft., when the original stone floor was reached. The tracing of successive repairs was exceedingly interesting, as was the account of the methods adopted to show the parts rebuilt by Henry III. Part of a Norman arch in the chapel on the upper floor has been uncovered, and just sufficient of it is shown to contrast the original Norman architecture with later work. The castle had often suffered from fire, of which there were many evidences ; parts of the walls were covered with molten lead to a depth of 2in. The whole of the existing remains had generally been attributed to Gundulph. This Mr. Payne believes to be an error. The curtain wall was no doubt erected by Gundulph, and may be distinguished by the peculiar courses, in which the stones are set diagonally, from the somewhat later Keep, which, there seems now to be no doubt, should be attributed to Archbishop Corbeuil, who was the first Constable of the castle. The party then viewed the core of the Roman wall, which was first thickened and raised by Gundulph, and afterwards by Henry III. In the castle were also seen piles of wood which formed part of the old Roman bridge across the Medway. They were discovered beneath the foundations of the old bridge during the erection of the present structure.

At the cathedral interest centred in an ancient tomb on the south side of the altar, which is supposed to be the burialplace of Bishop Gundulph, who rebuilt the cathedral about the year 1080. The White Tower in the Tower of London was also his work.

The great west doorway of the cathedral, with its fine tympanum and sculptured figures, was described by Mr. Payne. He pointed out the peculiar way in which the stones in the lower course of the tympanum are joggled together, each fitting into its neighbour like the pieces in a Chinese puzzle. He then gave an account of the first church founded by Ethelbert, which had an eastern apse, the outline of which is now recorded by carved lines on the floor of the north aisle of the present building. Though built in Roman fashion, Ethelbert's was a Saxon church. Gundulph's cathedral extended to the present pulpit, and had a nave of nine and a choir of six bays. Between 1115 and 1130 A.D. it was reconstructed by Ernulph and John, whose work, notably in the triforium, might be recognised by its ornate character. From the choir eastward the work is of a later date. The walls of the Norman church are inside the walls of the choir, which show an Early English casing.

At luncheon, which was served in the Bull Hotel—the scene of some of the most amusing incidents in "Pickwick"—a vote of

STAIRCASE IN EIGHTEENTH-CENTURY HOUSE AT WESTWOOD, WILTS.

THE MANOR-HOUSE, CHALFIELD, WILTS.

thanks to Mr. Payne for his addresses was passed.

Cobham Hall and Church.

The drive to Cobham Hall, which lies about five miles from Rochester, was by Gadshill, the residence of Charles Dickens, and Cobham Woods. A paper on the history and the architecture of the building was read by Mr. Payne, after which Lord Darnley conducted the visitors through the picture and portrait galleries, containing works by Rubens, Titiens, Vandyk, Reynolds and Gainsborough. In acknowledging a vote of thanks, Lord Darnley said he was always very pleased to show Cobham Hall to visitors.

At Cobham Church the party were received by the vicar, the Rev. A. H. Benger. The series of brasses in this church, extending across the floor of the chancel, were described as the finest and most complete in the country. The church is in the main of the fourteenth century; traces, however, of an earlier church have been discovered in some Roman tiles built into a piece of wall utilised in the existing church. Part of this old work has been uncovered in the south aisle, and is now protected by a grille, which everybody agreed was a highly creditable production for the village blacksmith, by whom it was made. The church contains good sedilia and a piscina of the Decorated period, and recent researches have brought to light an earlier double piscina, which has been inserted to the west of the sedilia. In the south wall of the chancel is a flight of stone steps, supposed to have led to a gallery for the exhibition of relics to the people. The adjoining "College," as it is called, or the ancient residences of the priests attached to the church, which since the Reformation have been used as almshouses, was also inspected with great interest.

Compton's Norman Church.

Guildford was the centre of Wednesday's proceedings. The members went by train to Godalming, and thence drove to the village of Compton to inspect its Norman church. Mr. Ralph Nevill, F.S.A., who acted as guide, said that what made the church unique from the archæological point of view were its two chapels or sanctuaries, one above the other, in the east end. Nothing authentic was known to explain this curious feature of the church. In the upper chapel—formerly approached from outside the edifice, but now reached by the internal wooden stairs—there is an early Norman piscina, and fronting it is an oak balustrade, which is said to be the oldest piece of carving in England. The altar rails are also a fine example of Jacobean carving. Mr. Nevill said he was glad that in the rage for things Gothic they had not been replaced by rails of brass from Birmingham.

Loseley Place and Guildford.

The manor-house, Loseley Place, described as the oldest Elizabethan house in the kingdom, was next inspected. The party were received by the owner, Mr. W. More-Molyneux—the house was built by his ancestor, Sir William More, about 1562—who described its pictures and other art treasures. The muniment room contains a very large collection of ancient manuscrips of the Tudor and Stuart periods. In the hall, which has a minstrels' gallery, is some exceedingly fine woodwork and a panelled screen, curious rather than artistically beautiful, in which, by means of carving and inlaying, the idea of perspective is conveyed to the spectator, who seems to be looking at a series of arcades rising above a pavement of black and white marble.

The party then proceeded to Guildford to inspect the many places of archæological interest in that picturesque town. They were shown over the Church of the Blessed Virgin Mary by Canon Grant. The general character of the building is Norman and Early English. It contains two chapels—St. John's to the north of the high altar, and St. Mary's to the south.

At Guildford Castle a paper on the history of the square Norman keep—which is now surrounded by public gardens, laid out by the corporation of Guildford—was read by Mr. H. E. Malden. He said that the first mention of the Keep was in 1202, when the sum of 4s. was paid out of King John's Exchequer for its repair as a prison, the hall and other buildings, of which little trace now remains, being used for residential purposes. The Keep continued to be used solely as a county prison until the reign of James I., when the castle was sold by the Crown to a family named Carter. The property ultimately passed to Lord Grantley, from whom it was purchased by the corporation of Guildford in 1885 and laid out as a place of recreation, which was dedicated to the public use for ever on Jubilee Day, 1887.

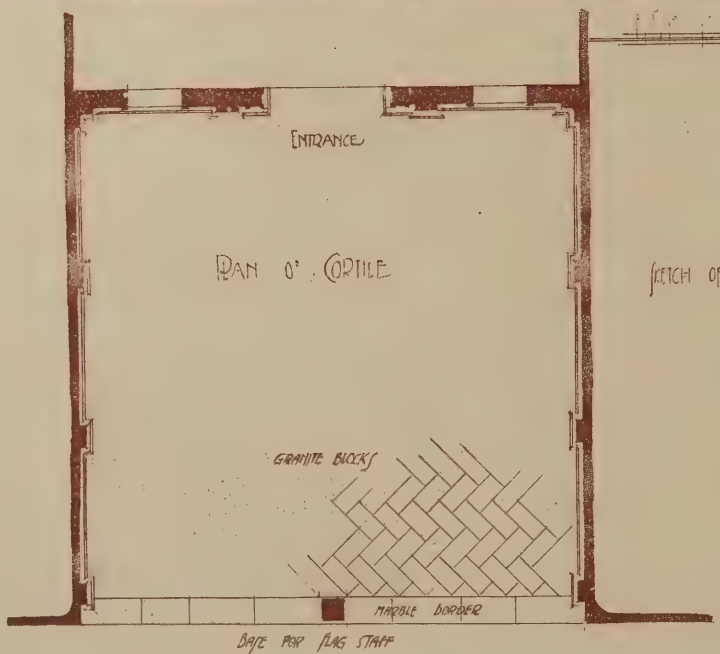
The Keep is a good example of the way in which the Normans copied the Roman fashion of building, and also made use of Roman material in constructing their massive fortresses. At Guildford, Roman tiles are built into the walls and not improbably some of the squared stones, as at other places, were hewn by Roman masons. In the arrangement of the different courses the Roman plan is often followed, flint being succeeded by tiles or tile-shaped stones, with occasional courses of herring-bone work.

At the Guildhall, which dates from 1683, the corporation plate was exhibited by the mayor and described by Mr. Nevill.

Abbot's Hospital, built by Archbishop Abbot in 1619, was next visited. The revenue from the lands with which the archbishop endowed the building is still devoted to the support of "twelve poor brothers" and "eight poor sisters," who reside in different wings of the hospital. The chapel contains an excellent portrait of Archbishop Abbot.

Colchester Castle.

On Thursday the party visited Colchester. The Keep, the only remaining portion of the castle, stands on an elevation of an entirely different character from that at Guildford. To obtain the necessary height, together with solidity, a mass of sand was heaped up on the hill sloping down to the Colne, and on this a series of concrete arches, each with a span of about 15ft., was constructed. On the foundation thus obtained the superstructure was erected. The vaults may be visited, and one of them still contains a considerable portion of the sand on which the arches were turned. In plan the Keep is quadrangular, with square turrets at the angles. At one time it was ascribed to the Romans. According to Dr. Laver, it stands in what was the forum of the Colonia Camelodunum, the walls of which have been carefully traced out by him. In the excavations which were made under his superintendence a row of shops was discovered by the forum wall, and traces of a piazza or covered way.



Norman Pillars and Wall-work.

After lunch the time was devoted to ecclesiastical remains and the Roman wall. In one respect the church of the Augustinian Priory of St. Botolph resembles the castle—

the materials are entirely Roman. The huge Norman pillars are built up of small stones, flints and tiles, and a tile-course serves for the usual capital. The question is often asked whether such pillars were plastered. They undoubtedly were, for in several places the stucco still remains. There is a good western doorway, and above are two rows of intersecting semicircular arches in red Roman tiles, which, from the nature of the material, form lancet arches where they intersect. The floor has been filled up, but excavations to the depth of about 5ft. have revealed portions of the original flooring. There are no remains of the religious house to which this church belonged, nor of the Benedictine Foundation of St. John, not far off, of which only the gate is standing.

The Roman walls are a characteristic feature of Colchester, and roughly form a parallelogram—of course, broken in places—the sides of which measure somewhat less than two miles. The material is stone from the neighbourhood with regular bands of tiles. The usual thickness is about 8ft., but considerably more at the gates and posterns. The most important parts are a guard-room, of which very few remain, and a turned arch of Roman brick in one of the ruined bastions. Time has dealt heavily with these walls in some parts, but the means adopted to preserve them are the best possible. They have been strengthened wherever necessary, but in no case does the new work simulate the old, and had not repairs been effected they must in places have fallen into ruins.

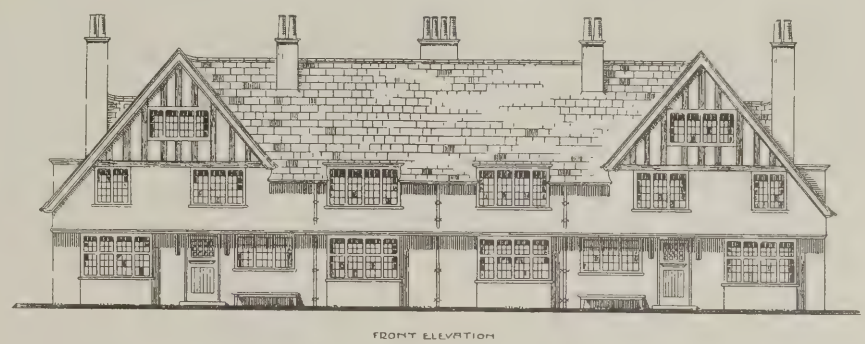
Staple Inn.

On Friday the members returned to London and paid visits to Westminster Abbey and Staple Inn. In a paper on the latter Mr. T. Cato Worsfold mentioned that in 1884 "the ancients" sold the inn for £80,000, and it was contemplated to pull it down and erect modern offices and residences upon the site But this interesting survival of mediæval London was preserved by the Board of Works purchasing the ground on the south side of the inn for the extension of the Patent Office, and the remaining portion of the inn coming into the possession of the Prudential Assurance Co. for £68,000.

The concluding meeting of the congress was held in the evening at the Westminster Palace Hotel, when Dr. Brushfield read a paper entitled "Britain's Burse," descriptive of the new exchange in the Strand opened in 1609 to compete with the old or Royal Exchange opened by Queen Elizabeth in 1571. The Burse was closed in 1737, and was soon after demolished.

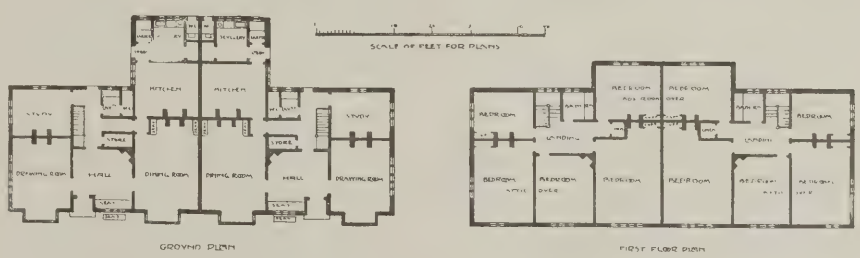
In all probability Sheffield will be the meeting-place for next year's Congress.

A New Isolation Hospital for Infectious Diseases has just been opened at Tanfield. It is erected upon a site of three acres, and the cost, exclusive of the site, will be about £8,000. The building has been designed by Mr. George T. Wilson, of Blackhill, and the principal contractor was Mr. Thomas Mordue, of Dipton. The administrative block in the centre is connected to the male and female wards on either side by long corridors. There are sixteen beds in each wing, making provision for thirty-two patients. The whole of the building is of stone, with dressed facings, &c.; the floors are laid in marble terrazzo, and the walls composed of Parian plaster. Every angle in the building is rounded off. In front of the main buildings are the washhouses, patent drying closets, ironing-room, ambulance carriage-house, mortuary and disinfecting chamber. The drainage is disposed of by three large filter beds, constructed in a wood some 300yds. distant from the main buildings.



CURIOUS.

IN our issue for September 3rd we published, as a centre plate, a design for a pair of small country houses by Mr. F. E. Ravenscroft, of Reading—a design hung in this year's Royal Academy exhibition. Our attention has since been called by a Blackburn correspondent to the design for two country cottages published in our contemporary the "Building News" for December 4th, 1896, this design having been awarded the first prize in one of the competitions which our contemporary holds. We republish the two designs on this page, the upper one being Mr. Ravenscroft's. There is such a striking resemblance between them that we wrote to Mr. Ravenscroft asking whether he was the author of the design published in our contemporary (no name having been given on it), in reply to which he says:—"I know nothing about any 'Building News' designs, as I never, or hardly ever, see the 'Building News,' and have never been a competitor in any of its competitions."



There is doubtless nothing new under the sun, but this is a most astonishing case of cerebral parallelism.

CREWE TOWN HALL COMPETITION.

FORTY-FOUR sets of designs were sent in for the proposed new municipal buildings at Crewe. The Corporation intend to utilise the site of the existing municipal offices, with the addition of the adjoining hairdresser's shop, the Market Tavern public-house, the fire station, and the Corn Exchange, the estimated cost of the scheme being £14,000. Messrs. Woodhouse & Willowby, the well-known Manchester firm of architects, were appointed as advisers to the Corporation in the selection of the first and second designs, and they have awarded the first premium of £50 to Mr. Henry T. Hare, F.R.I.B.A., of London. With regard to the second award of £25, they reported that the designs of three competitors were of equal merit, and suggested that the Committee should increase the amount to £30 and give each of the three £10. This the Committee have decided to do, and the second prize will therefore be divided between Messrs. Banister Fletcher & Sons, London; Mr. Albert E. Dixon, A.R.I.B.A., Leeds; and Messrs. Rodway & Denning of Bristol. The height

: FRONT ELEVATION :

: FIRST FLOOR PLAN :

C. J. F. PALMER, ARCHITECT.

of Mr. Hare's building to the ridge of the roof will be 56ft., or several feet higher than the premises of the Mechanics' Institution on the opposite side of Earle Street. The basement is to be wholly occupied by commodious store-rooms, and the rooms on the ground floor will be allocated as follows:—Borough accountant's department (consisting of a private office, general office and strong-room); rate collectors' department (a private office, general office, strong-room and cash office); sanitary inspector's department (general office, private office, stores and night foreman's office); and weights and measures department (general and private offices). On the first floor the principal room will be the council-chamber, which will be situated at the back of the building so as to obviate any noise from traffic in the streets. The mayor's parlour and reception-rooms will adjoin the council-chamber, and provision is also made for two committee rooms, an ante-room, cloakrooms, &c. The town clerk's department will be on the same floor, and will include a private office, an assistant's office, general office, waiting-room, strong-room and stores. In the front portion of the second floor there will be the medical officer's department (private office, clerk's office, waiting-room, stores and chemical laboratory), and the school attendance officer's department (private office and waiting-room, together with a room for committee meetings). The borough surveyor's department will also occupy the second floor, and the rooms will include a private office, clerk's office, building inspector's office, drawing office, plan-room, waiting-room, &c. The new buildings will cover an area of 880 sq. yds., with a frontage to Earle Street of nearly 92ft. and an average depth of 86ft.

Law Cases.

Party Walls under the L.B.A.—At Greenwich Police Court last week Mr. Baggallay gave judgment in a case which was argued recently by Mr. Germaine for the owner and Mr. Palmer Andrews for the London County Council. The summons was against Mr. Badger, district surveyor, at the instance of Mr. G. F. Havell, builder, High Road, Lee, who applied that the order of the district surveyor with reference to the connection of buildings Nos. 1 to 4, Obelisk Buildings, Lewisham, should be reversed. Mr. Baggallay, in his judgment, said the district surveyor had required the builder to carry out section 74, sub-section 2, which provided for special protection from fire in the case of any building used in part for trade and in part as a dwelling-house. These buildings were erected before 1894, and no objection could have been taken to them under any law then in force. Neither building was, however, constructed in accordance with section 74, sub-section 2. The builder proposed to connect the two buildings by making an opening in the party wall which separated them, and in these circumstances contended that No. 5 should be treated as an addition to Nos. 1 to 4, and that, provided No. 5 be so altered as to comply with the section of the Act of 1894, he could not be compelled to carry out the requirements of that sub-section in respect of the buildings Nos. 1 to 4, and he relied on sections 209 and 210. If the intended operation amounted only to an addition or alteration to the existing buildings, no doubt the builder's first contention would be sound, but he (Mr. Baggallay) was of opinion that the real effect would be to unite the two buildings within the meaning of the sub-section referred to, and that in that case section 210 did not exempt him from the consequences. The objection of the district surveyor was, therefore, good, and he ordered that it be affirmed.

Bricks and Mortar.

Aphorism for the Week.

He that seeks popularity in art shuts the door on his own talents.—Mrs. Jameson.

Our Plates. "Ridgemount," Enfield, Middlesex, has recently been erected and commands extensive views towards the west. It is built of Bracknell red bricks and roofed with tiles somewhat purple in colour. The turret is covered with copper. The lozenge patterns are formed with Luton bricks and add some interest to the house. The feature of the interior is a hall extending from front to back, arranged so that the portion next the verandah can be curtained off with a separate fireplace. The house is warmed by the low-pressure system worked from the furnace in the conservatory. The builders were Messrs. Palmer, of Enfield Town.—The small green and white house at Enfield looks well in its setting of oak. The hall is panelled, and some interesting glass is used in the windows. Messrs. Allen Fairhead & Son, of Enfield Town, were the builders The architect of both these houses is Mr. Alfred H. Hart, A.R.I.B.A., of 1, Verulam Buildings, Gray's Inn.—The cortile, S. Giovanni Evangelista Venice, one of the earlier examples of the breaking away from the severe classic forms and a beautifully-proportioned structure of various coloured marbles, forms the entrance to the Scuola di S. Giovanni Evangelista, originally a building of the fourteenth century, but now modernised in the interior. Fortunately the cortile is untouched, as is also one side of the handsome old vestibule in the style of the Lombardi (1481) The drawing is by Mr. J. Forbes Smith, A.R.I.B.A.

The American Building Trust. "It is rumoured that an American Building Trust is to be formed, with a capital of some sixty-six million dollars, to take in hand the reconstruction of London."—*Daily Paper.* Inspired by this announcement "Punch" gives us these three verses:—

Say, are you sure that your Combine
(Or is it *Combine*?) will be grounded
In all the classes of design
With which we love to be surrounded?
Can you, for instance, emulate
Our Ludgate Bridge's gorgeous gilding,
Erect the Fleet Street Griffin's mate,
Or beat the Admiralty building?

Can you prepare us plans to rank
With British Art's supreme creations?
Could you have built the Birkbeck Bank,
Or Paddington and King's Cross Stations?
Will you, when decorating walls
(Like some with whom we're well acquainted),
Declare the frescoes in St. Paul's
Are not so bad as they are painted?

If so, we greet you—oh, but stay,
It's only right for us to mention
That others in the building way
Are giving us their best attention;
And so we fear you cannot come,
Unless the Trust that you announce 'll
Put by a fairly handsome sum
To pension off the County Council.

Sydney's Parliamentary Buildings. In January, 1888, Lord Carrington, then Governor of New South Wales, laid the foundation-stone of what was intended to be a gorgeous pile of Parliamentary buildings in Sydney. During the fifteen years that have since elapsed it has not been introduced to a single companion. Once more the propriety of providing Sydney with a decent Parliament House is being urged. The collection of ramshackle wooden sheds that have served for sixty years are reported to be in imminent danger of collapse through the ravages of white ants. How they have contrived to escape destruction by fire is a puzzle. They were originally erected in the early years of the last century by a trio of enterprising Sydney citizens, who undertook to build a hospital if permitted by the ruling military authorities of the period to import 45,000 gallons of rum.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Heating a Public Hall.

Cardiff.—P. B. writes: "What would be the most economical means of heating a hall as shown by the accompanying plan (not reproduced)? Would gas stoves be likely to prove unsatisfactory in any way?"

The most economical way of heating the hall would be by means of hot air or steam. The heating of such a hall must be considered in conjunction with its ventilation. Both are influenced by the position (sheltered or otherwise) of the building; of the material of which it is built; and of the purpose for which it is used. Presumably the hall is used for religious services or lectures, that is, for one hour and a half or two hours at a time, and then completely emptied. If there is a cellar under the whole of the hall, a hot-air furnace would be most economical; if there is no such cellar, a steam apparatus would be better. The hot-air ducts or steam radiators should be placed under the windows as well as in the aisles. To heat by means of gas would not be economical, though it would require less attention. To burn the gas in open stoves in the hall would almost certainly cause a disagreeable smell. To burn gas in enclosed stoves after the manner of a hot-air furnace would be expensive.

Situations in Architects' Offices.

London, N.W.—W. L. C. writes: "Should I experience any great difficulty in obtaining a berth in an architect's office? Kindly also advise me as to any suitable Government vacancies. I am at present in the drawing office of a large engineering firm, where I have acquired considerable experience in steam and hot-water heating, laundry schemes, &c. I also have a silver medal for advanced building construction, and four bronze medals for other building subjects, besides certificates"

Particulars of Government appointments are given on p. 148 of our issue for April 23rd last, and on p. 451 of our issue for February 12th last. As you have a knowledge of heating and laundry machinery we should think you would do best by endeavouring to become a specialist in these branches, as there is plenty of scope for a consulting engineer, work of this nature at present being mostly confined to trade firms. You should be able, with your qualifications, to obtain a situation in an architect's office by replying to "Situations Vacant" advertisements.

Books on Sewage Analysis and Civil Engineering.

Sunderland.—Enquirer writes: "(1) What book will enable me to make simple analyses of water and liquids from sewage works, without a knowledge of chemistry? (2) Which is the best book on civil engineering dealing especially with viaducts, bridges and railways?"

(1) You will need at least an elementary knowledge of chemistry to undertake any kind of analysis. "Sewage Works Analysis," by Gilbert J. Fowler (P. S. King & Son, 2 and 4, Great Smith Street, Victoria Street, S.W., price 6s. nett) should serve your purpose. (2) We advise you to get these two books:—"Civil Engineering as applied in Construction," by L. F. Vernon Harcourt (Longmans, Green & Co., 39, Paternoster Row, E.C.; price 14s. nett)"; and Rankine's "Manual of Civil Engineering" (Charles Griffin & Co., Ltd., Exeter St., W.C., price 16s.).

MEANS OF ESCAPE IN CASE OF FIRE.*

By H. D. SEARLES WOOD, F.R.I.B.A.

THE history of the first enactment in this matter is rather curious. A retired military officer invented a balcony with a collapsible bottom which was worked by means of a lever, and when let down formed a staircase. The idea was taken up, and a Bill, called the Life and Property Protection Act, 1891, to make the provision of such escape compulsory, was introduced into Parliament and passed its second reading on May 29th.

This Bill provided :—

1. It shall be the duty of the owner or owners in fee or for life of every building constructed and used or intended to be used as a hotel, factory, manufactory, workshop, store, warehouse, theatre, tenement house, seminary, college, school, academy, hospital, asylum, hall, place of public resort or amusement, and of the trustees of association, society, college, academy, school, hospital, corporation or asylum, the guardians of the poor governing any workhouse, school, hospital, asylum, factory or workshop, and the owner or owners of all buildings 40ft. high or upwards in which four or more families reside, and the owner or owners of all places of business 40ft. high or upwards where the employees to the number of twelve or more sleep on the premises, and the owner or owners of all other buildings for any of the purposes herein above mentioned, to provide, maintain, and cause to be erected and fixed to the outside of said buildings iron fire escapes, being when in use of the form of stairs at an angle or incline of not less than 35 degs., and of such simple construction as can be used by a youth or old person of either sex, and as may be approved by the county council in their respective counties.

2. In all hotels, factories, manufactories, workshops, schools, seminaries, colleges, hospitals, asylums, halls, theatres or other places of public resort or entertainment, workhouses, or other places mentioned in this Act, the hallways and stairways shall be properly lighted when occupied at night, and there shall be kept posted in a conspicuous place in every sleeping room a notice printed in large bold type descriptive of such means of escape; and the officer or officers appointed by the county council for enforcing and carrying out the provisions of this Act shall have the right to designate the location and decide the number of escapes for each building, and shall grant certificates of approval to any person, firm, corporation, trustee, board of guardians and school board complying with the requirements of this Act, which certificate shall relieve the party or parties from the liabilities of fines or damages imposed by this Act.

3. Every person, firm, corporation, trustee, board of guardians and school board neglecting or refusing to comply with the requirements of the first section of this Act upon receiving thirty days' notice in writing having a copy of the first section of this Act endorsed thereon shall be liable to a fine of *five pounds* for each day after the expiration of the said thirty days until they have conformed with the requirements of the first and second sections of this Act, and such fine shall be collected as fines on summary conviction before a magistrate are now by law collected; and the county council may erect the necessary appliances on such building or buildings, and the cost and expenses of and incidental to the erection of such appliances shall be charged and held as a first lien against such property.

4. In case of fire occurring in any building not provided with such appliances in accordance with the requirements of the first and second sections of this Act, the person or persons, trustee or trustees, corporation, board of guardians and school board who or which neglect to provide such building or buildings with such appliances as aforesaid, shall be liable in an action for damages in case of death or personal injury being caused in consequence of such fire breaking out in said building or buildings, and such action may be maintained by any person or persons now authorised by law to sue as in other cases for injuries caused by neglect of duty.

5. The county councils in England, Scotland and Wales shall appoint and pay such number of inspectors for seeing that the provisions of this Act are carried out in their respective counties as they may deem necessary, and until the creation of such county councils in Ireland the inspection of buildings in that part of the kingdom shall be performed by the district and county surveyors.

6. Any person refusing to admit such inspector to enter their building or buildings for the purposes of this Act shall be guilty of an offence against this Act, and may be summoned before a magistrate, and may on conviction be fined any sum not less than *forty shillings* or more than *five pounds*, or may be imprisoned with or without hard labour for any term not less than *three days* or more than *one month*.

7. For any offence against the provisions of this Act not specially provided the party so offending may be summoned before a magistrate, and may on conviction be fined any sum not less than *forty shillings* or more than *five pounds*, or may be imprisoned with or without hard labour for any term not less than *three days* or more than *one month*.

8. Proceedings for enforcing penalties under the provisions of this Act shall be taken and conducted by the solicitor acting for the council of the county in which the offence is committed, and the costs of such proceedings shall be borne by such council, but the magistrate before whom offenders against this Act are summoned may on conviction direct them to pay such reasonable costs as he may think proper.

9. All Acts or parts of Acts inconsistent with this Act are hereby repealed.

10. This Act may be cited as Life and Property Protection Act, 1891.

While this Bill was before the House a fatal fire occurred in Cloth Fair, Clerkenwell, which drew the attention of the public to the serious condition as to safety of the employees in many of the factories and workshops, so that section 7 of the Factory Act, 1891, was passed and the Life and Property Protection Act was dropped.

The section is as follows :—

7. (1) Every factory of which the construction is commenced after the first day January one thousand eight hundred and ninety-two, and in which more than forty persons are employed, shall be furnished with a certificate from the sanitary authority of the district in which the factory is situate that the factory is provided on the storeys above the ground floor with such means of escape in case of fire for the persons employed therein as can reasonably be required under the circumstances of each case, and a factory not so furnished shall be deemed not to be kept in conformity with the Principal Act, and it shall be the duty of the sanitary authority to examine every such factory, and on being satisfied that the factory is so provided to give such a certificate as aforesaid.

(2) With respect to all factories to which the foregoing provisions of this section do not apply, and in which more than forty persons are employed, it shall be the duty of the sanitary authority of every district, as soon as may be after the passing of this Act, and afterwards from time to time, to ascertain whether all such factories within their district are provided with such means of escape as aforesaid, and, in the case of any factory which is not so provided, to serve on the person being within the meaning of the Public Health Act, 1875, the owner of the factory a notice in writing specifying the measures necessary for providing such means of escape as aforesaid, and requiring him to carry out the same before a specified date, and thereupon such owner shall, notwithstanding any agreement with the occupier, have power to take such steps as are necessary for complying with the requirements, and unless such requirements are so complied with such owner shall be liable to a fine not exceeding one pound for every day that such non-compliance continues. In case of a difference of opinion between the owner of the factory and the sanitary authority, the difference shall, on the application of either party, be referred to arbitration, and thereupon the provisions of the First Schedule to this Act shall have effect, except that the parties to the arbitration shall be the sanitary authority on the one hand and the owner on the other, and the award on the arbitration shall be binding on the parties thereto. If the owner alleges that the occupier of the factory ought to bear or contribute to the expenses of complying with the requirement, he may apply to the county court having jurisdiction where the factory is situate, and thereupon the county court, after hearing the occupier, may make such order as appears to the court just and equitable under all the circumstances of the case.

(3) All expenses incurred by a sanitary authority in the execution of this section shall be defrayed—

(*a*) In the case of an authority of an urban district, as part of their expenses of the general execution of the Public Health Act, 1875; and

(*b*) In the case of an authority of a rural district, as special expenses incurred in the execution of the Public Health Act, 1875, and such expenses shall be charged to the contributory place in which the factory is situate.

(4) In the application of this section to the administrative county of London, the London County Council shall take the place of the sanitary authority, and their expenses in the execution of this section shall be defrayed as part of their expenses in the management of the Metropolitan Building Act, 1855, and the Acts amending the same.

So far-reaching an enactment has rarely ever passed with so little notice being taken. When the Bill had been passed I called at the London County Council office to ascertain their views of what means of escape might reasonably be required, and I was informed that they did not know they were the authority to certify under the Act, and it was not until some time after the passing of the Act that any steps were taken by the London County Council, and it was not until they had obtained considerable experience in what could be done in rendering buildings reasonably safe that they issued their regulations, which are dated June 13th, 1899. Under these regulations a very large sum of money has been laid out in making buildings comply with the requirements—during the last ten years over 1,800 cases have been dealt with. In the meantime the Act remained a dead letter in most places outside the Metropolitan district.

The Factory Act of 1895 made no alteration in regard to section 7, but under section 10 gave the court of summary jurisdiction power to make an order requiring the provision of movable fire escapes, and in every factory where the room contained more than ten persons required the door to open outwards. In the Act of 1901 the power conferred by section 10 of the 1895 Act on courts of summary jurisdiction to order the provisions of movable fire escapes is not re-enacted.

Since the passing of the Factory Act of 1901 the London County Council have issued a revised edition of their Regulations :—

Provisions of Means of Escape in case of Fire.

By the provisions of section 14, 103 (1) (*d*) and 153 (1) of the Factory and Workshop Act, 1901, the duty is imposed upon the London County Council of seeing that each factory, workshop or laundry situated within the administrative county of London in which more than forty persons are employed is provided with such means of escape in case of fire for the persons employed therein as can reasonably be required in the circumstances of each case.

The Council on July 22nd, 1902, approved the following statement with reference to the requirements in respect of the means of escape in case of fire to be provided in accordance with the provisions of the above Act, with a view to assisting factory owners and others in making application for the Council's certificate, or in submitting proposals to comply with the Council's requirements in respect thereof :—*This statement must not, however, be taken as binding upon the Council, but only as a general guide or indication, since each case is, after full consideration of the varying circumstances, dealt with upon its merits: and nothing herein contained must be taken as in any way interfering with or derogating from the powers of the Home Office, the Council, the district surveyors or of any other authority whatsoever under the Factory Act, the London Building Acts or any other Act, or under any by-laws that may be made under section 15, section 153, sub-section (3) of the Factory and Workshop Act, 1901, or under any by-laws or regulations relating to the construction of buildings or otherwise, or as constituting any consent, sanction, allowance or permission under any such Act, by-law or regulation, but all such Acts, by-laws and regulations must be fully observed and complied with notwithstanding anything herein contained.*

Applications.

(1) Applications for the Council's certificate in respect of means of escape from new buildings, and applications with proposals to meet the Council's requirements in respect of means of escape from old buildings, should state—

(*a*) The number of persons employed or to be employed on the premises, specifying the number of males and females employed or to be employed on each floor.

(*b*) The trade carried on, or to be carried on, on each floor, with particulars of machinery, power, &c.

(*c*) In the case of existing buildings used as factories, whether the premises were erected before January, 1892, and in the case of workshops and laundries, whether erected before January, 1896.

(*d*) The name and address of the owner.

(*e*) Particulars of the occupation of the building if existing, and if any part is used otherwise than as a factory or workshop or laundry particulars of the tenancy of such part should be furnished.

(2) Applications should be accompanied by complete plans and sections drawn on the unglazed side of tracing linen to $\frac{1}{8}$in. or $\frac{1}{4}$in. scale ($\frac{1}{8}$in. scale preferred) and by a block plan to a small scale showing the premises and the surrounding buildings and thoroughfares, such block plan to have the north point indicated.

Number of Staircases.

(3) The number of staircases required, *inter alia*, depends upon the following circumstances :—

(*a*) The area of the building.

(*b*) The number of persons employed or which could be employed.

* A paper read before the Congress of the Sanitary Institute held at Manchester from September 9th to 13th, 1902, and published in the Journal of the Institute.

(*c*) The disposal of the workpeople.
(*d*) The alternative means of escape which may be available.

(4) It may, however, be laid down as a general principle (subject to the exceptions hereinafter mentioned) that distinct and separate alternate means of escape, exclusive of windows, loop-hole doors, &c., are required from each floor by one of the following means :—
(*a*) A second staircase in the same block.
(*b*) A proper staircase in another block, to which access is available on all the floors by proper openings in the party or division walls or by external communication.
(*c*) Open iron bridges where the blocks are not adjoining each other.

(5) The means of escape from each of the floor-levels should be placed as far apart as possible.

(6) In all cases where practicable some means of escape from the roof of the building to the roof of adjoining premises should be provided.

(7) In small and inextensive premises where not more than thirty persons are employed above the ground floor, and in some cases where it is possible to provide a staircase in a central position, one properly enclosed staircase constructed of incombustible materials may be accepted; but in all cases where only one staircase is provided some means of escape from the roof to the roof of adjoining premises *must* be provided.

Internal Staircases.

(8) Staircases should be placed next to an outer wall and must be so arranged as to deliver by means of a doorway (not less than 4ft. 6in. wide in the clear when the doors are open) direct into the outer air at the ground level into a public way or thoroughfare or some large open space. Staircases must also be so arranged that persons enter them from any floor level in the same direction as persons descending the staircases.

(9) Staircases must be properly lighted and ventilated by windows.

(10) Staircases, including landings and passages from one flight to another, must be enclosed with newel and enclosing walls not less than 9in. thick, carried up above the roof and ceiled with iron and concrete.

(11) Staircases must be constructed of incombustible materials, with solid square or spandrel steps, arranged in straight flights, without winders; each flight must consist of not more than fifteen steps, which must be supported at both ends on brickwork, and landings must be provided at the top and bottom of each flight and between the flights. The steps and landings must be of the same width as the staircase (see paragraph 14) and not less than 6in. thick. In the case of spandrel steps, however, the thickness at the smallest part may be as set out in paragraph 16.

(12) The treads of the staircases must be not less than 10in. wide clear of nosings, and the risers not more than 7½in. high.

(13) Staircases must be provided with handrails fixed upon both sides thereof and continued round the landings and chased into the ends of the newel walls.

(14) The width of the staircases is to be regulated as follows :—
(*a*) Where the premises are adapted for the employment of less than 200 persons on the floors above the ground floor the staircases must be not less than 3ft. 6in. wide.
(*b*) Where the premises are adapted for more than 200 persons on the floors above the ground floor, or where more than 100 persons are employed on any one floor above the ground floor, the staircases must be not less than 4ft. 6in. wide.

(15) Staircases must in all cases be connected with all floors and the roof by means of doorways of the same width in the clear, when the doors are open, as the staircases.

(16) Spandrel steps where used must be of the following thickness :—
(*a*) For 3ft. 6in. staircases, not less than 3in. thick in the smallest part.
(*b*) For 4ft. 6in. staircases, not less than 4½in. thick in the smallest part.

(17) All doorways to staircases must be fitted with doors of fire-resisting materials (solid teak or oak, 2in. thick, or other approved material) in two folds, hung so as to open in the direction of exit or to swing both ways clear of steps, landings, passageways and footways; such doors must be fitted with springs, weights or other approved appliances to close them after use, and, if required to be fastened during the time the workpeople are upon the premises, be fitted during such time with automatic bolts only, so that the doors open by pressure from the inside.

(18) In the case of old buildings * (in respect of which the Council is not required to issue a certificate) where there is a distinct and separate alternative means of escape provided to the satisfaction of the Council from each of the upper floors, the enclosed staircase may be constructed of teak or oak not less than 2in. thick, including the treads, strings, carriages, bearers, landings, joists and floors, the risers to be not less than 1in. thick, but no fir or pine must be used; and the enclosure to the staircase may be a solid partition of incombustible material at least 3in. thick; but such staircase must, in all other respects, be formed and arranged as required for a staircase for a new building as regards width, going, treads, risers, doors, handrails, &c. (see paragraphs 8-17).

External Staircases.

(19) In cases in which external iron staircases are accepted by the Council as means of escape, they must be constructed with dead bearings and without cantilever work.

(20) They must comply with the requirements of paragraphs 8-17 as regards width, going, width of tread, height of risers, doors, handrails, &c.

(21) They must deliver into the outer air at the ground level into a public way or thoroughfare or some large open space.

(22) Where an iron staircase is in general use the treads must be of approved non-slippery material as distinguished from perforated iron or chequered iron plates.

(23) All windows and similar openings by or near any such staircases must be protected with kiln wire, or glazed with a combination of glass and wire or other approved fire-resisting glazing.

General.

(24) Proper guard rails must be provided to the routes of escape on roof, &c., where necessary to the satisfaction of the Council.

(25) Clear gangways at least 3ft. 6in. wide must be kept up to and between all staircases, bridges and exits on all floors.

(26) All doorways and all passageways must, where of a less width than 3ft. 6in., be increased to that width.

(27) All doors usable as means of exit must be made so as to open in the direction of exit or to swing both ways clear of steps, landings, passageways, &c.

(28) All such doors must, if required to be fastened during the time the workpeople are upon the premises, be fitted during such time with automatic bolts only.

(29) Lifts should be enclosed all up with brickwork 9in. thick or with incombustible material of approved quality and thickness, and fitted with iron or other fire-resisting doors, unless, with the approval of the Council, such lifts be enclosed with fire-resisting material to a height of 4ft. above each floor-level, and above this with stout wire-mesh guard.

(30) Lifts must be kept at some distance from staircases, and must in no case be connected directly therewith by means of openings or otherwise.

(31) All windows on the floors above the ground floor facing the public way, street, thoroughfare or open space must be made to open easily at sill-level to a sufficient height and width to allow a full-grown person to pass through in case of need.

Under section 15 of the Factory Act of 1901 a council may make by-laws providing for means of escape in case of fire in any factory or workshop irrespective of the number of persons employed. The provisions of the Public Health Act with regard to the making of by-laws are to apply to the making of these by-laws, and they will accordingly require to be confirmed by the Local Government Board before they can come into operation. Up to the present the Local Government Board have received no by-laws on this subject for approval. As the Act requires that the certificate given by the council must specify in detail the means of escape provided, it would seem desirable as a guide to the officials of the councils that by-laws should be made so as to make the certificates uniform in application.

To meet a difficulty which arose under the previous Acts in cases where a building was divided up into a number of separate factories or workshops each with a separate occupier (so that though more than forty persons were employed in the building each of the separate factories or workshops might be exempt from the provisions of the Act as to fire), it is provided in the Act that for the purposes of these provisions the whole of a tenement, factory or workshop is in future to be counted as a single factory or workshop, and the owner is to be substituted for the occupier. There is still great difficulty in arranging satisfactory means of escape where a portion of the premises is occupied in such a manner as not to come under the Factory Act. The owner is unable to carry out the improvements without committing a trespass on the premises which are outside the Act.

New York Regulations.

The fire-escape regulations in New York are as follows :—

Every dwelling-house occupied by or built to be occupied by three or more families;

And every building already erected or that may hereafter be erected more than three storeys in height occupied and used as a hotel or lodging-house, and every boarding-house having more than fifteen sleeping rooms above the basement storey;

And every factory, mill, manufactory or workshop, hospital, asylum or institution for the care or treatment of invalids;

And every building three storeys and over in height used or occupied as a store or workroom;

And every building in whole or in part occupied or used as a school or place of instruction or assembly;

And every office building five storeys or more in height:

Shall be provided with such good and sufficient fire escapes, stairways or other means of egress in case of fire as shall be directed by the Department of Buildings;

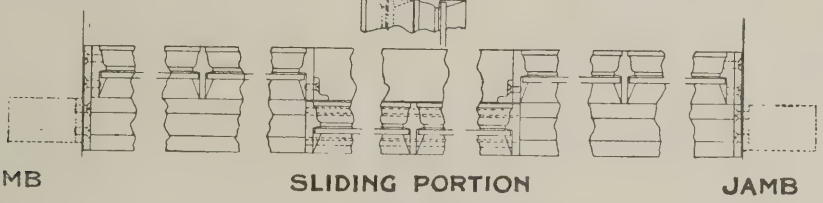
And said Department shall have full and exclusive power and authority within said city to direct fire escapes and other means of egress to be provided upon and within said building or any of them.

The owner or owners of any building upon which a fire escape is erected shall keep the same in good repair and properly painted.

Incumbrance on Fire Escapes.—No person shall at any time place any incumbrances of any kind whatsoever before or upon any fire escape, balcony or ladder.

Another section specifies minimum sizes and methods of construction for these balconies, which are of wrought-iron, as open and as light as their purpose will permit, with vertical ladders, the lowest section of which is removable to prevent use by thieves as an approach from the street.

Other sections provide for automatic sprinklers and stand-pipes and hose for factories and stores and some other buildings. You will observe that the application of this



* By the term "old buildings" is meant those of which the construction was began before—in the case of factories, January 1st, 1892; in the case of workshops and laundries, January 1st, 1896.

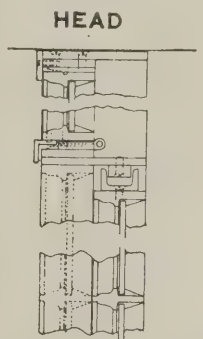
law to dwellings begins when they are occupied by three or more families. This is intended to make it apply to the tenement and flat houses, especially those of the poorer classes, and to prevent the law from being inconsiderate toward buildings less crowded than these. It gives large power and discretion to the Department of Buildings which has not seemed at all times wise.

In regard to factories there are special inspection laws administered by a commission including representatives of the workpeople, which continually supervises such buildings, and no doubt does good work by its own regulations and by its enforcement of others.

The building laws also stipulate the number of staircases according to the size of a building, and in new buildings the fire escapes are often made more substantial and available than the law demands, being built with inclined stairs instead of the vertical ladder. (Mr. Searles Wood illustrated this by an upper floor of a hotel having this feature and also illustrating the operation of the law in regard to the number of staircases and their separation from one another and from the elevators, which regulation applies not only to hotels but to stores, factories and lodging-houses. It demands two lines of stairs continuous from cellar to roof and remote from each other for buildings exceeding 2,500ft. and not exceeding 5,000ft., and an additional continuous line of stairs for each additional 5,000ft. of area.)

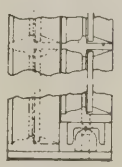
Of course, the law stipulating that buildings must be fireproof if more than 75ft. high applies to factories, a lesser limit being made for certain other buildings; and the fire escape and stair regulations apply whether a building is fireproof or not, the danger from smoke or panic differing but little, in fact, in the two classes of buildings.

It should be remembered that in America the largest factories are often found in new and comparatively small villages. A new industry or a new enterprise frequently creates a new village by the erection of enormous factories in places where municipal and local regulations exist and where the State laws do not apply, and in other cases a small old town getting along very well with practically no building regulations at all is rapidly changed into an industrial centre; and it is not until very much building has been done that the local government seeks to regulate these things.



Here the factory inspection laws in New York and some other States apply, of course, and something is done, but recently there has been a good deal said of the necessity for a State building law to provide for such cases as have been mentioned, and in a little while, no doubt, there will be something of the kind; but at present, if it is proposed to erect a building in a city of 100,000 persons it is usually found that you can do pretty nearly what you please. Sometimes you must file a set of plans with some officer who is not very competent to understand building construction, and sometimes not even that formality is required. Larger cities generally have local building regulations following those of New York, except when local conditions require modifications.

Regulations in Vienna.



The regulations relating to fire escapes in the city of Vienna are as follows:—

Stairs.—In every new building free communication by means of completely fireproof stairs must exist from the garret and from all departments to the house door respectively to the outside and to the cellar. These conditions require, according to the extent of the building, the construction of one or more fireproof main stairs. These stairs must in one-or two-storey buildings have a clear width of at least 1·10 metres, and in buildings with more storeys at least 1·10 metres in the two upper storeys and in the lower ones at least 1·25 metres. In main stairs the straight steps must not be less than 29 centimetres wide, and the width of pointed steps must, at a distance of 40 centimetres from the stair wall, be at least 29 centimetres and at the points at least 13 centimetres. If in a three- or four-storey building one or more by-stairs exist besides the main stairs, these side stairs may serve as main stairs for the two upper storeys if they are constructed of fireproof material, and have a clear width of at least 1·10 metres. The height of the steps must not exceed 16 centimetres in the different storeys and 20 centimetres in the cellar and garret stairs. The stairs must be provided with hand rods, and in the free places with railings of at least 1 metre in height. In fliers these railings must be provided with appliances for preventing the sliding down upon the railings. In the staircases suitable devices for the setting down of burdens must be provided; in four-storey buildings such devices must be in the first and third storeys, and in three-storey buildings at least in the first storey. In special cases or in public buildings or with monumental stairs the Board of Works may dispense with the obligation of providing these devices and the hand rods. The stair landings, as well as the corridors in the extent of the staircase, must be completely constructed of fireproof material. By-stairs for the connection of certain apartments which are also accessible from the main stairs are not subject to above conditions. The employment of trap-doors (horizontal doors) for stair descents is not permitted.

Skylights.—If a staircase is to receive its light from a glass roof the frame of the latter must be of iron, and must rest on all sides upon masonry rising over the surface of the roof. When other places are to be lighted by skylights all connections with the garret liable to catch fire must be carefully avoided. Every glass roof is to be provided with a ventilator, and if necessary the latter again with a guard or grate for safety.

Corridors.—Free corridors (situated on the outside of the walls of a building), if they form the only communication of the apartments with the main stairs, must be built throughout of fireproof materials, and must have a clear width of at least 1·10 metres. Such corridors must be provided with fireproof railings at least 1 metre high or with glass partitions. Open corridors on the top floor must be provided with a fireproof roof isolated from the roof of the building.

Garrets.—The garret room is to be closed by an iron door in an iron or in a stone frame. The establishment of lodgings in the garret room is without exception prohibited.

Party-walls.—Roofs of more than 30 metres length are to be partitioned by walls in the entire width of the garret. These party-walls must be at least 15 centimetres thick, and if necessary strengthened by pillars; they must project at least 15 centimetres over the surface of the roof, and must completely separate the rafters. Each of these party-walls must be provided with an iron door in an iron or stone frame; these doors are to be made so as to close automatically, and their locks must open easily from either side by knobs or handles.

Part Seventh—Industrial Buildings.—Buildings which are considered as Industrial Buildings.—By industrial buildings are understood, contrary to dwellings, all factories, workshop buildings and magazines. Industrial buildings are separated into isolated and not isolated, according to their situation.

Special Regulations for Isolated Industrial Buildings.—The builder and superintendent are absolutely responsible for the observation of the following regulations and precautions:—

(1) In every industrial building consisting of more than one storey a fireproof safety stair in a brick case with fireproof covering must be provided offering a free exit from all parts of the building immediately to the outside. In extensive factories several such stairs must be provided in such manner that no point of the factory is further distant from a safety stair than 40 metres. If a stair of this kind is not intended for the use of more than fifty persons it must, if straight, have a width of 1·25 metres; if it is winding it must have a width of 1·50. For every fifty people in addition the width is to be increased by 15 centimetres, or the number of stairs must be increased accordingly. For greater convenience these stairs and staircases may be built on the outside of the factory upon the isolating space. Besides these fireproof safety stairs, wooden stairs are permitted according to requirement. For localities which are not properly workshops, and which are frequented only at times or in which only a few persons are employed, wooden stairs may also be used.

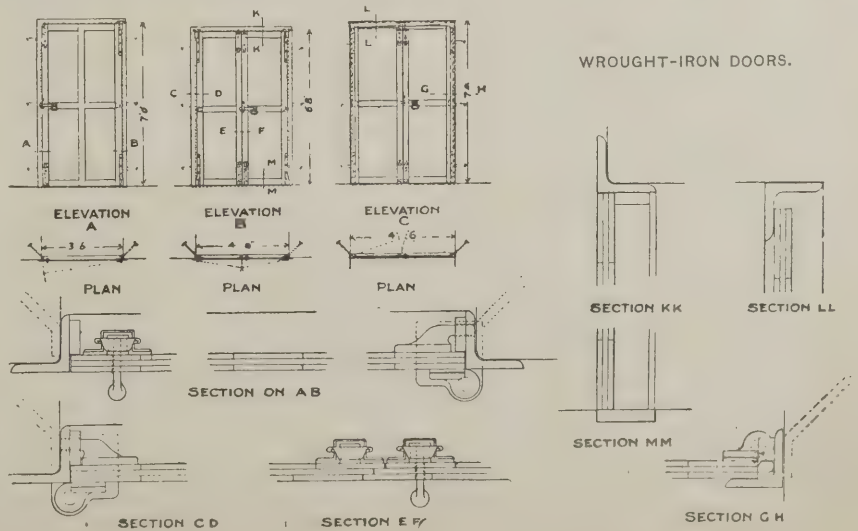
It will be seen from these regulations that they apply to other buildings as well as factories and workshops, and cover nearly as many cases as were contemplated in the Bill entitled the Life and Property Protection Act, 1891.

Fire Offices' Rules.

The Fire Offices Committee, which represents the whole of the Tariff Fire Insurance Offices, have issued the following rules for standard fire-resisting buildings:—

Height and Cubical Contents.—1. Height not to exceed 80ft. measured from the lowest point of the land level or ground line of the site on which the building stands to the level of the highest part of the roof.

2. Cubical contents of any one compartment not to exceed 60,000 cub. ft.



N.B.—In computing the cubical contents of a compartment, the floor area, excluding doorway and window recesses, and the actual height from floor to ceiling are to be measured. Due deduction may be made for a sloping roof.

Walls and Partitions.—3. Brick, terra-cotta and (or) cement-concrete composed of broken brick, burnt ballast, furnace slag, clinker or other similar hard and burnt material.

4. No external area or party-wall to be less than 13in. thick in any part, or if of concrete 20in.

N.B.—Stone used externally only as ashlaring or fencing, with a backing of brickwork not less than 13in. thick, and for dressings, sills, string-courses and cornices allowed.

5. All internal partitions to be of incombustible material, excepting only office

enclosures of hard non-resinous wood with or without glazing.

6. If there is any building adjoining, the dividing or party-wall to extend at least 3ft. above the roof of the fire-resisting building.

Flues.—7. All flues to be built of brickwork no part of which towards the interior of the building is to be less than 9in. thick, and all furnace flues to be lined with firebrick throughout for a distance of at least 20ft. from the furnace. No timber or woodwork to rest in or be plugged into the brickwork of any flue.

Openings in Walls.—8. The total superficial area of openings in each external or area wall of any storey above the ground storey not to exceed one-half of the area of the wall (measured as to height from floor to ceiling of the storey in which the openings occur). All loop-hole or teagle doors and frames and window-frames and sashes to be of iron or other hard metal. All windows above the ground storey to be glazed with glass not less than ¼in. thick in sections not larger than 2ft. super., or wired glass not exceeding 1in. mesh in sections not larger than 4ft. super.

9. Every window or other opening above the ground storey opposing (whether directly or diagonally) and within 20ft. of any window, skylight or glazed or other opening in any other building (whether such latter window, skylight or opening be protected or not), or overlooking (whether directly or diagonally) and within 20ft. of the roof of any building, to be protected by "fireproof" shutters or "fireproof" doors.

Floors.—10. Brick arches, terra-cotta, fireclay or concrete as above described, the floor being in no part less than 6in. in thickness, and carried on metal joists, girders and columns, or brick walls or piers.

N.B.—Floors of wood not less than 9in. thick ceiled with plaster on metal lathing and with the floor boards laid on the bearers without intervening space allowed.

11. Wooden flooring laid on concrete allowed provided there is no space between the wood and the concrete. Wooden fillets not exceeding 2in. deep permitted if bedded flush in the concrete.

12. Scuppers to carry off water, the opening of each of which shall not be less in area than 21in. super., to be provided in the external walls to each floor above the ground storey at intervals of not more than 12ft.

N.B.—In buildings within the city of London or within the area controlled by the London County Council scuppers are not essential.

Roofs.—13. Roofs to be entirely of the incombustible materials as described for floors in Rule 10, except that 4in. be substituted for 6in. in thickness.

NOTE.—*Glass not less than ½in. thick in sections not exceeding 36in. super., and wired glass not exceeding 1in. mesh in sections not exceeding 144in. super., in either case set in metal, shall for the purpose of this rule be deemed incombustible.*

Outlets on to roofs rendered necessary to satisfy the requirements of the Factories and Workshops Acts permitted, provided that all doors and frames be of iron or cased in iron plate at least ⅛in. thick, and that they be self-closing.

Protection of Structural Metalwork.—14. All columns or stanchions to be covered with brickwork or porous terra-cotta (at least 2in. thick), or with cement, concrete or plaster at least 1½in. thick, keyed into metal supports and protected by a metal guard up to a height of not less than 4ft. from the floor where cement, concrete or plaster only used.

15. Girders, joists, lintels and all structural metalwork (other than columns and stanchions, but including framework of roofs), where not covered with brickwork, to be completely encased in porous terra-cotta at least 2in. thick, securely anchored, or cement, concrete or plaster at least 1in. thick keyed into metal supports.

16. Space must be left at the ends of girders and joists to permit of expansion.

Linings and Ceilings.—17. No lining of wood or textile fabric to any part of the walls, partitions, ceilings or roof.

Floor Openings.—18. No openings through any floors allowed except as follows:—

(*a*) Holes to admit driving shafts, pipes and iron or earthenware tubes for electric conductors. Shafts to fit closely in metal collars, and all pipes and tubes to be cemented round the full thickness of the floor.

(*b*) Staircases and hoists of which the enclosures are constructed entirely of brick or cement-concrete as above described at least 9in. thick, with a regulation fireproof door to every opening.

N.B.[1]—Stairs and landings within said enclosures to be constructed of incombustible material.

N.B.[2]—Where the building is within the city of London or in the area controlled by the London Country Council, hardwood doors to openings may be allowed instead of fireproof doors.

N.B.[3]—Where the staircases and hoists extend to the top floors they must have a glass roof protected externally with strong wirework, and the enclosing walls must be carried through and 18in. above the roof of the building.

In factories and workshops in the area controlled by the London County Council a glass roof protected as above is only to be provided in cases where the enclosing walls and staircases are carried through and 18in. above the roof of the building, and also above the roof of the adjoining premises. Otherwise the roof must comply with the requirements of the London County Council.

(*c*) Belting and rope races enclosed as for staircases and hoists.

Shafting through Walls.—19. Shafting where passing through walls to fit closely into wall, or have wall-boxes closed with iron plates not less than ¼in. thick, leaving no open space.

Pipes and Electric Conductors.—20. All pipes in the building, except water pipes not exceeding 1½in. in diameter, to be of hard metal. No wooden casing to be used for enclosing electric conductors.

Communicating Compartments.—21. Two or more compartments, each constructed in accordance with these rules, may communicate, whether by double fireproof doors or otherwise, provided that their aggregate cubical contents do not exceed 60,000 cub. ft.

22. Two or more such compartments whose aggregate cubical contents exceed 60,000 cub. ft. can only be allowed to communicate across a fireproof compartment built up from the basement with walls of solid brickwork, and constructed in all other respects in accordance with these rules so far as the same are applicable, and having all openings protected by fireproof doors at least 6ft. apart.

23. Except as above, no communication allowed between a compartment constructed in accordance with these rules and any other building or compartment.

To illustrate the regulations of the London County Council I give a block of two factories belonging to the same owner (see plan on this page); they have the London County Council staircase in each building, which in each case is carried up to the roof, and by means of iron staircases either staircase can be used as alternative means of escape.

The arrangement of the closets on the landings is the usual one in London factories where space is limited, as it gives the lobby required by the Factory Act and the external windows required by the Public Health Acts. Each closet is treated as a separate room, and has its own 2ft. super. window, though usually the divisions do not extend up to the ceiling. The sink is placed in the centre division to help light the staircase, and often the closet doors open in the space, which perhaps is better, as in a panic the people might be pushed into the closets, where the doors are on the side of the landing—no door is allowed to open over the landing, so that the doors would give to pressure. The third staircase on this place is made with enclosing and newel walls of Jhilmil lathing and granite plaster carried on iron framing, which also supports the staircase of 2in. solid oak; this form of staircase is similar to that described in section 7 of the regulations.

To illustrate the rules of the Fire Offices Committee I give a plan (see opposite page) of a factory designed by Mr. Lewis Solomon, F.R.I.B.A. This shows the 6ft. wide fireproof lobbies to the staircases and lifts that these regulations require, which are an advance on the London County Council

regulations; the other arrangements in the factory are very good, the position of the lifts in relation to the staircases is much better than in the other plans, and the water-closets are not off the staircases; a mess-room is provided off the staircase so that the hands can take their meals away from the workshops.

The illustration on p. 101 shows the best method of making an iron-frame window open in accordance with the regulations; it runs on an iron bar and, unless in a very exposed position, is sufficiently water-tight.

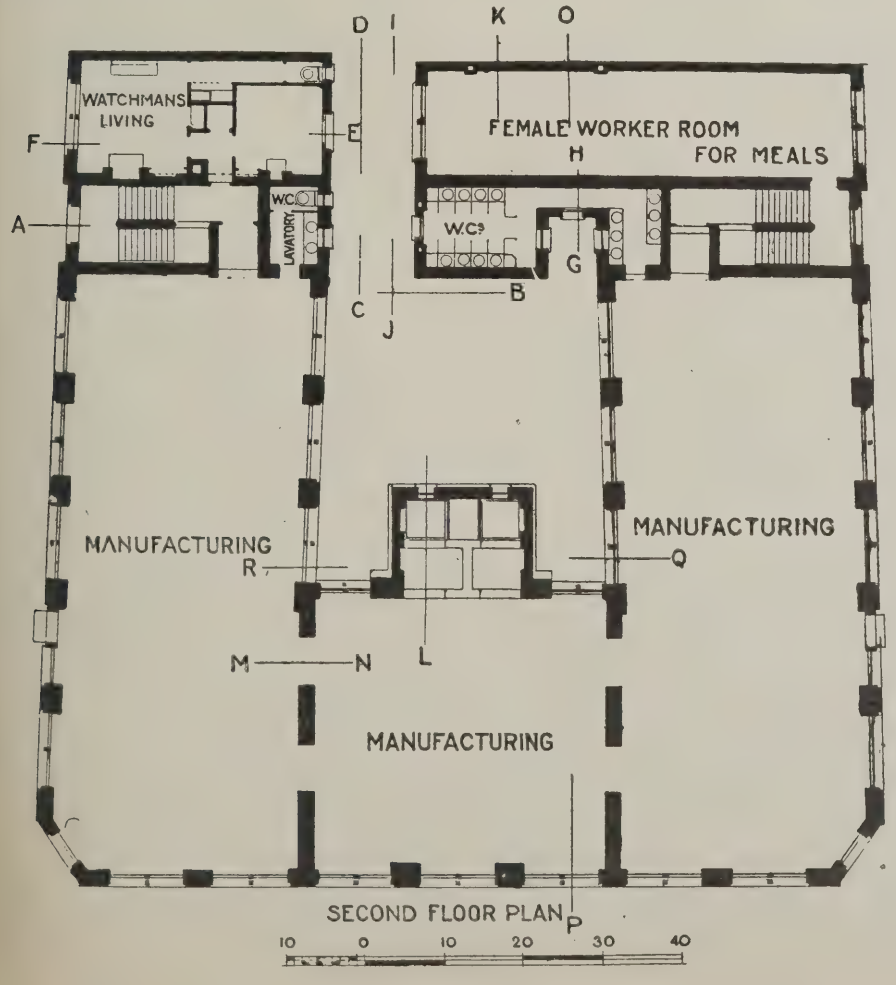
The iron doors to the lift enclosure are also shown on p. 101, with the different hangings.

As these fireproof staircases have to discharge into the street when the sites of factories have only one frontage and the lighting of the premises is principally derived from this frontage, it is a serious consideration to take 11ft.—the least width a brick-enclosed staircase can be made—out of each frontage; a joint staircase, to be used in common by two factories, has been allowed by the London County Council, and as this quesion is being raised every day this principle will have to be admitted, and may be extended. I am of the opinion that, under certain conditions, balconies on each floor communicating with a public staircase serving several factories would be a reasonable thing to allow.

I have tried to show what the most recent practice in providing means of escape from fire in accordance with the provision of the Factory Act of 1901 is, and, in conclusion, I trust that the information collected may be of some little use.

[The American buildings being very different to any we have here, Mr. Searles Wood gave a plan of one of them (which we are unable to publish but which will appear in the Journal of the Sanitary Institute). The following particulars may, however, be given:—

The corridors are lighted partly by elevator shafts, which are always constructed in open grille work or glazed grille work; also at the staircases and at the end parlours, which are practically continuations of the corridors without intervening doors. The fact that the corridors and halls are warmed equally with the rooms make the doors of less importance, and, except in rooms strictly private, the doors habitually stand open or are omitted. Then, over every door is a transom light of glass, which lights the corridor and affords cross-ventilation in the rooms; in summer this is essential. In hot weather all windows and these transoms are wide open, and whatever breeze there is comes clear through the building. The closets have sashes high up in the wall to afford light and ventilation, as the transoms do to the walls.



A shaft, 10ft. by 8ft., ventilates the kitchen, which is itself 100ft. long, with all departments, from the butcher's shop to the ice-cream pantry, separated by wire screens, each department having its refrigerator system cooled by brine from the engineer's department. All these being in the basement would get very warm (in some buildings the heat is almost intolerable); to obviate this the large shaft is used.

Other vents are provided for the dining-rooms and restaurants and the laundry and elevator machinery; the latter to check the tendency of the oily smell to rise in the elevator shaft proper.

The heating is by steam to direct radiators placed in each room. In winter this steam is used for power purposes first at 90lbs. pressure and then reduced to 5 or 6lbs. sent through the radiators; in fact, these act as condensers to the engines.

In summer the steam after use in the engines is condensed in feed water, and in some parts wasted. The power system is electric, three generators similar and with parts interchangeable; water current, which runs the elevators and all the other machinery, as well as lighting the building. The steam is made in two water-tube boilers under the side walk.

A pantry is provided on each floor for the use of servants for the distribution of drinking water and other sundries and service in private rooms. Ducts and wires are provided for the main cables of the lighting system, with their switch-boxes, fuses, &c., and for the telephone and bell-wire mains. To all of these things frequent access is necessary, and they are so placed in shafts adjoining the staircases.]

SECOND FLOOR PLAN

New Patents.

These patents are open to opposition until October 27th.

1902.—Surveying Instruments.—3,862. J. R. Hagan, North Lamoine, Maine, U.S.A., and others. The instrument consists of a base rule having a slide on it that carries the perpendicular rule, while at one end of the base rule is a spirit-level, a protractor and a hinged angle rule. This last crosses the perpendicular rule, and the two can be held together at any point by a clamp. The instrument may be used with or without the supporting staff.

Waterproof Wallpapers.—10,510. H. W. Sanderson, Hazeldene, 57, Harvard Road, Chiswick, and E. E. Humphrey, 51, Mansfield Road, London, N.W. The paper is exposed to the action of a solution of formaldehyde, or tannin, or chromic acid and chromates. This renders it washable.

Telescopic Levelling Staves.—15,165. J. B. Young, 46, Dean Street, Newcastle-on-Tyne. A flexible tape is attached to the outer case and is graduated so as to read continuously with the latter. It passes over a roller down into the inner length and has a weight on the end to keep it taut. The object of the invention is to enable readings to be made in confined spaces, where it is only possible to partly extend the staff.

The following specifications were published on Thursday last, and are open to opposition until November 3rd next. A summary of the more important of them will be given next week. The name in italics is that of the communicator of the invention.

1901.—16,738, Mobus, pile drivers. 16,954, Keane, cowls. 17,048, Lake (*Boullet*), smoke-consuming apparatus. 17,106, Lacroix & Brisselet, keyhole protectors. 17,296, Strube, grooved tiles for roofs. 18,061, Schofield, excavator for trenches, cuttings, &c. 18,518, Tournant, portable sheds or roofs. 19,052, Foxworthy & Moore, boiler flue arches. 20,618, Saunderson, pumps. 20,769, Crichton, pipe-testing machines. 21,147, Bradley, high-pressure water taps. 21,148, Bradley, high-pressure water taps. 21,235, Power, tiling of grates. 21,340, Nickerson, keys for adjusting the joints of mathematical compasses, &c. 21,502, Riddel & Robertson, jambs of metal mantel register grates. 21,829, Rhodes & Gaunt, syphonic flushing apparatus.

1902.—2,496, Hine & Waters, chimney cowls. 2,798, Gunn, chimney top and ventilator. 14,518, Pfister, impregnating and dyeing timber. 16,181, Brandell, drawing compasses. 16,259, Adams, kilns.

A Board School Competition.—The design of Mr. D. Forbes Smith, A.R.I.B.A., under motto "X," has been unanimously selected by the Kirkcaldy and Dysart Landward School Board for a new school at Boreland in a competition limited to the architects of the district.

Keystones.

Mr. Alfred Waterhouse, R.A., is improving in health steadily, and he is able to take frequent drives in the district around his Berkshire home.

A New Baptist Church in Streatham, S.W., has been erected in Lewin Road from designs by Messrs. George Baines, F.R.I.B.A., and R. Palmer Baines, of 5, Clement's Inn, Strand, W.C. It is Decorated Gothic in style, with a square tower and spire at one side. The facings are of red bricks and the dressings of white Costessey stone. The roof is open-timbered, of hammer-beam form. The cost has been about £3,100, exclusive of seating. Messrs. Johnson & Co., of Wandsworth Common, were the builders.

Excavations in Tinos.—M. Demoulins, a Belgian, has recently made some excavations at Kionia, somewhat west of the modern town of Tinos on the island of that name, and has discovered the remains of the ruins of the temple consecrated to Neptune and Amphitrite, the portico of which he has found some 40 metres from the sea, measuring 22 by 4 metres, also a portion of the actual temple itself, to the extent of a building of 20 by 15 metres, surrounded by a basement. He also reports numerous inscriptions and figures of sea monsters.

Sanitary Awards.—Mr. John Jones, of Church Street, Chelsea, S.W., has received the following awards (the highest in their respective classes) from the recently held Sanitary Institute Congress and Health Exhibition at Manchester, for articles of his manufacture:—A silver medal for patent automatic airtight double-seal manhole covers; and bronze medals for patent air inlet ventilators, the "Carlyle" wash-down pedestal closet in vitrified stoneware, and a patent brass socket for connecting waterclosets to soil-pipe branch.

The New Rome.—His Majesty's Consul at Rome, in his latest report, remarks that visitors who have not been in Rome for the past twenty years can hardly recognise it. Suburbs have risen over the vineyards outside the city walls; old quarters have been superseded by large and commodious buildings; the Tiber is permanently embedded all along its urban course between two gigantic embankments on which fine houses, overlooking the river, have been constructed; solid granite bridges, meant to defy the ravages of time and the impetus of the once dangerous Tiber, have been thrown across the two embankments; new and wide thoroughfares have been opened; in one word, the city has been completely modernised and rendered in all respects quite sanitary, as shown by the returns of mortality.

The South-western Polytechnic, Manresa Road, Chelsea, has commenced its autumn term. The day school pays special attention to fitting students for their work in after-life, third- and fourth-year boys being allowed to devote their attention to such subjects as mechanical, electrical and civil engineering, building trades, chemical trades, &c. The day college for men above the age of sixteen has a course extending over three years. The term commences on Monday, September 29th. The term for evening classes commences on Monday, September 22nd, and the technical subjects embraced are very comprehensive. Mr. Banister F. Fletcher is the lecturer in architecture, Mr. E. L. Bates in brickwork, Mr. T. Edwards in carpentry, Mr. T. J. Evans in building construction, Mr. S. C. Fairchild in plumbing, Mr. A. Foster in plastering, Mr. W. H. Knight in sanitary science, Mr. J. L. Luckis, F.S.I. in builder's quantities, and Mr. L. C. Radcliffe in house decoration, painting, &c.

A Vestry Hall and Offices at Norton, Sheffield, are to be erected from plans by Mr. Joseph Norton, architect, of Norton Woodseats, Sheffield, at an estimated cost of £5,000, inclusive of site and furniture.

Mr. F. W. Bullock has been appointed building inspector to the Repton Rural District Council for three years to examine and report upon plans sent in for the approval of the Council under the by-laws relating to new streets and buildings.

St. James's, West Malvern.—This large stone mansion has been altered into a school under the direction of Mr. Mark H. Judge, and a pamphlet describing and illustrating the buildings and the grounds has been reprinted from "The Bungalow" (7, Pall Mall, S.W.), price 1s. nett. The letterpress is by Mr. Max Judge, who took some of the photographs reproduced, the remainder of them being by Messrs. Bedford, Lemere & Co.

The School of Art Wood-carving, South Kensington, which now occupies rooms on the top floor of the new building of the Royal School of Art Needlework in Exhibition Road, has been reopened after the usual summer vacation; and some of the free studentships maintained by means of funds granted to the school by the Technical Education Board of the London County Council and by the Drapers' Company are vacant.

A New Cottage Hospital at Exmouth is being erected facing Marpool Lane. The building will have a frontage of 110ft., and comprise, on the ground floor, two main wards, 30ft. by 20ft., providing accommodation for six beds each, special wards, convalescent rooms, surgery and surgeons' room, matron's room, &c.; bedrooms for nurses and matron on the first floor, and kitchens and offices, with serving lifts in connection with the ground floor and basement. A detached building will provide a mortuary and post-mortem room. The walls will be of local bricks and the roof covered with Broseley tiles. A wide verandah will extend along the greater part of the main front. The cost will be between £3,000 and £4,000.

London County Council Camberwell School of Arts and Crafts.—This school, which is situated in Peckham Road, S.E., will be reopened for the sixth session on Monday, September 22nd. The classes in architecture and building construction are directed by Mr. A. Wickham Jarvis, A.R.I.B.A., while those in masonry, plasterers' work, &c., are directed by other capable instructors. Mr. Albert Toft supervises the modelling class. When the school extension, the foundation-stone of which is to be laid next month, is completed, it is hoped that classes will be formed in brickwork, carpentry, plumbing, wrought-iron and stained-glass work, &c. Full particulars may be obtained from Mr. C. H. Johnson, the secretary of the school.

Dunstaffnage Castle Restoration.—An appeal is being made to Scotsmen to see that their old castle of Dunstaffnage, where the Coronation stone was kept for centuries, does not fall into ruin. One tower has fallen. The roof is gone from the keep, which was inhabited up to 1810. Each year's rain and frost does further damage to the walls. The gate money, sufficient at Carisbrooke to keep the castle there free from further decay, cannot be raised at Dunstaffnage, the ordinary tourists not taking sufficient interest in Scots national history. A sum of £3,000 or £4,000 would guarantee keep and walls for a long time, and would provide a museum, like that at Carisbrooke, of documents and relics connected with the history of the castle, attractive enough to provide entrance fees sufficient for future upkeep.

Builders' Notes.

Mr. John Biscomb, senior partner in the firm of J. & T. Biscomb, builders, &c., of York, died last week at the age of sixty years.

A Fatal Crane Accident occurred last week at the quarry belonging to Messrs. Akeroyd & Sons at Southill, near Batley. While a crane, with a lifting capacity of 25 tons, was drawing a stone weighing between 10 and 12 tons it collapsed. The boiler and crane fell to the bottom of the quarry, killing 4 men and injuring 2 others.

The Smoke Nuisance: What the London County Council did last year.—Last year 819 reports of cases of smoke nuisance, of which 541 were serious in character, were sent to the Borough Councils by the authorities at Spring Gardens. Statutory notices were served in 475 cases, and legal proceedings taken in 119; while the number of cases in which convictions were obtained was 106, fines being imposed to the amount of £550.

A Large Timber Fire.—A great fire occurred last week in the large wharf at Victoria Docks occupied by the Acme Wood-Flooring Co., many thousands of tons of valuable timber being destroyed and over £100,000 worth of damage being done. Smoke was first noticed rising from the roof of a large shed containing a quantity of wood-cutting machinery. Eighteen engines, three river-floats and 200 firemen were engaged in fighting the flames, which had spread to the huge stacks which surround the building, over an area three acres in extent, and all were totally destroyed. The loss is fully covered by insurance.

A Builder Accidentally Killed.—A Kidderminster jury recently found that the death of Mr. James W. Jones, a well-known builder of that town, was due to accidental causes. While superintending operations on a high scaffolding some weeks ago Mr. Jones slipped and fell to the ground, receiving injuries from which he died. A vague suggestion of some mysterious circumstance in connection with the fall had been made, prompted apparently by the fact that Mr. Jones was the secretary to the Master Builders' Association, and therefore took an active part in the recent dispute between employers and men, concerning which there has been much bitter feeling. At the inquest, however, there was no evidence to show that death was other than purely accidental.

A Building at Shipley collapsed last Thursday. The Junction Hotel, situated at the junction of Westgate and Commercial Street, was being entirely rearranged in the interior. Messrs. Rhodes Brothers, contractors, Shipley, had for some weeks been busy carrying out the alterations according to the designs of the architect, Mr. Winn. Scarcely anything of the interior was left standing, just one room being left intact so that business might not be completely stopped. That portion of the hotel abutting on the premises of the Windhill Co-operative Society had been added to the original building, having formerly been used as a shop. It was in this part of the hotel that the accident happened. Eight or nine men were at work rebuilding a displaced portion of the wall at the end of the building adjoining the Co-operative Hall when the end wall fell and brought down with it the roof covering that portion of the building. Five of the men were struck by falling timber and masonry, but two escaped with only very slight injuries. The breaking or crumbling of an old beam of large size that supported the end of the building, and which itself had been propped up, is supposed to have been the cause of the accident.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
	BUILDING:		
Sept. 25	Rainhill—W.C. Block	Lancs Asylums Board	J. Gornall, Clerk, Rainhill Asylum.
" 25	Bristol—Repairs, &c.	Municipal Charities Trustees	Foster & Wood, 35 Park Street, Bristol.
" 25	Brynnan, Wales—School	Llanharran Urban District School Board.	L. V. Evans, Court House, Pencoed.

An Architectural Causerie.

Liverpool Cathedral Competition. Surprise at not seeing more Renaissance or Classic designs—those that are such being neither commanding nor remarkable; Gothic predominant and therefore apparently the style from which it would be practical to select; the majority of designs having plans more or less like mediæval cathedrals, with—for the purposes of the English Church—too many chapels clustering around the east end of the choir; the danger of being tricked by a clever drawing of a poor conception; the 103 sets of designs submitted consisting of thirty-three expressly prepared, twenty-three mostly sent in for other large churches in different parts of the world, and the remainder a miscellaneous collection of photographs, drawings and sketches, many of them just gathered together as they lay handy—with little thought or discrimination—and tied up in portfolios; a selection of five and an honourable mention of eight men. Thus may be summed up the report of Mr. Bodley and Mr. Norman Shaw on the preliminary competition for Liverpool Cathedral. It can be read in full on p. 110 of this issue. There is not much to say about it, though we may mention that in our own selection of the designs (see the issue for July 30th last) three out of the five chosen numbers were given. Many well-known architects entered for the competition and many of them are not mentioned—honourably or otherwise—they simply form part of the "remainder," and there is no need to worry about the hindermost being looked after by at least some architectural representative from the Lower Regions. But it is the second competition which will show whether we are capable of producing a really fine modern cathedral. It will be a costly one, and the Committee will need a good many more money-bags to carry out the work as it deserves. At present they have hardly £155,000, out of which £11,300 will need to be paid for the site, a thousand guineas to Mr. Bodley and Mr. Shaw, and at least another fifteen hundred guineas to the competing architects; which leaves about £140,000 for the fabric itself. When the accepted design is exhibited it will be time enough to judge how much of it could be built for that sum.

Paris Architects' Fees. After considerable discussion it has been decided that the fees paid to architects engaged on public works in Paris shall be according to a sliding scale, so that the percentage on the most important buildings will be less than that for the smaller works. In future the commission on all buildings costing more than about £30,000 will be at the rate of 4 per cent.; those between £25,000 and £30,000 at the rate of 4½ per cent.; those

485, COMMONWEALTH AVENUE, BOSTON, U.S.A.
R. C. STURGIS, ARCHITECT.

between £15,000 and £25,000 at the rate of 5 per cent.; those between £8,000 and £15,000 at the rate of 5½ per cent.; and 6 per cent. for all those buildings costing less than £8,000. The ordinary rate of commission throughout France is, as in our own country, 5 per cent.—in fact, French custom had settled this before the R.I.B.A scale was introduced. This newer scale is, however, instructive, and architects will doubtless be interested in it; but, though the percentages are so carefully adjusted, the scale is subject to alteration by the Administration, who reserve the right to increase or diminish the amount of commission as they think expedient in particular cases.

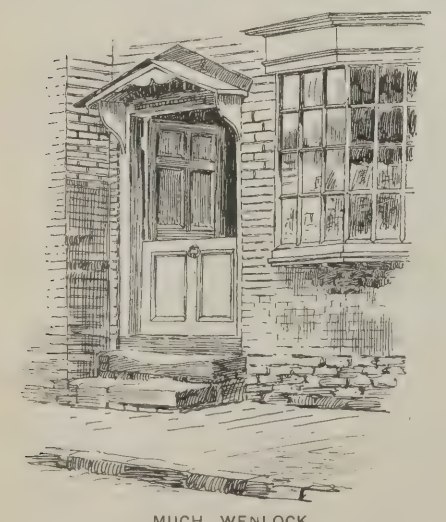
An American House. The illustration on this page shows a town house by a prominent American architect, and is a good example of the more refined work done on the other side of the Atlantic; there is indeed a marked austerity about the building, the ornamentation being confined to the string-courses at the top and bottom, three keystones, and the very delightful doorway. The design is eminently French in feeling and exhibits those academic qualities characteristic of French architects, though the two small bay windows on the first floor are somewhat of a novelty. Altogether the house is one that looks well when fresh from the builders' hands, and one likely to weather into a most charming piece of work.

Sydney's Great Bridge. The Advisory Board appointed to deal with the designs and tenders for the great high-level bridge that is proposed to be built across Sydney Harbour has issued a report which furnishes the following interesting facts:—Fifteen tenders were sent in, three of which were laid aside as informal, while of the remainder the Board appeared to favour the design of a French company—the Fives-Lille Co. of Paris—but reported that the amount of the tender (more than three millions sterling) was prohibitive. Other designs were also laid aside on account of cost, others again for æsthetic considerations, leaving three only which, with certain modifications, came within the required conditions. These three designs consist of one by Messrs. Arrol & Co., Ltd., Glasgow (£1,221,152); a cantilever design of Messrs. J. Stewart & Co.; and a design of the E. and C. Bridge Co. (£1,843,855). The three firms have been asked to submit amended tenders by January 27th next. It will be seen, however, what a great undertaking this bridge must be in any case.

Engineers for South Africa. Many of our young architects and engineers have long been thinking of South Africa as a free field for their energies. We have ourselves published certain facts for their benefit, and these we now supplement by the following remarks of a man on the spot—the special commissioner sent out by the "Engineer," who, writing from Cape Town, says:—"The man whom I recommend to take his chances in Cape Colony is the young and energetic engineer who has worked his way up to that sticking point, arrived at by so many, where, after having acquired a thorough knowledge of his particular branch, he can see no prospect of material advancement at home for many years to come. If such a young man will come out here with sufficient money—say £200—to enable him to live for a few months while he is looking about for employment and taking his bearings, his chances in the long run might be good. But he must be prepared to take a position out here at much the same level as that which he gave up at home, or perhaps a little lower down on the ladder, and from there he must work his way up. When he has shown himself capable, his advancement should be much more rapid here than at home. To such a man I should say come to Capetown rather than to Johannesburg in the first place."

SOME ENGLISH DOORHEADS.

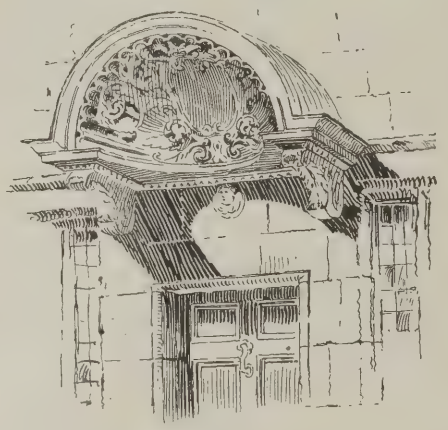
By JOHN HUTCHINGS, A.R.I.B.A.



JUST as the hearth has become the central and most important object of the interior of our homes, the entrance door with its porch is usually the most prominent external feature. A rectangular hole in a wall appears to have been the primitive form of entrance, but from remotest time efforts were made to ornament and embellish this opening. The Egyptians added dignity and importance to their gateways by flanking them with huge pylons;

THE READER'S HOUSE, LUDLOW.

they also employed the portico and colonnade as a decorative feature, which in the hands of the masterful Greeks reached such a degree of graceful perfection. The mediævals lavished all the resources of sculpture and carving at their command upon the gateways of their churches, and in humbler fashion they ornamented the domestic door with bracket and spur, quaint notchings and heraldic devices.



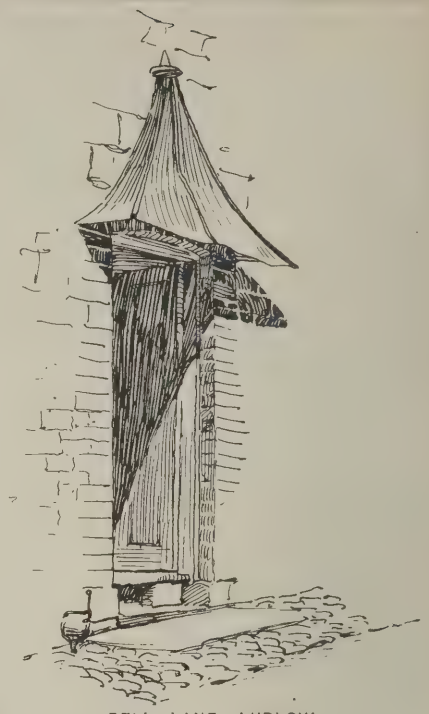
It was left, however, to the Renaissance craftsman to develop this particular adjunct as applied to the cottage and the middle-class house; and while the more grandiose structures of this period too often fail to impress or interest, the simpler porches of the people possess all the charm of suitability of purpose and originality of conception. Even in the later Georgian period, when the coped parapet took the place of the broad eaves cornice, the glory of the previous era, and plain rectangular holes in the walls were deemed to satisfactorily answer the purpose of fenestration, the entrance was almost always quiet and well-proportioned, often elegant and suitable in design and sometimes combined with these qualities a vigorous, picturesque originality.

MUCH WENLOCK.

Walk down Essex Street, Norfolk Street, Queen Anne's Gate and any other thoroughfare of equal age in London, and try to imagine the dull monotony that would prevail if unredeemed by the porches supported by bracket, pilaster and column and decorated with delicate acanthus, honeysuckle and other well-known classic ornaments, that relieve the bare wall-surface. Such would be the mournful appearance of our provincial streets—in a lesser degree, it is true, thanks to creeper and lichen, those acquisitions of age denied to the less fortunate town mansion—if our old brick towns were stripped of these accessories. They would certainly loose three-fourths of their interest.

The most primitive form of structural porch is a slab of slate, stone or wood supported upon two bearers built into the wall;

OXFORD.



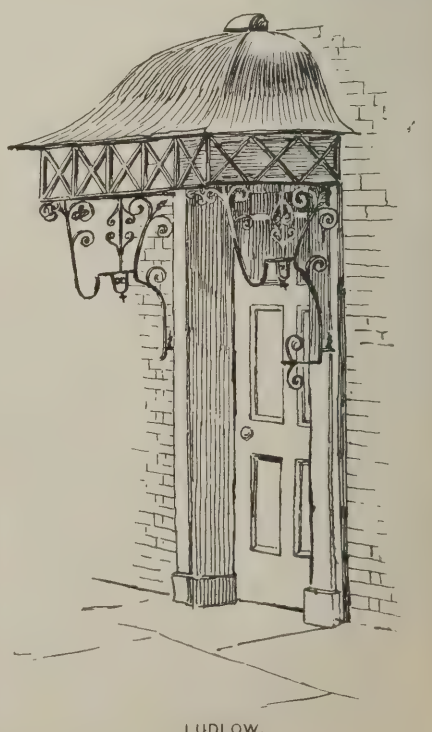
or two sloping slabs forming a gable, supported in the same way. These two are the parents of an infinitely varied offspring, of which each may be classed as belonging to the family of gables or flats, though the domical or curved shape may be regarded as a new departure.

Let us follow the development of the slab supported at each end by bearers. In the early examples the sustaining members are roughly squared; in some the slab has a slope forward to throw off the rain in front. But, with the progress of decoration and the acquisition of means, the supports were carved into rough-curved shapes, into grotesque heads, and, as knowledge and skill increased, into graceful brackets and elegant shafts. The slab itself, no longer a thin slice, is thickened out and wrought into all manner of forms and decorated with mouldings and foliage. Sometimes it is hollowed out into a quarter-dome, sometimes wrought into an arch.

The gabled variety undergoes a similar metamorphosis until its stately and finished proportions almost entirely obliterate its mean utilitarian origin.

The peasant surrounds his door with lattice-work, which, in a season or two, becomes gay with rose, honeysuckle and jessamine, a natural decoration more appropriate to his whitewashed walls than any masterpiece of the craftsman.

Besides the mason, the carver and joiner, the worker in metal evolves his own idea in his own way, at first assisting the joiner; but becoming bold by experiment, also launches



BELL LANE, LUDLOW.

out independently and with the happiest results.

Apart from a few brilliant exceptions, the architecture of the Renaissance, the period to which we will confine ourselves at present, was so stilted and academic that one has to search amongst the work of the village craftsman and the obscure practitioner for work of a lighter and more varied type; in short, amongst those whose imaginations were unfettered by the stiff scholasticism of the fashionable designer, and to whom the art of conceiving appropriate forms was an inherited gift and a delightful exercise rather than a laborious effort after artificial ostentation.

The majority of the examples here illustrated are taken from Shropshire, though most of the forms are common to other parts of the country. In selecting them preference has been generally given to simple and unpretentious types. One of the specimens from Much Wenlock illustrates a direct and inex-

LUDLOW.

pensive expedient for protecting the doorway from the weather. It consists of a horizontal board, supported at each end by shaped brackets. Another example from the same place shows an artistic development of the same idea. The gabled type previously referred to is also found here in almost primitive simplicity and makes an interesting comparison with the more finished porch from Newcastle. The doorway of the Reader's House, Ludlow, exemplifies the kind of work executed by the provincial carpenter when classic influence in sadly corrupted form first reached the artizan class. The structural lines are still the old national vernacular, but foreign detail is crudely introduced in the lintel and the ornamental filling below. Ludlow possesses a remarkable number of fine

NEWCASTLE (STAFFS).

wooden porches and some exceptionally interesting examples of metal applied to the same purpose, two of which latter are given among the accompanying illustrations.

Another motive is apparent in the quaint combination of door and windows surmounted by a plaster cove and tiled roof, which transforms an otherwise plain cottage into an object of beauty (see next page). The letter B, presumably the initial of the builder, is curiously worked in the glazing bars of the fanlight.

The elaborate arched hood adorns the front of a formal three-storeyed brick building in Bewdley (see next page). This erection is more ostentatious than the others, and cannot be regarded as an unmixed structural success, and though striking in form and rich in detail it is scarcely a triumph of artistic design. The three-quarter columns of the Ionic Order were evidently introduced at the dictate of the prevailing passion for the Orders, rather than for any instinctive idea of appropriateness.

Oxford provides a more satisfactory specimen of this type of porch, and though later in date the Newcastle example fulfils all the requirements of the problem in a simple and fitting manner.

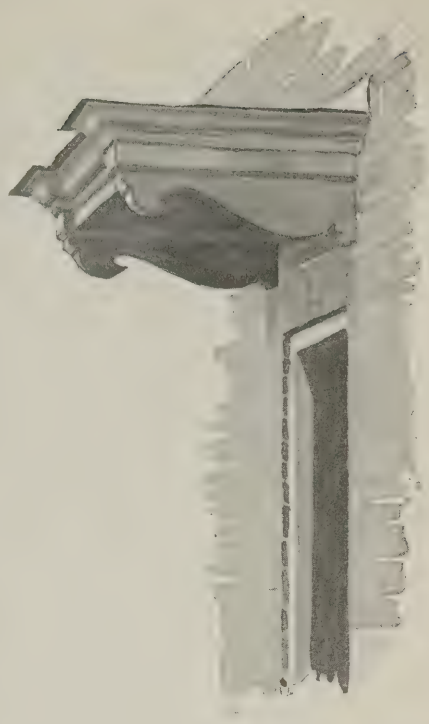
This meagre collection of porches gives but the faintest idea of the beauty and variety of the door-heads to be seen in the old towns throughout the length and breadth of our land, but they afford some conception of the versatility and ability of that now almost extinct class of artizans who worked with their brains as well as with their hands, and who had a genuine perception of grace and beauty—that noble faculty, no longer the blessed possession of the many but of a small and privileged few.

R.I.B.A. Standing Committees.—The new appointments include Mr. W. Flockhart and Mr. Walter Millard on the Art Committee; Mr. Butler Wilson on the Practice Committee; and Mr. J. Fletcher Moulton on the Science Committee.

EVESHAM.

Spoiling the Old with the New.

THE Society for the Protection of Ancient Buildings is exercising itself in regard to some proposed alterations in the more ancient parts of Evesham. Mr. Thackeray Turner, the secretary, says :—



At the present time the Market Square contains scenes of the greatest beauty and interest. There are few more beautiful and venerable groups in this country than the old buildings in the north-east corner, where mellow mediæval walls and grey mottled roofs are pierced by the dark Norman gateway and surmounted by the quaint grey spires of the two churches, with the many-pinnacled tower of the Abbey to the left. In walking from the end of High Street towards the Abbey every yard develops a fresh combination of these groups of the greatest variety and interest; and the same may be said of the views in returning from the archway towards the old Booth Hall. The charm of these scenes depends in a great measure on the fact that the commonplace modern buildings on the east side of the Square cease about half-way along it, and the next to them is a very excellent example of the old half-timber houses of Worcestershire, with tiled gables and old-fashioned windows, which is low enough to allow the grand old bell-tower of the Abbey to be seen above it, and is ancient enough to agree in sentiment and in tone with the whole scene. My committee has learnt with extreme regret that this house is to be destroyed in order to make room for an extension of the modern brick library and corn exchange.

Similarly utilitarian methods have swept away the remains of Evesham Abbey in past centuries, and those who defend the present schemes of destruction have no right to criticise the vandals who have shorn Evesham of its former architectural glory.

My committee also regrets to notice that in a newly-published guide to the town it is taken for granted that a "modern improvement" which lately involved the removal of a good piece of old domestic architecture on the left of the passage leading to the square is less regrettable because the building that replaced it is "a half-timbered and gabled building which evinces a successful effort to effect modern improvements in a style harmonising with and characteristic of the best architectural features of the town." The fact is that to those who have any real grasp of the meaning and value of old architecture it is only an aggravation of the loss, and no compensation whatever, to see it replaced by a modern imitation. The

MUCH WENLOCK.

MUCH WENLOCK.

attempt in the present time to copy or imitate old half-timber houses such as Evesham is fortunate enough to retain never is and never can be satisfactory, but this fact alone ought to be enough. Everything that makes the old work precious or beautiful is the outcome of conditions which have long passed away and cannot be recalled. The abundant supply of massive oak timbers, for example, which made such buildings possible no longer exists, and the thin veneer of sham timbers which has rarely anything to do with the construction and is the only means a modern builder can afford in the direction of copying "half-timber" work is both pitiable and contemptible.

The committee was very sorry to find that the same guide-book refers to the old Booth Hall in the following terms: "The position of the old Booth Hall is a very inconvenient one, and the spirit of improvement which marks the recent progress of the borough may at no distant date demand its removal. We therefore perpetuate its memory by an illustration."

The Evesham Booth Hall is certainly one of the finest and most unspoiled buildings of its class in the county, and it is lamentable to find that in the community that should be most proud of it, and the most anxious to protect and preserve it, such words should be possible. It is very much to be hoped that they do not reflect the views of the people of Evesham.

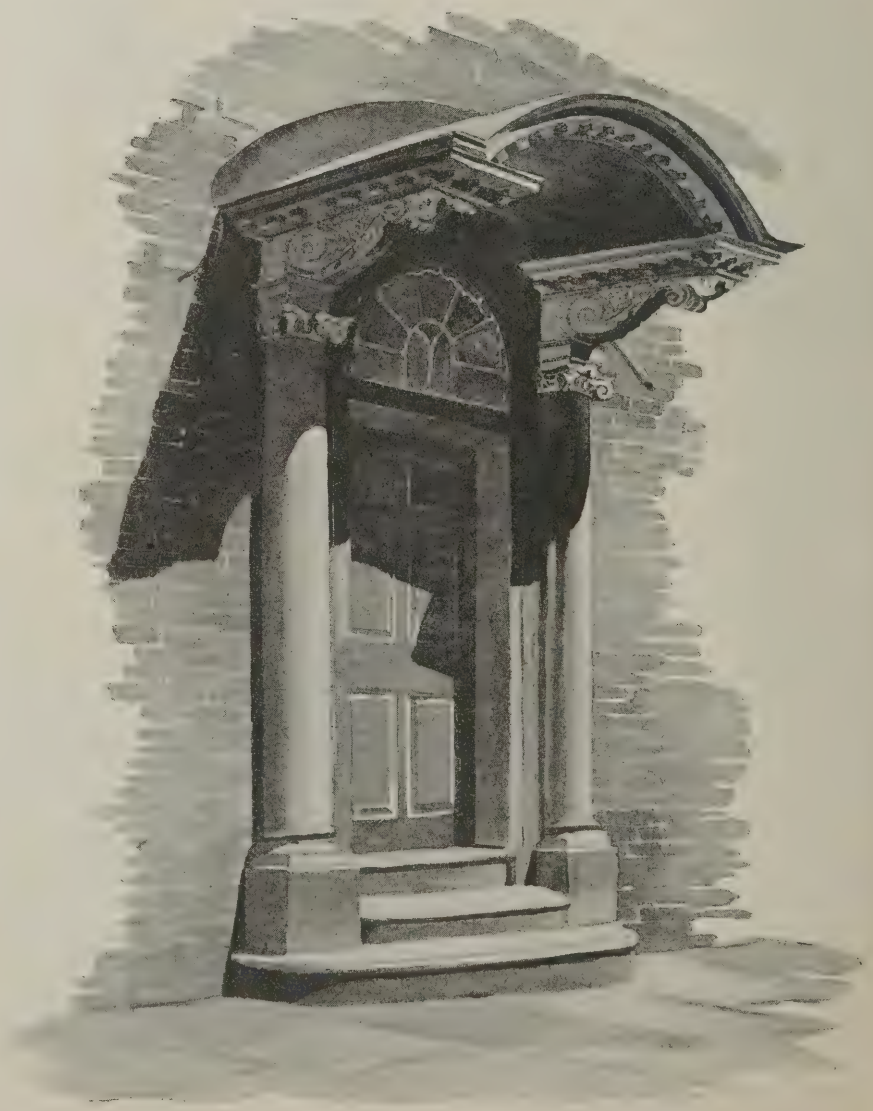
Disclaimers.

In reply to the foregoing remarks the "Evesham Journal" says: "Mr. Turner appears to be alarmed at some threatened destruction of the 'venerable group' of buildings at the south-east (not the north-east, as he puts it) corner of the Market Place. Well, we agree that the really 'ancient' buildings in this corner—Abbot Reginald's Gateway for instance—should be sacredly preserved. But, so far as we know, the apprehended 'destruction' is purely imaginary. For the circulation of light and air and the preservation of the health of the people who have to live in this 'corner,' a little clearing-out would in the minds of all who are not crazy on the matter of 'preservation' be commendable; but we are not aware that even this is in contemplation.

DOORWAY AT LUDLOW. DRAWN BY JOHN HUTCHINGS A.R.I.B.A.

Next the assumed intention to 'destroy' the house adjoining the public library in order to increase the accommodations of this most useful institution terribly arouses Mr. Turner's susceptibilities. The false sentiment of this is truly pathetic. What can be reasonably discovered in this dilapidated tenement to make its removal for the extension of the library a matter to weep over? It is gabled and tiled, has old-fashioned (not so very old-fashioned either) windows and is largely constructed of lath and plaster. It may be 200 years old. What in the name of common-sense can be said of an outcry to preserve this place as an obstacle to a necessary extension of a most valuable public institution? . . .

"'Similar utilitarian methods,' Mr. Turner informs us, 'have swept away the remains of Evesham Abbey in past centuries.' Indeed! Where is Mr. Turner's authority for this statement? We fancy that the youngest historical student in the Public Library, whose 'utility' he appears to hold in contempt, would rightly inform him, if he does not already know it, that the ever-to-be-deplored sweeping-away of Evesham Abbey was not done in the smallest degree in the spirit of utilitarianism. It was the outcome of a political and religious revolution . . . Utilitarianism would have built something on the ruins, but these remain untouched even to this day . . .



"His committee,' Mr. Turner says, 'regrets to notice' the removal of 'a good piece of old domestic architecture on the left of the passage leading to the Square.' This refers, of course, to the removal of the old bookseller's shop and adjacent buildings and the erection thereon of the new group known as the 'Journal Buildings.' The expression of 'regret' in such a connection is really grotesque. We doubt if a single member of the committee ever saw the 'good piece of old domestic architecture referred to, or if he did he could not have noticed its construction or its surroundings. It was in its frontage to the 'Square' a lath and plaster erection built at the end of the seventeenth century, a modern brick front with a parapet having been run up at the Bridge Street side to keep it up. Behind there was a conglomeration of offices, and adjoining it were, in the Market Place, two brick-built houses and in Bridge Street an offensive butcher's shop! Where the 'good architecture' was to be found is undiscoverable by anybody except Mr. Thackeray Turner and his committee. Perhaps it was in the bulging windows over the footway which had been so constructed because there was no other way of getting light and air. The (relatively) old buildings had no redeeming feature. For business they were inconvenient; for residence unhealthy. To weep over their replacement by the present group of handsome, convenient and healthy buildings is to shed crocodile's tears."

York House, Twickenham, is to be sold by auction.

A Fire at the Soane Museum in Lincoln's Inn Fields occurred on Saturday night, the fire having originated in a bedroom on the top floor, which set the roof ablaze. No damage, however, was done to the collection.

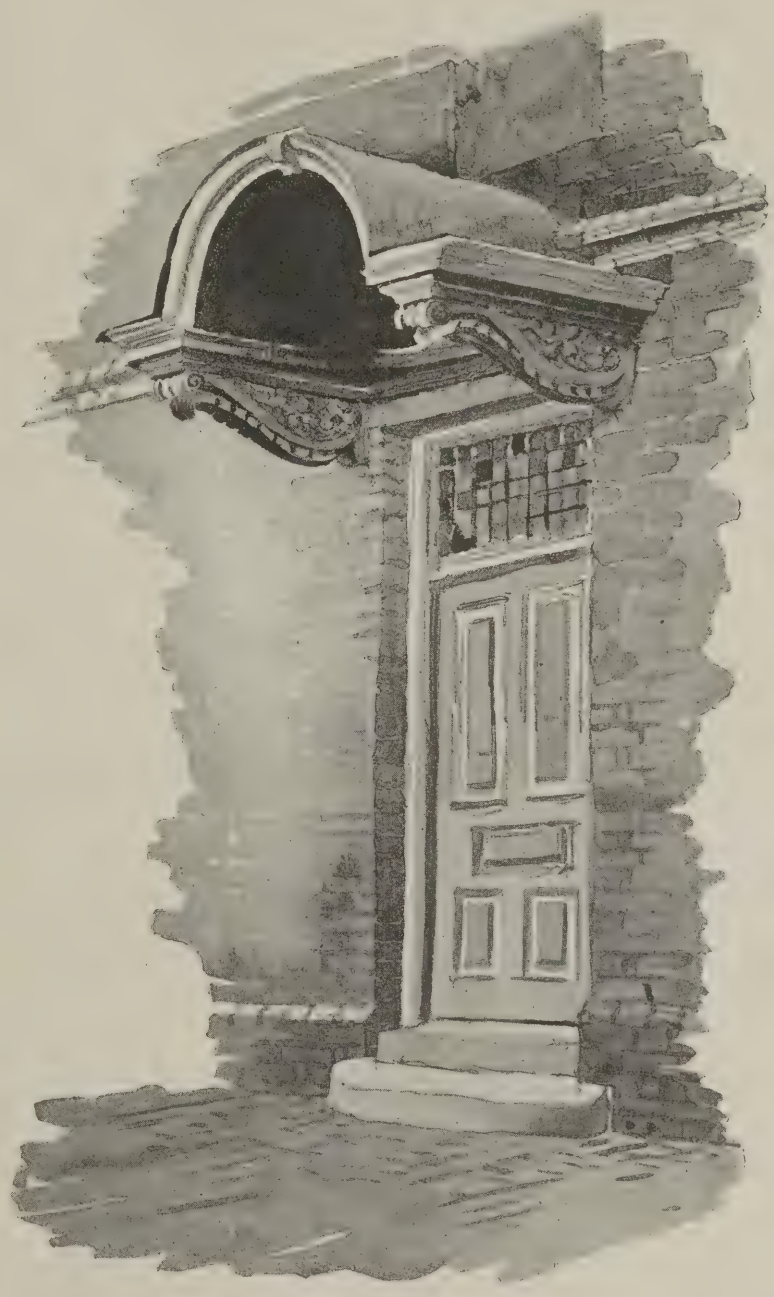
The Rossetti Window in Birchington Parish Church was badly damaged on Friday night last by thieves, who stole the collection boxes. The tomb of Rossetti in the church was designed by Ford Madox Brown.

The R.I.B.A. Autumn Examinations will take place as follows:—*Preliminary*, November 4th and 5th (applications to be sent in on or before October 11th); *Intermediate*, November 4th, 5th, 6th and 7th (applications as before); *Final and Special*, November 14th to 21st (applications by October 25th); examinations qualifying for the *Office of District Surveyor in London*, October 23rd and 24th (applications by October 9th).

A PORCH AT BEWDLEY. DRAWN BY JOHN HUTCHINGS, A.R.I.B.A.

Views and Reviews.

Practical Joinery.



This book is the best on practical joinery which we have seen. Mr. Ellis, an old contributor to our columns, has excellent qualifications for undertaking such a task. His long experience as an instructor in joinery at the Trades Training Schools of the Worshipful Company of Carpenters fits him to explain, readily and simply, the principles of joinery. His phraseology is very clear throughout, and his whole treatment of the subject is modern. The methods of construction described are those generally adopted by skilful workmen, and are such as are in constant use in the best London workshops at the present time, and although handwork has been given the primary place the more important variations required for machine production have been dealt with. The book begins with a description of hand tools and workshop appliances, and then proceeds, with the help of some very clear diagrams, to explain workshop practice. Here is introduced a novelty in the shape of photographs of a joiner actually performing the different operations. This is an excellent idea, and shows at a glance what no lengthy description could do. The author then proceeds to deal in special chapters with joints; doors and gates; door framings, linings and finishings; windows and fittings; shutters, blinds and finishings; shop fronts and shop fittings; air-tight case work; fittings for banks, museums, libraries and churches; shaped, curved and bevelled work; miscellaneous fittings; stairbuilding; handrailing; mouldings; foremen's work; fixing joiner's work; notes on timber; description of woods used in joinery; and a glossary of technical terms and phrases connected with joinery. When it is said that all of these are dealt with comprehensively, many for the first time being properly treated, it will be realised how important a publication Mr. Ellis's book is. It will undoubtedly become a standard work on joinery. The author treats the subject, as it can only properly be treated, by proceeding from elementary principles to their application in everyday practice. The book is very well illustrated with a large number of scale and isometric drawings, and these in themselves should be of great service to architectural students who are naturally not in constant touch with the executed examples. It must of course be expected that Mr. Ellis has given the best methods of work, but the architect must be warned against a slavish following of his details as necessary to efficiency, for in practical work many of the safeguards he employs are omitted for the sake of economy of labour, the most important item in the cost of joinery. For instance, where Mr. Ellis is careful, as a good joiner would be, to avoid the use of nails wherever glued joints are stronger—there are far more nails used for the sake of saving labour than might be supposed. This is especially noticeable in the details of window frames and sashes. Then again the finish of actual work is never so fine throughout as the illustrations show, nor is it often necessary that it should be. In some cases too-accurately fitted work is apt to be more harmful than good, such as in constructing weatherproof casements (as shown on p. 136 in the book), where in the case of continued wet the wood would swell and prevent the opening or closing of the window. A rough joiner would probably be called in to ease the joints, with the consequence that it would not keep out the wet which it was intended to. We do not notice anything with regard to the details of window frames built flush with the exterior face of the wall, nor do we know of any book which gives such details. The publisher is to be complimented for publishing such a book in so admirable a manner. We look forward to Mr. Ellis's promised work on Carpentry.

"Modern Practical Joinery," by George Ellis. London: B. T. Batsford, 94, High Holborn, W.C. Price 12s. 6d. nett.

Liverpool Building By-laws.

The second edition of this most useful aid-book to the Building Regulations in force at Liverpool, arranged and annotated by Mr. Goldshaw, city building surveyor, with diagrams by Mr. James Dod, architect, has just been published, revised and enlarged. A similar book would be of the greatest service in London, and we are surprised that nothing has been done to supply the need. This handbook is intended for the use of architects and builders, and does not give the actual wording of the Acts of Parliament and the by-laws from which it is compiled, nor does it include purely legal clauses. The interpretations of any clause that has been decided in any law case are carefully noted. The wording of the clauses is most clearly done and arranged in excellent order. There is a very comprehensive index. The work is divided into two volumes, the second consisting of diagrams (many in colours) illustrating the application of the regulations. This is, perhaps, the most useful part of the work, though, of course, the first is of great importance and use also. An immense amount of time, labour and worry is avoided by this second volume, which shows at a glance the interpretation of any clause in the regulations. On the diagrams note is also made of the governing conditions and exceptions, &c., so that it is not necessary to wade through the regulations to see if any others apply to the case in hand or whether it is an exception to one or other.

"The Manual of the Building Regulations in force in the City of Liverpool," arranged and annotated by William Goldshaw, City Building Surveyor, with diagrams by James Dod. Liverpool: C. Tinling & Co. 53, Victoria Street. Price 7s. 6d.

DOOR AT NEWCASTLE (STAFFS). DRAWN BY JOHN HUTCHINGS, A.R.I.B.A.

Cisterns and Tanks.

Prof. Henry Adams has just published Part III. of his series of books on "Designing Ironwork." This part contains notes upon cisterns and tanks in general, together with detail drawings and calculations for a cast-

iron tank to hold 15,000 gals. This series of books is very clearly written and the present one is a welcome addition. It contains notes on materials used in the construction of cisterns and tanks, and the author then proceeds to discuss the formulæ for the calculation of the constructive details. He next deals with the form and details of tanks and the method of construction. Particulars of large tanks which have failed form a very interesting part of the book. Notes are also included on the preservation of tanks and pipes. The illustrations are very clearly drawn.

"Designing Ironwork: Part III., Cisterns and Tanks," by Henry Adams, M.I.C.E., M.I.M.E., F.S.I., Professor of Engineering at the City of London College. Price 2s. Published by the author at 69, Victoria Street, E.C.

LIVERPOOL CATHEDRAL COMPETITION.

The Advisory Architects' Report.

THE following is the report of Mr. G. F. Bodley, R.A., and Mr. R. Norman Shaw, R.A., advisory architects, on the designs submitted in the preliminary competition for the proposed cathedral at Liverpool:—

Of the great importance of ensuring a fine design for the proposed cathedral there can be no question. Truro alone in England has had a new cathedral, the first built for many generations. Truro is but a county town, while Liverpool is one of the largest and most important of our cities.

The new cathedral must be a stately, a dignified and a beautiful building. It must be suitable for the services of the English Church, and be capable of holding large congregations. All this is obvious.

The Committee having determined on a competition, it is our duty to select the best designs submitted in this preliminary competition, and then to invite their authors to compete for the great work, in accordance with the regulations that may be laid down for their guidance.

What seems to be necessary is a design having a distinctive character of its own, and one not without originality. A design with a striking unity of effect and idea.

Gothic Pre-eminent.

We were prepared to find more designs of a Renaissance or a Classical manner. We were surprised to find so few in those styles, and those, we feel bound to say, not commanding nor remarkable. The main body of the best designs sent in are Gothic. This seemed to point to Gothic as the style from which we should find it practical to select. And, indeed, that manner is accepted by most as generally the suitable one, except under special circumstances, for church-building. In making a selection there seemed no doubt but that our own English phase of the style should be adhered to.

Mediæval Cathedral Plans.

Many of the designs sent in have plans more or less like numerous fine mediæval cathedrals, with many chapels clustering round the eastern end of the choir. It is no doubt an arrangement of much beauty. One or two such chapels may be desirable, as being very useful in bringing comparatively small congregations together for early or evening services, but many such chapels would not seem to be appropriate for the uses of the English Church. There should certainly be one or two such chapels, but we suppose not more would be needed. Modifications of many of the plans submitted would therefore seem to be necessary. How far what we have said on this point should be embodied in the instructions to be given for the final competition we leave to the consideration of the Committee.

We feel that the object of the competition is to enable the Committee to find out the best man for the work. What he submits may be thoroughly examined and discussed, and, if it seems desirable, may be modified or improved on.

The opportunity, the great opportunity, must not be lost for the erection of a really stately and a beautiful building, one of striking proportions and of delightful detail. Our old ecclesiastical buildings afford many such examples. Not, indeed, that they should be copied, for Liverpool Cathedral must be an original work of art and have a character of its own—one fitted for the requirements of the present age, and one specially designed for its site. The spirit of our best architecture may, however, well be caught, and its magnificent traditions may be recovered and handed on.

Whatever style is adopted there should be that nobility of expression, and that refinement of feeling, that is so characteristic of all the best architecture of the great times. We may add that a noble simplicity, enhanced by touches of beauty, is not a thing to be afraid of.

In judging the designs one must take care to discern the real effect that the building would have, and not to be led away by any clever delineation of a conception that may not be really good. This is evident, but a first impression given by a clever and beautiful drawing, even though it be of a poor design, may be misleading and deceptive.

We shall look forward with interest and pleasure to the work of reporting to the Committee on the designs to be sent in for the selection of one that may be not unworthy of your important and great city of Liverpool.

There has happily been some revival of taste and knowledge of architecture in recent years, and this new cathedral should show a dawning sign of that improving state of feeling, and mark the period as one of greater advance towards the beauty and the dignity that characterized the great days of art; and above all, it should be an example of cultured and religious feeling in church-building.

The Portfolios.

With regard to the plans submitted we beg to report that we have examined the various portfolios of designs, and all the drawings that were hung on the walls, with great care and with the deepest interest. The number in all is 103: of these thirty-three are designs prepared expressly for this competition. They represent much labour, and we may also say a considerable amount of talent. Twenty-three are sent as evidence of skill and ability to design a cathedral, and consist mainly of designs which have been submitted mostly in competition for large churches in different parts of the world.

The remainder are a miscellaneous collection of photographs, drawings and sketches partly ecclesiastical and partly secular. Though many of them are of much excellence, they do not show any evidence that their authors have any special claim to be considered aspirants for the work of building a cathedral. It is vain to shut one's eyes to the fact that many of the competitors in the last class have taken absolutely no trouble. They have simply sent in a portfolio containing few, or many, photographs or drawings which they happened to have by them; whereas in the cases to which we first referred, where special designs have been prepared, the competitors have, many of them, taken great care and trouble, and have done their best to respond to the invitation of the Committee.

From the plans sent in we have selected five that we consider show their designers to be capable men. They give evidence of considerable knowledge of old work, great care in design, and originality of a sound and practical nature. Not the originality which has little aim beyond being eccentric for the sake of being considered original, but which does not regard beauty and fitness as necessary.

These five we suggest should be asked to prepare complete designs for the cathedral, in accordance with the conditions to be laid down by the Committee.

This seems a small number to name out of such a long list of competitors, but, on the other hand, it may lead to greater effort being made to conceive and delineate a fine design and with greater hope on the part of the designer of success, and, for the world, for an ultimate and satisfactory result. These designs are numbered 20, 45A, 68, 71, 95.

In addition to the above we consider it would be a gracious act, and one that would be appreciated, to nominate a certain number for honourable mention, as a distinct recognition of considerable skill shown sometimes in planning and sometimes in design, though we were unable to award them a still more honourable place. We selected eight—namely, Nos. 17, 37, 41, 44, 45, 46, 84 and 94—for such honourable mention.

The five architects referred to in the report are:—

20. Austin and Paley (Lancaster).
45A. C. A. Nicholson (London, W.C.).
68. G. Gilbert Scott (London, S.W.).
71. Malcolm Stark (Westminster).
95. W. J. Tapper (London, W.C.).

Those honourably mentioned are:—

17. Sir Thomas Drew (Dublin).
37. J. Oldrid Scott (Westminster).
41. A. H. Skipworth (London, W.C.).
44. H. C. Corlette (London, W.C.).
45. C. A. Nicholson (London, W.C.)
46. F. Walley (Chester).
84. James H. Cook (Liverpool).
94. Reilly & Peach (London, S.W.)

The foregoing report has been adopted by the Executive Committee.

Some Facts.

In the report of this Committee to the General Committee the following facts are mentioned:—The Bill passed through both Houses of Parliament and received the Royal Assent on August 8th, and, according to agreement, the purchase-money of the St. James's Mount site (£10,000 in addition to £1,300 for the reversionary interest in the several leases of the dwelling-houses on the ground) is payable to the Liverpool Corporation on February 8th next. The Executive Committee have reserved to themselves the right of inviting any architect or architects to submit designs and plans in the final competition: each architect taking part in such competition to receive an honorarium of 300 guineas. The advisory architects are to receive an honorarium of 500 guineas each. Towards carrying out the scheme the sum of £154,114 has been promised, of which £71,646 has been received and £60,543 invested.

The Abbey of Hautecombe (illustrated on the opposite page) is situated in the Haute Savoie, in the Burgundian district of France, twenty-two miles south of Geneva. The building, of late Flamboyant Gothic, is unique in character. It was once as elaborate in its external design as the church of Brou, in the suburb of Bourg-en-Bresse; but even now in its rebuilt condition it is attractive and full of interest.

The New Workshops for the Fechney Industrial School at Perth are being erected at a cost of about £2,000. Mr. David Smart is the architect. The contractors are:—Masonwork, Alexander Beveridge; joinerwork, Thomas Forgan & Son; slaterwork, James Buchan & Son; plasterer, John Peebles & Son; plumber, James MacLeish; ironwork, Messrs. Robertson & Robertson, Perth Foundry.

SMALL-POX HOSPITALS.

Government Circular.

ON Thursday last the Local Government Board issued a circular respecting small-pox to town councils and urban and rural councils throughout the country. In it the following appears:—

Looking to the extreme importance of the immediate isolation of small-pox cases, the Board would urge upon the council that, if they have not already done so, either alone or in conjunction with other councils, they should without delay make arrangements for obtaining suitable hospital accommodation for any cases that may occur in their district. In view of the liability of small-pox to spread around hospitals in which patients suffering from that disease are collected, such hospitals should be placed in sparsely-populated situations. The Board require, as regards hospitals for small-pox, the cost of which is defrayed out of borrowed money, that particular conditions should be complied with, and it is important that the like conditions should be observed in respect of such hospitals when the cost is defrayed out of current rates. These conditions, which are set out in the Departmental Memorandum "On the Provision of Isolation Hospital Accommodation by Local Authorities" are briefly as follows:—

1. The site must not have within a quarter of a mile of it either a hospital, whether for infectious diseases or not, or a workhouse, asylum or any similar establishment, or a population of as many as 200 persons.

2. The site must not have within half a mile of it a population of as many as 600 persons, whether in one or more establishments or in dwelling-houses.

3. Even where the above conditions are fulfilled, a hospital must not be used at one and the same time for the reception of cases of small-pox and of any other class of disease.

Looking to the difficulty frequently met with in obtaining a suitable site for a small-pox hospital, and also to the circumstances that small-pox patients commonly bear removal well, while their removal is more readily consented to than that of patients suffering from other infectious diseases, a small-pox hospital may conveniently serve a larger area than an isolation hospital for other infectious diseases. There is, therefore, often advantage in a combination between districts for the purpose of providing small-pox hospital accommodation. Where no hospital suitable for receiving cases of small-pox exists, it may be necessary to make temporary provision for the reception of such cases, *e.g.*, by acquiring possession of an existing house having sufficient land on which huts or tents for patients may be erected. The provision of hospital accommodation, however, should not be deferred until small-pox has actually occurred, or dangerous delay may be involved in securing a suitable site or premises.

Other requirements in connection with any hospital (*e.g.*, ambulance, nursing staff and medical attendance, water-supply and sewage-disposal) should also be considered beforehand.

NORTHERN A.A.

THE members of the Northern Architectural Association recently paid a visit of inspection to some large new buildings at Newcastle-on-Tyne. They first inspected the Cathedral Buildings near the top of Dean Street (Messrs. Oliver, Leeson & Wood, of Newcastle, architects). The buildings comprise five storeys, exclusive of the ground floor and basement. The exterior is of red brick, with a green slate roof, and oriel windows of carved oak having panels modelled in terra-cotta, whilst the skyline is broken up into gables. The upper part of the buildings is relieved by being covered with rough-cast, and at the fourth floor a projecting balcony has been formed the full length of the building to give easy access to the roof. The iron columns on the ground floor are exposed instead of being concealed by mirrors or other devices. The contractor was Mr. Stephen Easten; Messrs. Richardson carried out the painting work, Messrs. Bland the electrical work, and Messrs. Walker and Coxon the plumbing.

The palatial building in Collingwood Street, built for the Sheriff of Newcastle (Mr. W. J. Sanderson), was next inspected. Messrs. Oliver, Leeson & Wood were also the architects for this building. Excluding the ground floor and basement, there are five storeys, and from the top a fine bird's-eye view can be gained southward and also partly to the west. The ground and first floors are treated together as a continuous arcade, formed by granite piers carrying

THE ABBEY OF HAUTECOMBE HAUTE SAVOIE, FRANCE.

arches having the soffits in panels, with carved rosettes. The plan of the building is a central octagonal hall, from which the corridors diverge to the east and west on every floor. There is a staircase with marble steps and newels, and a wrought-iron balustrade to the top of the building. At either side of the octagonal hall are passenger lifts. The corridors and octagonal hall are laid with ceramic mosaic, and advantage has been taken of the octagonal form to produce an architectural effect with monolithic marble columns. This entrance hall is carried up to the first floor and finished with a dome of enriched plasterwork. The entire western portion of the building has been acquired by Messrs. Barclay & Co., bankers. There are eighty-nine offices, and it is understood that the premises will be ready for occupation next month. The contractor is Mr. Alexander Pringle; the marble and mosaic work has been carried out by Messrs. Emley & Sons, of Newcastle, and the plastering by the Fibrous Plastering Co., of London.

Builders' Notes.

The Value of the New Buildings in Glasgow sanctioned during the past year amounted to £2,549,698.

Failures in the Building and Timber Trades during the week ending September 27th last were six, as compared with seven during the corresponding week of 1901 and fifteen in 1900.

Partnership Dissolved.—The partnership lately subsisting between Messrs. Herbert Matthers, Wybrants Olphert, and Samuel Lewis Jones, formerly carrying on business as colliery proprietors and brick manufacturers, at Resolven, near Neath, Glamorgan, under the style or firm of Gored Merthyr Colliery and Melincourt Brickworks, has been dissolved by mutual consent. All debts due to or owing by the said late firm will be received and paid by Mr. Samuel Lewis Jones, who will continue the business in his own name.

Ontario Timber Exports Prohibition.—An Order in Council was recently passed by the Ontario Government prohibiting the exportation of hemlock logs after April 30th next. Pine is also prohibited. Of late years a considerable trade has sprung up, owing to the increasing value of these classes of timber.

A Co-operative Building Firm.—A company has been formed and registered under the title of the Amalgamated Builders, Ltd., by the Amalgamated Society of Carpenters and Joiners, which has a membership of 70,000. The members have adopted their general council's proposal to take over and develop the joinery works established at Hull, Blackpool and Bradford, and have decided that the 2s. levy agreed upon in October last should be applied in furtherance of the scheme in other suitable districts. It is stated that the new company will compete with private firms for work in the areas covered.

The Dewsbury Crane Disaster.—Mr. P. P. Maitland, county coroner, last week held an inquest on the bodies of three of the men killed on Thursday week by the collapsing of a crane at the Soothill Quarry, owned and worked by Messrs. James R. Akeroyd & Sons. Mr. W. H. Pickering, H M. Chief Inspector of Mines and Quarries for Yorkshire and Lincolnshire, said the crane appeared to have been well adapted for the work designed, and in his opinion the cause of the accident was the collapse of the pillar on which the footstone was resting. The mortar contained sufficient lime, but either the lime was not freshly slaked or properly mixed, or the stone had recently been fixed, for the mortar had not set and had not adhered to the stone. When mortar is in such a condition it is more of the nature of a lubricant than a binder. Mr. R. Akeroyd, managing director of the firm, stated that the mortar used at the quarries was composed of South Elmsall lime and river-sand. Instructions were always given to mix the mortar in the proportion of a ton of lime and three of sand. He could not account for the difference in the samples of mortar produced. The jury returned a verdict that the men met their death accidently from the collapse of a crane, in the fixing of which improper mortar had been used.

Fire Protection in London Theatres.—After their first meeting last week the newly-formed Association of London Theatre Managers issued a communication to the Press in which they asked for finality of decision in regard to fire-prevention in their theatres. "Failing this, they would feel themselves justified in appealing for the creation of a permanent Government Department attached either to the Lord Chamberlain's Office or to the Home Office. The managers have already expressed their willingness to defray the cost of such a department out of their own pockets by a system of taxation. They feel certain that such a permanent department, assisted by experts, would secure a continuity and uniformity of administration which, from the nature of the prevailing system, is scarcely to be expected. The managers refer to the report from the Select Committee on Theatres and Places of Entertainment, printed by order of the House of Commons on June 2nd, 1902. Clause 4 says: 'Referring to those resolutions of the Council passed on the 5th of April, 1892, wherein it is suggested that in certain cases (therein specified) where certificates of safety have been granted, periods of grace of seven years, ten years and five years respectively should be allowed to the owners of theatres and music-halls during which no further requirements for structural alterations should be made, we desire to express our agreement in the principle that when owners or lessees have fairly fulfilled obligations imposed upon them in these respects they ought to have all reasonable safeguards against unnecessary interference.'"

Surveying & Sanitation.

The Royal Institute of Public Health has accepted the invitation of the Lord Mayor of Liverpool to hold its annual congress in that city next year. In all probability the meeting will take place about the third week in July. Lord Derby has accepted the position of president at the Congress.

New Park for Manchester.—The Lord Mayor of Manchester last week formally opened Heaton Park for the use of the general public. The park, which is situated within three miles of Manchester, contains nearly seven hundred acres, and was purchased by the Corporation recently from Lord Wilton for the sum of £230,000.

Insanitary Areas in Leeds.—The work of demolishing the insanitary areas of Leeds continues. The Sanitary Committee of the Corporation recommends the City Council to accept the tender of Messrs. Isaac Gould, Ltd., for the construction of an underground subway in York Street and Marsh Lane for the sum of £3,307 8s. This is in connection with the York Street scheme. It is also proposed to purchase further properties in the Quarry Hill district with a view to clearing away unhealthy areas there.

Engineering Notes.

A Roman Smelting Works Discovered.—The workmen employed on a deep drainage scheme at Stamford have come across the site of a Roman iron smelting works.

A New Pumping Station for Portsmouth Dockyard is to be erected to fill and empty the docks used for destroyers. The contract for the building has been placed with the Westminster Construction Company.

The Society of Engineers paid a visit on Wednesday, September 24th, to the engineering works of Joseph Baker & Sons, Ltd., and the machine works of the Wicks Rotary Type-casting Co., both of which establishments are situated in Hythe Road, Willesden Junction.

London Bridge Widening.—On Saturday last the workmen placed in position the east girder used in the construction of the temporary footbridge on the north-west side of London bridge. Six weeks, however, will elapse before this temporary bridge is opened for traffic. The construction of the bridge on the east side has been commenced, and when the two are completed all pedestrians must pass over them for the next two years. The huge iron girders which have been placed in position weigh over 800 tons, and the cost of constructing these temporary bridges will be £30,000.

The Tees Iron Industry.—A working agreement between the firms of Dorman, Long & Co., Ltd., and Bell Brothers, Ltd., both of Middlesbrough, is shortly to be made, and a special meeting of the shareholders of the former has been called to consider the matter. Sir Lowthian Bell will become chairman of Dorman, Long & Co., and three of the directors of Bell Brothers are to join the board, Mr. Dorman taking the position of vice-chairman and managing director. The capital of Dorman, Long & Co. when this operation is completed will be £1,ccc,coo. The two firms concerned are the largest iron and steel manufacturers of the North.

The Smaithwaite and Smithy Bridges near Thirlspot, on the much-frequented coach road between Keswick and Grasmere, have been recently respectively rebuilt and widened. The new bridge at Smaithwaite is practically in a direct line with the roads on both sides of the gill, and is of such height as to make the road almost level between the hills on the opposite banks. The road between the two parapets is 22ft. 6in. wide, compared with a 13ft. road on the old bridge; and the parapets are 3ft. 6in. above the level of the road-surface. The new bridge has a span of 50ft. The rise of the arch at the crown is 12·5ft., and the thickness of the abutments is 10ft. It is placed on the east side of the old bridge (which still remains). The work is sneck or broken faced. The arch is massive and in keeping with the dam of the Manchester Corporation Waterworks, which impounds the water of Thirlmere close by. A little further along the road in the direction of Grasmere another improvement has been effected in the lowering of the crown of the Smithy Brow and the widening of the Smithy Bridge (which crosses the How Beck) by the addition of a skew extension to the west or high side of the old bridge. The span here is 20ft.; the angle is 40 degs. and the oblique span 31·114ft. The hill between Smaithwaite and Smithy Bridge has been lowered 6ft. and the gradient over Smithy Bridge is now 1 in 19 throughout. The stone used at both bridges is the Aspatria red freestone, and the total contract price for the two bridges has been £2,036—£704 for the Smithy Bridge and £1,332 for Smaithwaite. Mr. Telfer, of Langholm, was the contractor; Mr. Bell, the county surveyor and bridge-master, was the engineer.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Preserving an Old Oak Chimney-piece.

BIRMINGHAM.—BRUM writes: "Which is the best way to preserve a valuable old oak chimney-piece which is decaying badly and is full of insects?"

The querist might have been more explicit in indicating the probable nature of the "decay" referred to. "Insects," too, is rather a vague term, but surmising that the trouble is of that order when wood is said to be "worm-eaten," little hope can be held out of any treatment proving really effectual in ending the trouble. The rottenness of worm-eaten wood is due to the persistent boring or tunnelling of some insect—variously termed louse, weevil, &c.—or, more probably, the larva (worm or maggot) of some insect of whose life-history little or nothing seems to be known. It has been stated to be the larva of a small brown beetle, about $\frac{1}{8}$in. long, which arrives at maturity in the month of July; but the insects usually seen about wood that is worm-eaten are very agile louse-like creatures. Whether these are the cause of the borings or merely tenants of the tunnellings, the writer cannot say; they seem, on a cursory examination, to be akin to the insects which infest old books (book-worms?). Various treatments are recommended as palliatives Impregnating the affected parts with benzoline, benzine or paraffin, though useful, has self-evident disadvantages; oil of cassia is said to be effective; some use a decoction of bitter apple in water; a more drastic though tedious remedy is to inject in each hole, using a hypodermic syringe, a solution of bichloride of mercury (corrosive sublimate) made by dissolving 1oz. of the salt in a pint of water. Another recipe for the solution is mercuric chloride ($\frac{1}{4}$oz.) dissolved in water (20zs.) and methylated spirit (20zs). Both these mixtures are rank poison, and should be used with extreme care. H. E.

Municipal and Sanitary Engineers.

LIVERPOOL.—DOMINO writes: "Where can I get a prospectus of the examinations for municipal and sanitary surveyors?"

Apply to the secretary of the Incorporated Association of Municipal and County Engineers, 11, Victoria Street, Westminster, S.W.

Value of Land in London.

HARROW.—A. B. writes: "What is the value of land in Piccadilly near or facing Green Park? Is there a record kept of sales in London?"

The value of land in Piccadilly would depend almost entirely upon its extent, shape and position, and it would be most misleading to suggest any sum without having this information. A record of sales in London is kept by the "Estates Exchange," whose offices are at the Auction Mart, Token-house Yard, E.C. The information they supply, however, is confined to members, who pay an annual subscription towards the cost of keeping up the record.

HAMPTON & SONS.

Copper-Covered Spires.

MANCHESTER.—E. W. writes: "In covering a spire with copper which I wish to develop green, is it necessary to use any special copper? I have been told that the modern copper has had some property extracted which often prevents it becoming green. I should like to know if this is true, or whether it is only the question of the state of the local atmosphere which is the determining factor."

Of course the alloy in the copper has some very slight effect on the tint of green which the copper acquires, but the question of it going green entirely depends upon the atmospheric conditions.

Evening Classes in Building Construction in London.

LONDON, W.—SMITH writes: "Which is the best evening school in London for building construction (honours stage)?"

There are a number of schools which have good classes in building construction. We might suggest that you go to the Polytechnic in Regent Street, W.

Pocket-Book of Building Memoranda.

NANTWICH.—J. F. H. writes: "Is there any pocket volume giving general information suitable for a builder, and embracing the building trade throughout?"

Get Hurst's "Architectural Surveyor's Handbook," published by E. & F. N. Spon. Ltd., price 4s. nett.

Indices to the "Builders' Journal."

DURHAM.—A. M. D. writes: "Please state with which number of your journal the volume before the last one begins; also one or two volumes before this. I want the numbers containing the indices"

The index to Vol. XIV. appeared in our issue for February 19th, 1902; for Vol. XIII. in August 28th, 1901; for Vol. XII. in February 13th, 1901; for Vol. XI. in August 8th, 1900; and for Vol. X. in February 7th, 1900.

Sketching around Liverpool.

AINTREE.—DRAUGHTSMAN writes: "Kindly give me some information about architectural work to sketch in the Liverpool district, particularly the country lying around Sefton and between Liverpool and Ormskirk."

Sefton has a fine church of the time of Henry VIII., containing monuments and brasses and good carving. Ormskirk has a church with detached tower and spire, said to have been erected to the memory of Edward, third Earl of Derby, in 1572. Allerton contains Allerton Hall, which is partly old and partly new. There are several old manors in the villages near Liverpool, of which the most ancient and curious is Speke Hall, built mostly in timber and plaster, and which, when entire, enclosed a square area or court. It was formerly surrounded with a moat. Little Moreton Hall (described and illustrated in the BUILDERS' JOURNAL for January 8th last) is of the same character, and extremely beautiful, while Prestbury Church and Vicarage are both worthy of a visit, but they scarcely lie in the district mentioned in the question. G. A. T. M.

Reciprocal Diagrams.

PROBATIONER writes: "The following question was given at an Intermediate Examination of the R.I.B.A.: 'What do you understand by the term reciprocal diagram? Give the reciprocal diagram to an ordinary king-post roof-truss. What is the object of a reciprocal diagram? Illustrate this part of the answer by reference to the king-post roof-truss and its reciprocal.' Kindly answer this."

The reciprocal diagram is the stress diagram, the method of obtaining which was explained at length in the articles on "Building Construction" in our issues for October 30th and November 6th, 1901.

Surveying Expeditions.

HALTWHISTLE.—E. H. writes: "How could I obtain a position in a surveying expedition abroad, and what are the qualifications necessary for such a post?"

Surveying parties of this description are generally made up privately, but occasionally vacancies are advertised in the principal engineering papers. The chief qualifications necessary are sound physique and a thorough practical knowledge of land surveying in all its branches, while experience in dealing with native races is also extremely valuable. G. A. T. M.

Book on Glass-making.

GLASS writes: "Is there any book giving a description of furnaces, &c., as used in the manufacture of glass?"

"The Principles of Glass-making," by H. J. Powell (George Bell & Sons), will probably serve your purpose.

Domes.

LONDON, N.E.—J. W. F. writes: "Are the beds of the courses of stonework in the pendentives of a dome level or do they radiate from a centre, like those of the dome proper?"

The joints radiate from a centre the same as in a dome.

Architectural Study.

W. W. writes: "I am in an architect's office. The only evening school I can attend does not hold classes in architecture until the fourth year of a building course, and then not of much worth. What books on architecture should I study? I have a copy of Mr. Phenè Spiers's 'Orders.'"

You cannot study architecture properly until you have a knowledge of building construction. Read Banister Fletcher's "History of Architecture," measure and study old buildings, and also go over and study recent developments in design.

Plenum System of Ventilation.

SHREWSBURY.—G. D. L. writes: "Kindly give full particulars of the 'plenum' system of ventilation, or inform me where I can procure such."

See Specification No. 5, and F. Dye's "Warming and Ventilating Buildings" (E. & F. N Spon, Ltd., price 10s. 6d. nett).

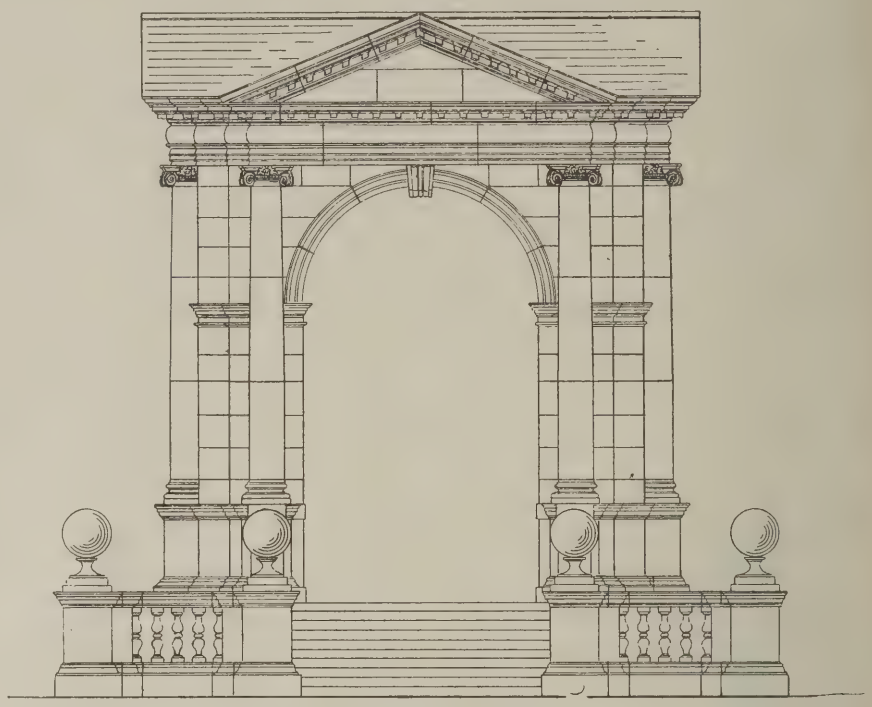
Chancel and Nave Roofs.

WINTON writes: "Should the roof of a chancel be higher or lower than the nave roof? Did this apply to churches in the Middle Ages?"

The line of roof throughout is, in my opinion, better unbroken—this is almost invariably so in large churches belonging to the Religious Houses, the difference in height being marked only by the rise and steps from the body or nave to the chancel and from the chancel to the sacrarium. Some designers prefer to denote a difference by placing a cross or flèche over the point of separation between the chancel and the nave. The difference in the height of the roofs is mostly found in country districts, and came about through the narrowing of the chancel and the adoption, as a consequence, of the chancel arch, the narrowing of the chancel necessitating (if the same pitch was kept) the lowering of the roof. In the Middle Ages one finds all varieties in use. There are authorities who state that wherever churches exist with the roof of the chancel higher than that of the nave, these churches belonged to the Dominican order. Again there are others who say that the nave and its roof, where lower, was usually of later date, and this explanation certainly would account for the difference, as the Perpendicular work was less in pitch than the earlier styles. Finally, some authorities give as a reason that when the chancel was higher than the nave in buildings belonging to the Regular Clergy, it was to show that the faithful laity used the nave on sufferance only and were subservient to their masters, the Elect.

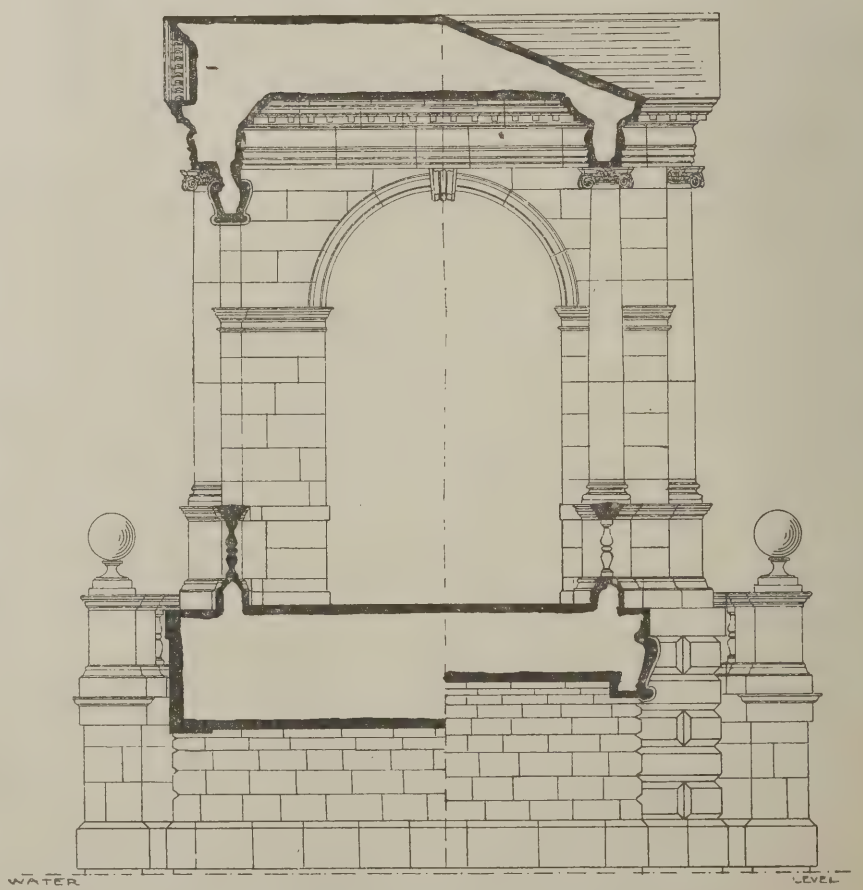
A. H. R.-T.

Bricks and Mortar.



Aphorism for the Week.

Architecture differs from her sister arts of painting and sculpture in this, that while they directly originate from a feeling for beauty, and are either wholly independent of utility or only accidentally connected with it, architecture results in the first instance from necessity, beauty being a superadded grace.



SIR GILBERT SCOTT.

Our Plates. THE Palladian Bridge at Prior Park, Bath, situated in one of the prettiest spots in the county of Somerset, spans the first of three small lakes which descend by falls, the first coming in the centre of the bridge, as may be seen on the plan. The bridge is at the bottom of a "comb," lying almost due north and south, the upper slopes being thickly wooded. At the head of the "comb" lies Wood's splendid mansion of Prior Park, built for the famous Ralph Allen between the years 1735 and 1743. Neither the date of the building of the bridge nor the name of the builder is actually known, but among the numerous dates and initials cut into the stones are two—I. D. 1777 and I. T. 1782. The bridge was copied from that at Wilton (1736), and was probably erected between the years 1750 and 1760. Mr. Gilbert E. Peto made the measured drawings which we reproduce, with the assistance of Mr. Mowbray Green, author of "The Eighteenth-century Architecture of Bath."—The restaurant and club in High Street, Stratford, E., is the first of a series intended to be erected by the West Ham Club and Restaurant Co. The company has been formed for the purpose of establishing and conducting in the county borough of West Ham (and elsewhere should it be so determined) club-houses and restaurants, and of providing therein refreshments, sleeping accommodation, amusements and recreation for the industrial classes. Beyond the accommodation shown on the plans there is a basement containing a large coffee- and smoking-room, the kitchens, and the necessary stores and heating-chamber. The work has been carried out at a cost of about £14,000 by Messrs. Kingerlee & Sons, of Oxford, under the superintendence of the architect, Mr. S. B. Russell, A.R.I.B.A., of 11, Gray's Inn Square, W.C.—The design for the groined vault is almost self-explanatory. The plan having been put down and the height of the ridge line settled, it will be noticed that the transverse rib (shown shaded in section) was first drawn with centre on the base line of the springing. From a middle point on the curve a vertical was dropped on to the base line, and at the point where it meets it an arc was drawn with centre at wall line. At the points where this arc cuts the lines of the ribs on plan, verticals were raised to the same height as the vertical dropped from the transverse rib at first. These are points on the curves of the ribs. The other points necessary to find the centres from which to strike the curves of these ribs are of course found by raising verticals from the ends of ribs lines (*i.e.*, where the centres of the bosses are) to the same height as the transverse rib, for the ridge is level. There are three points now determined on every curve, namely, at the ridge, at the springing, and at a point the same height as that taken on the transverse rib. These three points determine the centre to strike the curve from. The wall- and ridge-ribs are drawn independently and the height of the latter determines the curve of the intermediate rib v v, as the vertical from the boss is drawn equal to the height of this boss on the ridge rib x x. The longitudinal section is drawn by means of ordinates from the curves determined on the plan.

The Life of a Bridge. IN a letter to the "Times" in the hope that, "even at the eleventh hour, the erection of a hideous steel lattice girder at Sonning may be prevented," Mr. G. D. Leslie quotes the following remarks by his brother, Sir Bradford Leslie, K.C.I.E., who has been engaged principally on bridge-building for more than forty years (which remarks in the present instance refer only to bridges of moderate span, such as those on the Upper Thames):—"As to bridges, of course, masonry or brick-arched bridges are the best and most economical, because they are practically imperishable. Timber comes next; timber bridges properly designed are as strong as steel. If timber is burnettized with bichloride of zinc under pressure it becomes non-inflammable. Brunel's timber viaducts on the Cornish Railway carried the traffic for forty years, and many of them are still in existence. Timber bridges are half the price

of steel; if the saving be invested at compound interest the accumulated fund would pay for the renewal of the timber from time to time as required, and still show a large economy as compared with steel. I might almost add that timber is safer than steel; a steel pillar or strut is liable to collapse by a blow, especially when under strain, and let down an entire span; timber will give or yield and recover its form. Steel is liable to corrosion in ungetatable places, and the damage may go on until the bridge collapses. This was the case with the Hastings Suspension Bridge at Calcutta."

International Art Exhibition at Venice. The municipality of Venice has opened a competition among Italian and foreign artists for the best design, modelled, for a large gold medal to be awarded to the most important works shown at the International Art Exhibition of 1903. The medal must bear on the obverse an allegorical figure of Venice and her artistic glories, surrounded by the inscription "La Esposizione Internazionale d'Arte della Città di Venezia, 1903," and on the reverse side the words "Gran Premio della Città di Venezia," leaving a blank for the name of the successful competitor, the whole to be surrounded by an ornamental border. Every competitor must send in the models of the obverse and reverse sides of the medal executed in either wax or plaster; the models must have a diameter of exactly 120mm.; and the competitors must send, together with the models, the respective photographic reproductions measuring 40mm. in diameter, which will be the dimensions of the medal. A prize of 3,000 lire will be awarded to the author of the model judged the most deserving of reproduction, and judgment will be given by a commission composed of the mayor of Venice, president of the Exhibition, the general secretary and three artists. The models for competition must reach the office of the secretary of the exhibition (Municipio di Venezia), post-paid, not later than January 31st, 1903, and must be signed with a motto, which motto must also be written on a sealed envelope containing the full name and address of the competitor.

South Kensington Museum. The new buildings of the Victoria and Albert Museum, South Kensington, are progressing rapidly. The walls of the basement are now almost finished, and the eastern side of the quadrangle appears to be complete but for the glazing of the windows. This work has permitted the removal of the obstructions in the route to the refreshment-rooms; and has also enabled the museum authorities to open two small additional rooms to the public in the South Court. These have been filled with English carved woodwork and furniture, in continuation of the series begun by the acquisition of the room from Sizergh Castle. Among the exhibits one does not remember to have seen before are some fine panelling from an old house in Exeter, ascribed to the year 1600, and a splendid specimen of a carved roof-beam, with a quaint inscription running along the whole of its three visible sides, dated 1638.

Brixton Church Tower. The upper portion of the venerable tower of Brixton Church, erected about 1438, has for some years been in a somewhat dangerous state. From the battlements and the beacon tower the entire mortar had been worn away; the louvres of the bell-chamber, which were formed of slate rags, were decayed and very unsafe, and the stones of the tower generally required pointing. Recently, under the superintendence of Mr. Charles King, architect, new louvres of cut Delabole slate have been placed in position, the whole of the battlements have been rebuilt, and a great portion of the walls have been pointed in cement. It is intended, as soon as further funds are forthcoming, to continue the latter renovation to the base. But sufficient has already been done to, at all events, safeguard the ancient tower from immediate injury.

Keystones.

New Harbour Works at Bilbao are being constructed.

A new Sanatorium at Weymouth has been erected at a cost of about £20,000.

Lichfield Grammar School was sold last week for £1,035. The governors will build a new and larger school on a site at Borrowcop.

In "The Best of Friends," the new Drury Lane drama, the furnishing of the scenes in Lord Amsbury's rooms in St. Simon's College, Oxford, and the Great Yeomanry banquet, has been carried out by Messrs. Oetzmann & Co., of Hampstead Road, N.W.

A Statue of Lord Tredegar is to be erected in Tredegar. Mr. Walter Merrett, of 20, Mornington Road, Regent's Park, London, who was a pupil of Mr. Joseph Edwards, Merthyr, and subsequently of the late Sir Edgar Boehm, R.A., is the sculptor commissioned. The statue will be in Sicilian marble.

Cracks in the Doges' Palace, Venice.—On the removal of the bookcases from the hall called the Bessarione, in the palace of the Doges, several longitudinal and transverse cracks were discovered in the inner wall and in the pavement. The condition of the floor is dangerous owing to the volumes of St. Mark's Library weighing heavily upon it. Notwithstanding the official declarations, not a single book has yet been removed from the Doges' Palace.

New Municipal Buildings and Free Library at Dingwall are being erected, Mr. Carnegie having offered £2,000 to build the free library. The chief feature in the existing Municipal Buildings—the quaint old tower—will be preserved, the rest of the building will be taken down, and the new free library block will be erected in connection with the new Municipal Buildings. The front of the latter will face High Street, while the front of the library buildings and the entrance will be on Church Street. The architect of the buildings is Mr. W. C. Joass, Dingwall.

A Discovery of Syrian Rock Sculptures.—Mrs. Ghosn-el-Howie, formerly of Scarborough, Yorkshire, writes from Shweir, Mount Lebanon, announcing her discovery on the eastern slope of Mount Lebanon of two rock sculptures. "The one is a few miles up the mountains, and the other is in a gorge or channel of a winter torrent bordering on the plain of Coele Syria. On the first are seen the figures of a 'bull,' 'cow,' and at least one lion—this combination 'suggests a Hittite origin'; the other is the figure of a female armed with a spear and a sword."

Greencoat Technical Classes.—The technical and art classes held at the Greencoat School, Camberwell Green, S.E., resumed work for the twenty-third session on Monday last. These classes, in affiliation with the Technical Board of the L.C.C., the City and Guilds Institute and the Board of Education, have for many years done good work among the artizan population of Camberwell. Of late their usefulness has been considerably increased by the help of the Technical Education Board's grants in aid of equipment. By this means a very valuable collection of models and apparatus has been provided for the use of students employed in the building trade.

A new Grammar School for Girls at Ashby-de-la-Zouch has been erected at a cost of £10,000. Accommodation is provided for 200 pupils, including thirty-eight boarders.

The Yarmouth Fish Wharf has been extended by the Corporation. Six new offices and ten bays have been added. The new offices are built of glazed bricks. The work cost £1,000.

The New Technical School at Southend has accommodation for 375 scholars and has been built by the town council at a cost of £20,000. The architect was Mr. Henry T. Hare.

A new Courthouse at Sparkhill, Birmingham, has been erected behind the police-station. The work has been carried out by Mr. Frank Davis, of Moseley, under the direction of Mr. A. B. Rowe (acting county surveyor) and Mr. E. T. Fletcher (clerk of works).

New Wesleyan Day and Sunday Schools at Great Lever have been erected at a cost of about £7,000. Accommodation is provided for 850 day-school children and for 1,000 in Sunday school classes. Messrs. W. Townson & Sons were the builders, and Messrs. Potts, Son & Hennings the architects.

A new Congregational Church at Easton, Bristol, has been erected in Greenbank Road. Messrs. George Humphreys & Sons were the builders, and Mr. Frank Wills was the architect. The total cost has been about £5,000. The building is of brick, and, including galleries, will provide seating accommodation for about 800 persons.

A new Grammar School at Beverley has been erected on the west side of Queensgate on a site which stretches westward towards Westwood. The exterior is simply treated in red bricks with stone dressings, and the roofs are covered with red tiles. Mr. John Bilson, F.S.A., of Hull, was the architect, and Mr. J. Constable, of Beverley, the builder.

A Facsimile of the Old Celtic Cross at Treton, in Cumberland, has been erected at Whitechurch Canonicorum, Charmouth, Dorset, as a memorial to the late vicar. It consists of a monolith of Ham Hill stone, 10ft. high, taking the form of a cross at the top. The actual inscriptions upon the shaft are raised upon inlaid slabs of yellow magnesium limestone, identical in colour with the Ham Hill. It is the handiwork of Messrs. Harry Hems & Sons, of Exeter.

A Stone Font, with ornamental oak cover, has been placed in the parish church of St. Thomas as a memorial to the late Rev. W. J. Birkbeck, prebendary of Wells, who was for four years vicar. The font and the steps upon which it stands are all of West-country Beer stone, whilst the spiral cover is of old English oak. They were designed by Mr. Doran Webb, architect, of Salisbury, and carried out by Messrs. Harry Hems & Sons, of Exeter. The hanging apparatus by which the canopy is raised was supplied by Messrs. Singer, of Frome.

A House Stolen.—M. Ridoux, a piano manufacturer of Paris, some years ago built a country house near St. Quinton, in the department of Somme. The house was built of wood on a stonework foundation, and was most sumptuously furnished. For several years M. Ridoux has been in the habit of going there with his family to spend a month during the summer. At the beginning of September, accompanied by his wife and daughters, he arrived at St. Quinton, but found, to his utter astonishment, that nothing was left of the house except the foundations. It appears that during the winter a number of workmen, who said they had been sent from Paris by M. Ridoux, had taken away all the furniture, and afterwards pulled down the house. This they bodily carted away, and sold as old building material.

A new Abattoir at Dublin has been erected in North Circular Road.

A Banner designed by Mr. G. F. Bodley, R.A., and worked by twenty-five ladies, will be exhibited at the forthcoming Church Congress at Northampton.

Change of Address.—Mr. Beresford Pite, F.R.I.B.A., has removed from 48, Harley Street, W., to 2, York Gate, Baker Street, N.W.

A new Institute for Seamen at Salford has been erected in Trafford Road from plans by Mr. J. Medland Taylor. Messrs. W. Southern & Sons were the builders. The cost of the site and the building has been about £6,000.

The Sheffield Society of Artists will hold its annual exhibition of modern works of art in the Cutlers' Hall, Sheffield, from October 14th to November 11th. Sending-in days are October 10th and 11th.

The Roofless Ruins of the Chapel of St. Nicholas, in Carisbrooke Castle, are proposed to be restored as a memorial of King Charles I. The plans have been approved by the Government Department which has the care of historic buildings.

The Following Conversation was overheard at a club:—Layman to rising painter: "I suppose all you have to do is to study at an art school, exhibit at the Academy, and then you are made?" "No; then you go to Paris to be discovered. We don't make anything in England—not even artists!"

At St. Mark's, Hamilton Terrace, St. John's Wood, a memorial window has just been erected to the memory of the late Mr. John Bagnold Burgess, R.A. The appearance of the window suffers from the fact that the gallery runs across it and cuts it in two, but the general colour is rich and harmonious.

The Housing of the Working Classes Committee of the L.C.C. recently considered the report of the architect presenting working drawings, specifications, &c. regarding the blocks of dwellings to be erected in the Clerkenwell Road and Leather Lane frontages of the Reid's Brewery Estate.

St. Stephen, Walbrook.—Messrs. Green & Son, of 28 and 29, St. Swithin's Lane, who have already surveyed and made detailed plans of several parishes in the City, have now been instructed, in accordance with the resolution of the vestry, to prepare a similar plan of the parish of St. Stephen, Walbrook.

An Accident.—A quantity of stone-breaking machinery was recently being moved at Messrs. Goodwin & Barsby's iron foundry at Leicester when the beam of a crane smashed and the whole weight of machinery fell. Five men were injured, having their legs and arms fractured, one man dying a few hours later.

A new Wesleyan Church at Failsworth has been erected from designs by Mr. John Wynne, F.R.I.B.A., of Manchester. The builders were Messrs. A. R. Bullivant & Sons, of Manchester. It is of red bricks, with stone facings in Gothic style, and accommodation is provided for 500 persons. The cost was about £4,000.

A new Font and Two Stained-Glass Windows have recently been added to St. Luke's church, Camberwell. The font was made in Italy from designs by Mr. H. P. Horne, by two brothers, Attilio and Giustino Giustini, of Maiano, a village not far from the famous quarries of Settignano, near Florence. The marbles used are yellow Sienese and red "Cippo," harmonising well with each other and with the black and white marbles of the steps and floor. The bowl of the font is a solid block of red marble, with inlaid yellow marble panels on its eight sides and small columns of the same material at the angles. The two windows form the first section of a scheme for the aisle windows intended to illustrate the Te Deum.

A new Congregational Church at Cricklewood has been erected in Chichele Road at a cost of about £5,000. Accommodation is provided for about 850 worshippers. Messrs. Spalding & Spalding were the architects.

The Monument to Musset now being executed by M. Antonin Mercié is the subject of animated discussion. It is believed that finally the monument will be placed in front of the Théâtre Français, Paris, where the author's work was so often in evidence.

The Sanctuary of the Parish Church of Whippingham is being enlarged and a reredos erected as a memorial to Queen Victoria. A portion of the chancel roof over the sanctuary will undergo alteration, and the chancel floor is to be partly laid with marble.

The Isle of Wight Memorial to Queen Victoria takes the form of a graceful column, supported by figures emblematical of the regal virtues, guarded by lions couchant. It is being erected in the market square at Newport. The figures and lions will be executed in bronze.

A new Primitive Methodist Chapel at Leeds is being erected in Harehills Avenue. There will be a school building attached. The buildings are from the design of Mr. W. H. Dinsley, of Chorley, and are estimated to cost £6,500. The chapel will seat 500 worshippers and the schools will accommodate 300 children.

The new Westminster Cathedral.—Cardinal Vaughan has decided upon the immediate decoration of the Blessed Sacrament Chapel in the new Westminster Cathedral. Its construction has cost about £5,000, and its decoration with marble and mosaics is estimated to cost at least £12,000. Towards these sums his brother, the Rev. Kenelm Vaughan, has collected in Spain and South America over £13,000.

M. Raphael Brown, the well-known inspector of Beaux-Arts in Paris, concludes his term of office at the end of the year. In consideration of his excellent services in the cause of art he has been invited to continue his duties indefinitely, and he will shortly be engaged with M. Bouvard in the reorganisation of the municipal service of fine arts in Paris. It is expected that a great many changes will take place in the personnel of the museums.

A Statue to Shakespeare is to be erected at Copenhagen in the open space between the town harbour and the railway station. It will face the so-called "Hamlet Terrace" of Kronborg Castle, on which Shakespeare laid the scene between Hamlet and his murdered father, and thereby indissolubly coupled the name of Elsinore with his own. The work of executing the bust has been entrusted to M. Hasselrus, a Danish sculptor residing in Rome.

The Church of St. George, Botolph Lane, has been closed on account of its unsafe condition for several years. It has, however, remained standing owing to the dilatory procedure of the Ecclesiastical Commissioners, and the inability of the various authorities concerned to arrive at an amicable settlement of the various questions involved. Now the scheme of union with the Church of St. Mary-at-Hill has been finally approved and signed, and no further obstacle stands in the way. As a preliminary towards the demolition of the church, the sanitary authorities of the City are taking action with a view to securing the removal and reinterment of any human remains that may be buried in the vaults or the churchyard. The actual work of demolition will, it is expected, be proceeded with in the course of a very short while. The monuments and other features of interest which the church contains will be removed to and re-erected in the Church of St. Mary-at-Hill.

The new Roman Catholic Cathedral at Norwich, which the Duke of Norfolk is building, is progressing apace. The nave has been finished for some time, and is used for services, while the walls of the east end and transepts are now raised as far as the crowns of the arches of the first storey. The cathedral has a magnificent site, and on its tower it is proposed to place a beacon light which will be visible at sea. The interior is a fine example of work in the Early English style, and is treated with a reticence and even severity which gives it, for a modern building, an unusually impressive effect. The architect responsible for the plans was the late Sir Gilbert Scott.

New Patents.

These patents are open to opposition until November 3rd.

1901.—Pile Drivers.—16,738. T. Möbus, 12, Goethestrasse, Carlottenburg, Germany. This invention relates specially to pile-driving under water. The monkey slides up and down in a tube which encloses the upper end of the pile. The driving is thus not retarded by the monkey having to pass through the water, and, also, extra long piles are not required.

Trench-cutting Machines.—18,061. E. Schofield, 48, Winfield Mount, Blackman Lane, Leeds. The machine consists of a series of cutters which work down the side of the trench, in combination with a chain bucket elevator for raising the material to the surface, where it is discharged on to a chute. The machine is driven by any convenient power and takes up a space of about 5ft. from front to back in the trench: the sides of the latter can be immediately propped up, and the depth of the excavation can be regulated whilst the machine is working.

Firebrick Arches for Boiler Settings.—19,052. H. W. Foxworthy and R. W. Moore, 61, Strathblaine Road, Clapham Junction, London, S.W. The bricks are formed with rebates and joggles on their radial faces so as to interlock with adjacent blocks, and thus compensate for the expansion and contraction caused by the extreme variations of temperature to which they are necessarily subjected.

Float-Actuated Taps.—21,147. W. Bradley, 18, Collegiate Crescent, Broomhall Park, Sheffield. The valve is opened full by the float lever and kept so by the water pressure; similarly it is closed suddenly and held closed by the water pressure.

Keys for Drawing Instruments.—21,340. E. Nickerson, 13A, South Place, Kennington Park, London, S.E. The key consists of a small tube or a flat piece or metal having a projecting point at one end, while another point is formed on a spring-controlled slide. The two points can thus be adjusted to fit the nut on the compass joint.

The following specifications were published on Thursday last, and are open to opposition until November 10th next. A summary of the more important of them will be given next week.

1901.—11,366, Waite, softening, filtering and purifying water. 17,805, Harris, purification of air. 17,986, Cowling, hinges. 18,154, Mobberley, floors for drying bricks, &c. 19,953, MacAuslan, hygienic dwellings. 20,257, Jones, door-fastenings for cold-storage rooms. 21,245, Selke, process of photo-sculpture.

1902.—12,261, Gumilevsky, locks and keys. 13,151, McClenahan, chipping tools. 14,998, Szöcs, vices. 16,462, Meintjes, pumps. 16,589, Williams, piles, girders, &c.

SANITARY HOUSE DECORATION. *

By LOUIS HANKS.

IN commencing the sanitary decoration of a house begin at the top, in the loft if there is one, and work downwards, cleaning and removing dirt from all recesses and hidden corners as you go: provide a skylight that can be opened, and brush down and whiten every part of the walls, floor and under-surface of roof either with limewash or carbolic distemper.

Do not leave the open joisting and rough plaster to accumulate more dirt, but put a thin flooring all over the loft and thus gain useful storage room. Where air and sunlight can enter, microbes will be conspicuous by their absence. Sunlight is a great germ-killer, wherefore all dwelling-rooms should have ample windows.

Old Wallpaper.

Descending to the sleeping apartments, and having perhaps admired the beauties of the smart new decorations, let us peel off that little piece of loose paper on the wall. To our horror we find that the "decorator" has forgotten to strip the walls before re-papering them, and here are five or six layers of dirty old paper and decayed paste, in all probability holding vermin or even the germs of disease behind the newest paper.

Let it here be uncompromisingly stated that every scrap of old paper on walls or ceilings and all old distemper should be soaked, scraped and washed off to the bare plaster, except perhaps in the case of a tightly-hung varnished or painted paper, which already presents a solid impervious surface. Insist, as one of the first principles of sanitary decoration, on the stripping of walls and ceilings, and disregard all pleas or fears as to fetching down the loose plaster. If the plastering is so weak that it is held up by the paper or old whitewash, that is surely a pretty good indication that it needs repair.

The desirability of enforcing the stripping of old wallpaper and distemper by the passing of a by-law to that effect may be commended to the attention of sanitary authorities.

Disinfectants.

Always use some disinfectant in the water employed in stripping and washing down the interior of a house, both as a sweetener of the rooms and as a protection for the workmen in case there may have been infectious illness on the premises. Safe and effective liquid disinfectants are so cheap nowadays that there is no reason for omitting this simple precaution. A solution of soda in warm water facilitates the removal of old paper and the effective cleansing of the surface. Wherever there is a sign of dampness, trace and remedy it at its source, to protect health and to prevent damage to the decorations. In slight cases it may suffice to line the damp wall-surface with lead foil or pitch-paper or to paint it before re-papering, but all serious dampness should be thoroughly removed. Having stopped all cracks or imperfections in the plaster with Parian or Keene's cement, and rubbed down the plaster to an even surface, the walls and ceilings are ready for decorative treatment, which must, of course, depend on individual taste and the finances at command.

In "clairecolling" or sizing walls or ceilings preparatory to papering, and also in the process of distempering, the smell of size is often very offensive, and this is not to be wondered at when its organic nature is considered. This odour can be almost entirely neutralised by the addition of a gill of turpentine to a pailful of melted size or distemper. This is actually an improvement to the body and binding properties of the material, as well as a deodorant.

In hanging papers, embossed pulp or canvas materials on painted or varnished surfaces, a clairecolle of size and soda should be used—half a pound of soda to a gallon of melted size—to give a "bite" to the material to be hung and to prevent blistering. The clairecolle for unpainted surfaces should be melted size with a little whiting and turps as aforesaid—no water.

Sanitary Distempers.

Many of the sanitary, washable distempers or water paints—so justly approved and largely employed nowadays—contain a percentage of turpentine, boiled oil or other vehicles, as well as an admixture of dry white lead, zinc white or soluble glass, together with some disinfectant. Such truly sanitary pigments cannot be too highly commended, as they are cheap, produce artistic and durable effects, and possess better covering properties than oil paint. One hundredweight of such a distemper will cover 840 sq. yds., while the same quantity of oil paint will only do an average of 500 sq. yds.

Paintwork.

Little need be said as to the composition or application of paint to walls or woodwork beyond urging the use of zinc white (oxide of zinc) or Charlton white as being non-poisonous and therefore more sanitary than white lead (carbonate of lead), the poisonous nature of which is well known, although it may be safely used with proper precautions. If white-lead paint is used it should be genuine old, ground white lead, mixed with pure American turps and Baltic linseed oil, with the addition of litharge driers or terebene, according to the weather in which it is used, and such paint gives off little or no odour or volatile particles. Do not use cheap white lead, as it is often adulterated with barytes (sulphate of barium), and avoid "young" or new lead, as it is deficient in covering properties and damages colour in its oxidation. White paint is the most healthful of all paints, because, apart from its artistic effect, it shows dirt better than coloured paint and thus indicates the necessity for cleaning. A glossy surface is more sanitary than a dull or "flatted" surface, as it affords less hold for dirt. In selecting papers or decorations for the walls of bedrooms, and indeed for all living rooms, avoid large staring patterns and aggressive contrasts of primary colour in masses. The less pattern there is the better; a simple background of agreeable tone is more restful and suited to a bedroom than any assertive decorative treatment.

A room simply decorated with a pale cream (not blue-white) ceiling and cornice, cream enamelled woodwork, and papered, painted or distempered walls in a tint of soft non-arsenical green or blue for a warm, sunny aspect, or in warmer tones of terra-cotta, pink or yellow for cold dark rooms, will be quieter and more soothing to the senses, and thus more conducive to repose, than more gaudy treatments.

Non-Arsenical Paperhangings.

In purchasing paperhangings take care to procure them from a firm of repute who can furnish an authentic guarantee that no arsenical colours or other poisonous ingredients are employed in the process of manufacture.

The fermentation of the paste used in hanging papers and relief materials is a danger which can be avoided by the addition of a lump of alum, the size of a filbert, to a pail of paste. This helps to thicken the paste, giving better and more adhesive body, as well as having a hardening and non-fermentive action. The addition of a small quantity of oil of cloves also assists in checking fermentation.

Lastly we have to consider the floor, which should be sized and varnished all over, merely having a loose rug, thus providing a thoroughly sanitary surface which can be kept clean and germ-free without the use of the scrubbing brush. All open joints should be stopped to prevent dust dropping through into the space beneath. Permanganate of potash is an excellent dark stain for clean boards, and has the additional merit of its disinfecting qualities.

The same general principles apply also to the decorative treatment of the reception-rooms, staircase, &c., elaborated to whatever extent artistic inclinations or means permit.

Paperhangings, where used, should be preferably those with a hard smooth surface, such as the hot-pressed silk fibres or oil printed papers, not flocks nor mica papers, which catch the dusts and whose particles become detached in course of time, thus failing to comply with sanitary requirements.

Painted and panelled walls and ceilings, hand-painted decorations of flat ornament in monochrome, colour or stencilling, with the embellishment of gilding in mouldings, and other ornamental details; plaster or compo-mounted enrichments, hardwood panelled wainscoting, parquet floors, and every kind of decorative treatment that does not afford absorbent surfaces or dust-collecting ridges, shelves or scrolls, may be freely employed in an entirely sanitary scheme of decoration.

Bathrooms, &c.

In bathrooms and closets do not have wooden enclosures to baths, sinks or w.c.'s, as such places frequently serve to harbour filth, and thus become a nuisance. Let every part of the sanitary fittings be open and above board, so that any leakage can be detected and every part accessible for daily cleansing. Corners behind w.c.'s, and corners of rooms generally, would be more hygienic if slightly rounded to prevent the collection of dirt. The walls of bathrooms, lavatories and the domestic offices should be covered with varnished paper, paint or, preferably, with ceramic or enamelled metal tiling, so as to be impervious and washable. The latter forms of wall-covering are strongly to be advocated for larder, pantries and store-cupboards. The floors of bathrooms, w.c.'s and lavatories, also larger, should be cemented or asphalted.

Mosaic of marble or glass is a material more often employed for the flooring of halls, steps and lavatories in this country than for mural decorations, due chiefly to questions of cost, but it is a matter for regret that this sanitary, artistic and durable material is not more largely used for decorative purposes.

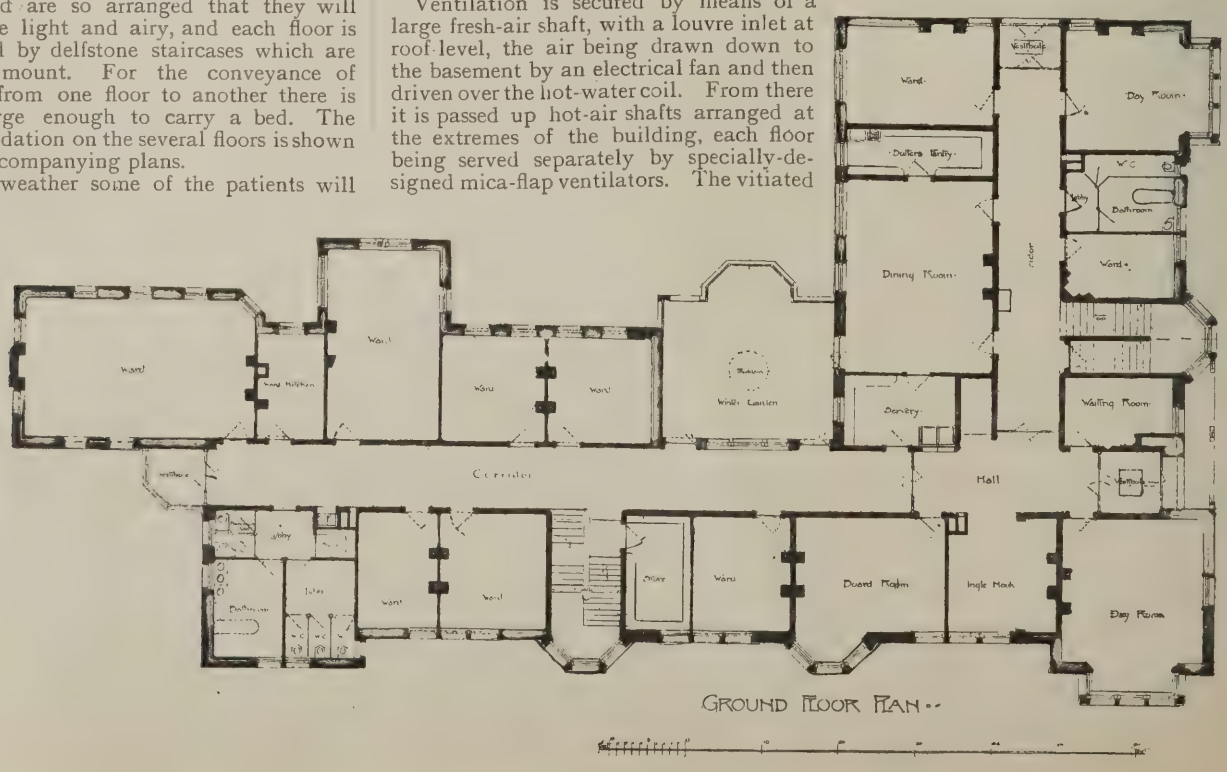
In conclusion, a word may be given to the necessity for ample inlet and outlet ventilation for every room, to promote the health of the occupants and to preserve the decorative adornments. The least injurious form of artificial lighting in all respects is, of course, the incandescent electric lamp, and where gas is used every burner should have outlet ventilation to carry off the fumes. Carefully search for cupboards under stairs, also cellar or vaults. See that all such places have cement floors. Limewash them twice a year, and do not let lumber and dirt accumulate. Abolish brick or wood dustbins, and have iron portable bins. Bear in mind that soap and water, fresh air, sunlight and cleanliness in general are as much to do with health as elaborate drainage and the complications of modern plumbing, and there is the advantage, moreover, that such simple things are within the reach of all—the poor as well as the rich.

* Summary of a paper read before the Congress of the Sanitary Institute held at Manchester from September 9th to 13th, 1902.

A Reredos at the Royal Artillery College, Sandhurst, is to be erected as a memorial to officers who fell in the South African War. Mr. Bodley is the architect.

YORKSHIRE HOME FOR INCURABLES HARROGATE. T. E. MARSHALL ARCHITECT.

A HOME FOR INCURABLES.



"FOR sufferers reduced in circumstances through long-continued affliction"—this is the motto of the Yorkshire Home for Incurables illustrated on this page. It has been built from plans by Mr. T. E. Marshall, architect, of Harrogate. The building is constructed of Pateley stone and has a frontage of 157½ft. to Cornwall Road. To the side road which leads to Harlow Moor there is a frontage of 85ft. The corridors are 8ft. wide, and are so arranged that they will always be light and airy, and each floor is connected by delfstone staircases which are easy to mount. For the conveyance of patients from one floor to another there is a lift large enough to carry a bed. The accommodation on the several floors is shown by the accompanying plans.

In fine weather some of the patients will want to get out into the open air and enjoy the sunshine and health-laden breezes. Their requirements in this respect have been provided by an 8ft. 6in. terrace, which extends round one-third of the building and slopes gradually down to the garden paths. At the first-floor level there are asphalt airing-flats for the patients, opening into corridors by wide doors.

The floors to each of the corridors, bath-rooms and the other principal rooms are constructed with iron joists, cement-concrete and wood blocks or terrazzo.

Ventilation is secured by means of a large fresh-air shaft, with a louvre inlet at roof-level, the air being drawn down to the basement by an electrical fan and then driven over the hot-water coil. From there it is passed up hot-air shafts arranged at the extremes of the building, each floor being served separately by specially-designed mica-flap ventilators. The vitiated air is afterwards drawn into the chimney breasts at the ceiling level.

The building provides accommodation for nearly 100 patients. It will be noticed that, for the convenience of the patients, the kitchens and the domestic offices are situated at the top of the building. The home has cost about £15,000, and another £1,500 will be required for furnishing. Towards this sum £10,243 has been already subscribed, but the balance is wanted. It will doubtless be speedily subscribed. This is not a local institution, but a county home; and as showing

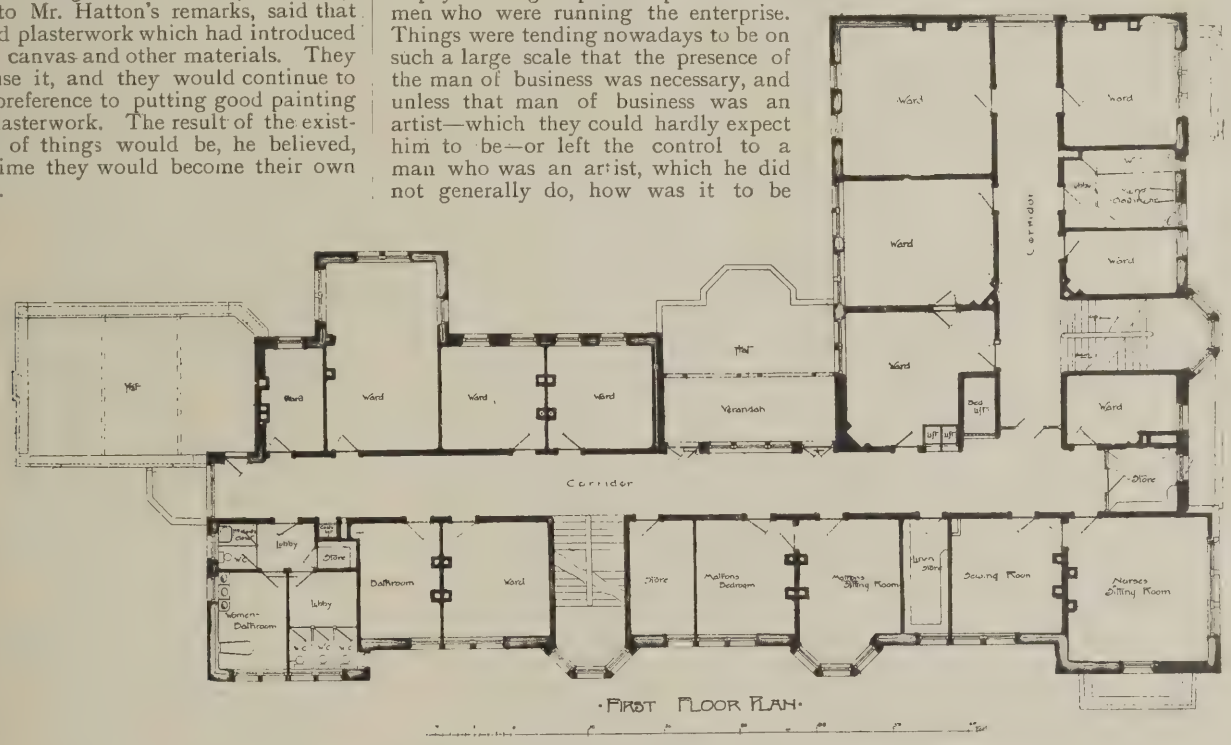
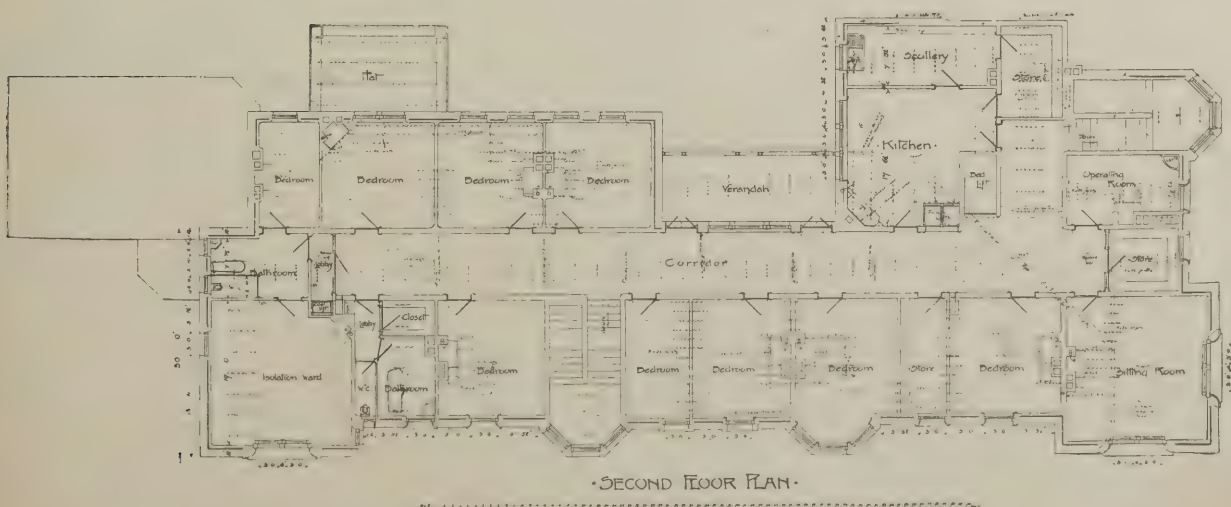
what can be done in a small way it may be mentioned that one collector has gathered during the past nineteen months no fewer than 12,000 pennies.

PAINT AND THE PAINTERS.

THE annual convention of the National Association of Master House-Painters and Decorators of England and Wales was held last week at Newcastle-on-Tyne.



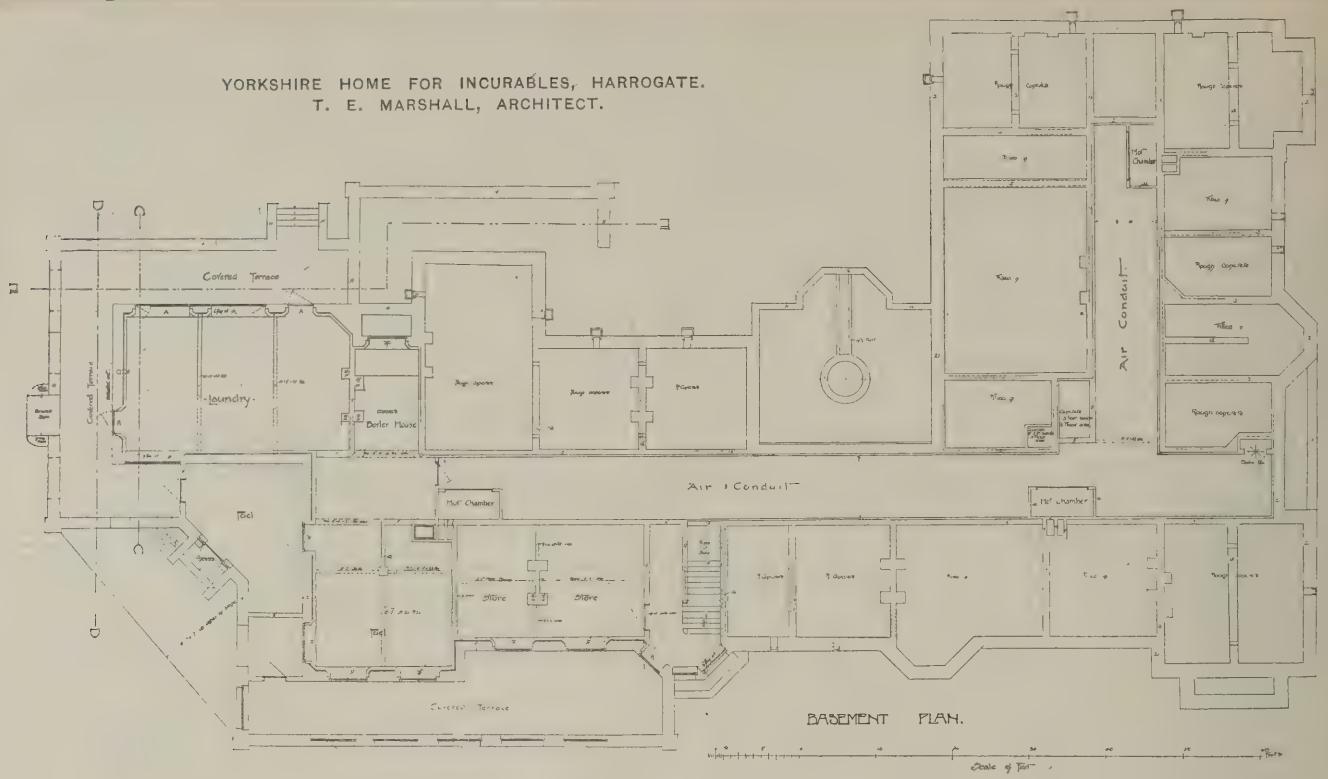
Embossed Papers.



Mr. R. G. Hatton, head art-master at the Durham College of Science, said in the course of a paper that there seemed to be arising an epidemic of embossed papers, and while not saying a word against them he was of opinion that they tended to drive out the need for certain skill on the part of the decorator which he formerly had. It was only natural to think that there would be a tendency for using these appliances which would gradually eliminate the craft of the decorator, and the man who was jealous of his craft would look askance upon the introduction of any mechanical means which would tend to reduce the skill of hand and eye. Mr. George G. Laidler (Newcastle), alluding to Mr. Hatton's remarks, said that it was bad plasterwork which had introduced embossed canvas and other materials. They had to use it, and they would continue to use it in preference to putting good painting on bad plasterwork. The result of the existing state of things would be, he believed, that in time they would become their own plasterers.

Mr. Lewis F. Day and the House Painter.

Mr. Lewis F. Day read a paper on "The Art and Trade of the House Painter." He said there was a time when all art was decorative, but that had changed altogether, for now decoration was only a division of art, and house decoration only a division of that. Art and craftsmanship were inseparable. It was difficult to draw a hard and fast line between them. The moment the consideration of beauty, apart from utility, entered into the calculation of the workman, he touched upon the domain of art. It was all but impossible for a man to carry workmanship to its furthest point without concerning himself about its beauty, and that was art. It was quite possible, nevertheless, for a man to carry on his trade without a regard for art. The modern change was due largely to the fact that whereas house-decoration used to be in the hands of the workman, or under the direction of a man who had been a workman, the tendency was more and more to the trade getting under the control of the enterprising man of business. The mischief was not that the decorator had to make it pay, but that the desire to make it pay so well was so strong that the workman and his best qualities were being swamped by the necessity for making the enterprise he was engaged in pay the largest possible profit to the men who were running the enterprise. Things were tending nowadays to be on such a large scale that the presence of the man of business was necessary, and unless that man of business was an artist—which they could hardly expect him to be—or left the control to a man who was an artist, which he did not generally do, how was it to be expected that the work done under such auspices should be artistic. Art of any kind, he admitted, did not sell best, but it paid. It was the best advertisement; it made people talk, it spread the decorator's fame, and perhaps brought customers for trade work. Was there ever a better advertisement for drain pipes than art pottery?; and what applied to pottery applied to house decoration. The good artist with practical qualifications and no desire to undertake more than he could personally supervise could always make a living, and, if anybody was to be envied, perhaps he was the man. But the point to which he wished to call their attention was that the house decorator need not be a great artist—need not, in fact, have much more than a workmanlike appreciation of good work well done—to raise his trade to something of an art, if he only had his ideal and the courage of it.



A New London Theatre.—We are informed by Mr. E. G. Saunders, of the Saunders Theatres Ltd., that Mr. W. G. R. Sprague is designing for him a new theatre to be erected on the Strand corner of the new Crescent facing Waterloo Bridge. Mr. Sprague also designed the Coronet and Camden theatres for Mr. Saunders.

YORKSHIRE HOME FOR INCURABLES. T. E. MARSHALL, ARCHITECT.

YORKSHIRE HOME FOR INCURABLES, HARROGATE.
T. E. MARSHALL, ARCHITECT.

Trade and Craft.

A New Material for Urinals.

Mr. William E. Farrer, of 36, Cannon Street, Birmingham, is introducing a new material for urinals, called "Torfit." It is made from prepared peat, the word itself being German for turf. The peat is shredded and cleansed, mingled with a powerful chemical disinfectant, and pressed under hydraulic pressure of 800 tons into slabs, channels, &c. It is then dried for nine months to give it the necessary hardness for handling and fixing. The floor channel and divisions of the urinal are formed in the ordinary way and the backs finished with a moulded coping. After fixing, all that is necessary is to brush over the material with a chemical extract supplied with it: and this solution (which is of an oily nature, but is absorbed without any residue being left) is such that when the urinals are used the urine itself is disinfected immediately it strikes the backs, and is not in the slightest degree absorbed into the material, but passes away along the floor channel in a deodorized condition. The outlet trap contains a small quantity of the liquid extract, and before the urine reaches the drain it is rendered innocuous. In addition, there is no smell, deposit or furring. Even in places where the urinals are very extensively used it is only necessary to brush them over with the extract about once a week. The material has been in use on the Continent for the past six or seven years—though in matters of sanitation it is usual to find English practice far ahead of the French or German—and among other places it is adopted at the North German Lloyd's shipping and engineering yards at Bremen, while, coming to our own country, Mr. Farrer has fixed several ranges in Birmingham which are giving every satisfaction. A good feature of the material is that, by turning slightly white, it shows when it is necessary to brush it over with the disinfectant; and it is claimed that the saving in water alone, based at 7d. per thousand gallons, will cover its cost in less than two years. The cost per stall is about half that of ordinary circular backs, and the maintenance about 2s. 6d. per year per stall.

School Furniture.

Of school furniture the folding or sliding partition is the most useful as it is the most recent development. A large room can be divided up into small rooms for classes, and reconverted into a hall again, by the simple sliding or folding of these partitions. In constructing them, however, there are several points to which special care needs to be given, notably the manner in which the sections are hung or mounted. The Educational Furnishing Co., Ltd., of Stourbridge, make a speciality of ball-bearing partitions each door of which slides and opens separately. A boy can manipulate such a partition, and when folded back against the walls it is very compact. The track on which the shutters run is flush with the floor, thus giving a perfectly level surface when the partition is open, while the tops of the shutters have a strong pin fitting into an iron groove, so that it is impossible for a shutter to fall out. The firm also supplies all kinds of furniture for schools, such as desks, cupboards, bookcases, tables, &c.

A Well-Tried System of Glazing.

Glazing bars have proved almost as attractive to the inventor as window-fasteners, and it might reasonably be thought that every possible form had long since been devised; but of this huge collection there are scores which are nothing more than the untried ideas of trade cranks or mere duplications of sections that have been proved to be defective. There is indeed but one real test of a glazing bar—the test of time. Hope's patent system has been tried in this manner, having been extensively employed for various large public buildings, hospitals, schools, works, warehouses, &c., throughout the country; among which may be mentioned the West Ham Technical Institute, the Birmingham Meat Market, the Park Hospital at Lewisham and the London Hospital in Whitechapel, Trinity College, Cambridge, and the works of the British Thomson-Houston Co. at Rugby, of Vickers, Sons & Maxim at Sheffield, Fry's chocolate works at Bristol, and Doulton's factory at Burslem. A system which has thus been employed needs no bolstering up. We may, however, state the following points of merit claimed for it by Messrs. H. Hope & Sons, Ltd., of 55, Lionel Street, Birmingham (London office: 39, Victoria Street, S.W.):—The glass has a good bearing on the bar, and is not supported on its extreme edges; there is ample allowance for expansion and contraction; the lead capping is so attached that all fastenings are dispensed with and derangement is made impossible, while its form allows it to be turned up and down without an angular bend, and it cannot be cut by the edges of the glass. The oiled asbestos cords, fixed in grooves, provide a plastic but imperishable seating material, which makes a perfectly dust-tight joint and enables long sheets of glass to lie evenly on the metal bars; the lead capping has a solid ridge projecting above the glass, and no injury can be done to it, nor glass broken, by placing planks across the roof; the stops for the glass are made of gunmetal and secured to the bars with strong copper rivets; the weight of the bars and glass is carried entirely by the purlins, and there is no weight upon the fixing screws. Only glass and lead are exposed, and consequently painting is dispensed with.

Dust-Removal by Vacuum.

In our issue for June 4th last we published some particulars of a device for removing dust in upholstery, draperies, carpets, &c., the patent of the Vacuum Cleaner Co., Ltd., of 25, Victoria Street, London, S.W. A booklet has now been sent to us giving, in addition to a full illustrated description of this useful invention, prices at which the company undertake cleaning work. A list is also given of some of the places where the device has been used—as, for example, the Savoy Theatre, where 82½lbs. of dust were removed, the Palace Theatre (228lbs.), the Midland Hotel at St. Pancras (196lbs.), the Kennington Theatre (382lbs.), and part of the corridors, tea-room, &c., in the House of Commons (25lbs.).

Fire at the New War Office Buildings.—Just before midnight on Wednesday one of the crane platforms at the new War Office buildings in Whitehall was found to be on fire, the outbreak being due to the overheating of a boiler. Firemen from Scotland Yard were speedily on the spot, and the flames were extinguished after slight damage had been done to the platform.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
	BUILDING:		
Oct. 2	Carbis Bay—Church	Wesleyans	O. Caldwell, Architect, Alexandra Road, Penzance.
" 2	Wolverhampton—Hospital	District Hospital for Women Management Committee.	A. E. Painter, 43 Lichfield Street, Wolverhampton.
" 2	Chelmsford—Offices	County Council	F. Whitmore, County Architect, Duke Street, Chelmsford.
" 2	Sidmouth, Devon—Hotel	Hotels Co., Ltd.	R. W. Sampson, Architect, Manor Offices, Sidmouth.
" 2	Manchester—Cooling Towers, Workshops, &c.	Electricity Committee	F. E. Hughes, Secretary, Electricity Dept., Town Hall, Manchester.
" 2	Llantwit Major, Wales—Cattle and Sheep Mart		Mr. Miles, Solicitor, Cowbridge
" 2	Woolwich—Clearing Site for Municipal Buildings	Borough Council	A. B. Thomas, 5 Queen Anne's Gate, Westminster.
" 3	Lightcliffe, Yorks—Four Houses		J. F. Walsh & G. Nicholas, Architects, Museum Chambers, Halifax.
" 3	Coombe, Newlyn—Stores	R. R. Bath	H. Maddern, 26 Clarence Street, Penzance.
" 4	Greatford, Stamford—Room at School		Greatford School, Stamford.
" 4	Halifax—Two Villas		G. Buckley & Son, Architects, Tower Chambers, Halifax.
" 4	Hoole, Chester—Walling and Fencing	Urban District Council	A. E. Caldecutt, 17 Newgate Street, Chester.
" 4	Dronfield, Derby—Isolation Hospital	N. Derbyshire Hosp. Committee	G. E. Bolshaw, 189 Lord Street, Southport.

CAW'S Famous FOUNTAIN PENS.

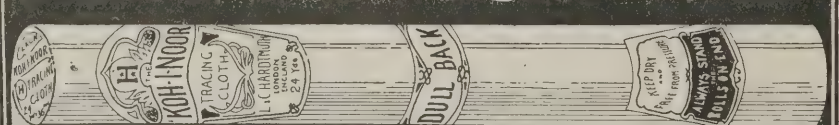
Popular all over the World.

No. 341 Plain. Price, 12/6.

The New Patent "SAFETY" PEN. The best production of its kind. It is different from all others. Absolutely air and ink tight. From **12/6** to **26/-** each.

The "DASHAWAY" PEN. Beautifully made and finished. It has a Double Feed which never fails. From **10/6** to **24/-** each.

The "EASY" PEN. A most useful Pen suitable for all work From **8/-** to **16/6** each.



The "DAINTY" Pen. An ideal Pen for Ladies. No larger than lead pencil. **5/-** and **9/-** each.

Illustrated Catalogue, giving full particulars, to be had of all Stationers, or of the Sole Wholesale Agents:—

EYRE & SPOTTISWOODE, Great New Street, LONDON, E.C.

SAMPLE FREE ON APPLICATION.

ABSOLUTE

L. & C. Hardtmuth's "KOH-I-NOOR" TRACING CLOTH.

Like the KOH-I-NOOR pencils the finest ever produced and will be appreciated by every Architect and Draughtsman.

PERFECTION.

Unquestioned Supremacy amongst Pencils held by the KOH-I-NOOR.

L. & C. Hardtmuth's **KOH-I-NOOR** Pencils give the most entire satisfaction. The name Hardtmuth is a guarantee of excellence. The pencils do what is expected of them—sharpen to a fine point, do not snap off, and **prove the most economical in use.** The quality never varies. Made in 17 degrees, for all purposes!

Awarded Grand Prix at Paris 1900.

"SPECIFICATION."

THE STANDARD TECHNICAL AUTHORITY

1903.

5/=

Per annum.

THE PROPRIETORS call attention to the fact that they have received a large number of letters which speak of the 5th Edition of this work in the very highest terms, thus proving its incalculable value to

ARCHITECTS,
SURVEYORS,
ENGINEERS,

And all interested in the BUILDING and KINDRED TRADES.

The following are a few Extracts from some of these letters:—

"I have just received SPECIFICATION which I think is an indispensable book to all engaged in Municipal and Sanitary Work."

From an Inspector of Nuisances.

"If I may, I should like to add my good opinion of SPECIFICATION. As a Technical Reference it is most excellent. Several volumes in one. One would hardly like to be without it now."

From an Engineer and Surveyor.

"I have found SPECIFICATION exceedingly useful as a work of reference."

From an Engineer in the Malay States.

"The last number was the most useful book I ever had."

From a Surveyor.

"I consider the work should be in the office of every Architect, forming, as it does, in its plan and scope an invaluable source of reference in every point likely to be raised in ordinary architectural surveying practice."

From an Architect.

"SPECIFICATION is a splendid book and I will bring it before my students' notice."

From a Technical Instructor of Birmingham.

"SPECIFICATION has the World for its field. It is excellent in every department."

From a Water Engineer.

The Work can be obtained through any Newsagent, Railway Bookstall, or direct from the Publishers. Descriptive Pamphlet with full List of Sections and Summary of Special Contents will be sent free on application.

An Architectural Causerie.

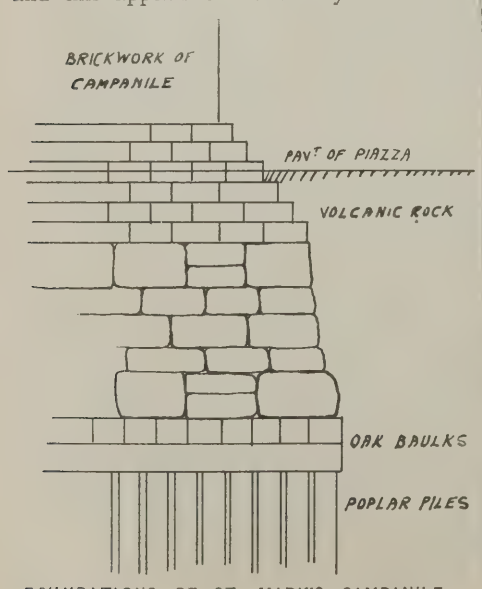
Off with his Head.

Evidently William Hunter, builder, of Belfast, is a man of a warlike disposition, with a terrible gleam in his eye and a threatening gurgle in his throat; and evidently William Gillespie, building inspector to the Belfast Corporation, is a man of perseverance, though he is wise in thinking that neck or nothing is not always a profitable maxim to adopt. Hunter is just one of those men who do not build for eternity. Last year there was a house of his on the Shore Road at Belfast, but somehow or other the mortar was made of scrapings—perhaps a little experiment—so the Corporation allowed a fine of £5 as a recognition of the builder's ingenuity. But, not long after, the house tumbled down and when, phœnix-like, it rose from its ashes (this is of course a metaphor, and it would perhaps be better to say, when it rose from its scrapings) the persevering building inspector found that the new work was no better than the old. Consequently he objected, and it was at this point that Hunter showed his hand—aye, his teeth as well, and maybe his tongue; for he stopped Gillespie on his round of inspection and threatened that if he put his foot on the job he would break his neck. And the inspector said nothing. But he seems to have moved, for we next learn that if he proceeded any further this fierce builder would break his skull. In face of such dangerous conditions, what did Gillespie do? Did he venture and have his neck or his skull broken, or both? We are told that he "proceeded with his inspection," and then it was the builder caught him by the throat, pushed him off the premises, and threatened to cut off his head if he put a foot on the building again. And what happened? The Bench fined this building ogre 40s and costs: and Belfast in future will probably be a more tolerable place for the building inspector.

Disgraceful.

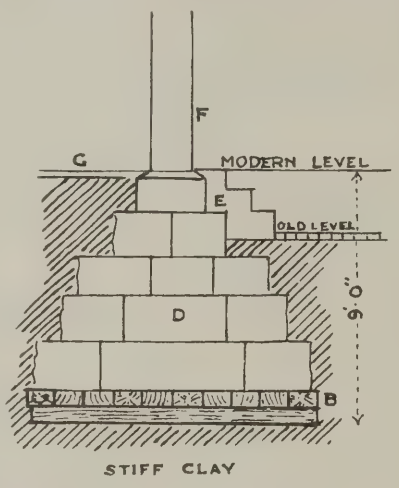
The Bristol Board of Guardians has behaved most scandalously in regard to the proposed new infirmary for sick poor. The existing workhouse at Eastville is inadequate, and the sick are housed in badly situated wooden buildings, where the danger of fire is "something awful." This being the case, it was proposed three years ago to build a new infirmary. A deputation visited various large unions and infirmaries, the Guardians settled the general arrangements of their new building, competitive designs were invited and premiums of £200, £150 and £100 offered. Mr. H. Percy Adams, F.R.I.B.A., was the successful architect, and according to his designs specifications and particulars of quantities were drawn up and tenders advertised for. In response, sixteen building firms submitted tenders for their own particular work and seventeen other firms sent in tenders for the supply and erection of steam boilers, laundry machinery, &c., while other tenders were received for the electrical work. The matter came before the last meeting of the Board of Guardians, when the New Infirmary Committee recommended the acceptance of the second tender on the list (that of Messrs. Kerridge & Shaw, Cambridge, builders' work, £118,975), Messrs. J. Hodson & Son, of Nottingham, having asked permission to withdraw their tender, which was the lowest (£114,950). The lowest tender for the boilers and general engineering was £10,858 and for the electrical work £5,580; so that altogether the cost came to £135,413, the architect's estimate being £141,000. Now the Bristol Board of Guardians, by thirty-two votes to twenty-five, has rejected their Committee's recommendation. This, as we said at first, is a scandalous proceeding. There is no need to elaborate the facts—anyone can see what a disgraceful waste of time this decision means. The Committee stated that the new infirmary would add ½d. in the £ to the rates. It is futile, as one member of the Board did, to say that when the scheme was put forward the city was not pledged to an expenditure of two millions on the docks. Their architect's estimate is nearly £6,000 above the contractors' tenders and the Board should have decided then whether or not they could afford the expense; instead of which they put people to incalculable trouble and then drop the scheme. The whole thing is a muddle and a disgrace to them.

St. Augustine's, Kilburn.



The addition to these schools gives a large classroom on each upper floor, and an external staircase (not shown by the illustration on this page) communicating with the middle floor and the playground, which is below the street level. Lavatories are provided on the ground floor. The work was carried out by Messrs. Beatley Brothers, of Kilburn, under the supervision of the architect, Mr. Harry Sirr.

THE FOUNDATIONS OF VENICE.



By ROBERT W. CARDEN, A.R.I.B.A.

THE great Campanile of St. Mark, at Venice, has already fallen, and for at least the third time the papers are calling attention to the dangerous condition of the Ducal Palace. The time is therefore opportune for a few notes on the foundations of Venice generally.

When the inhabitants of the Venito—in the ninth century—decided finally to quit the mainland and build for themselves the mighty Republic, the islands which they selected, and upon which Venice still stands and will continue to stand in spite of the evil prophecy of many modern prophets, were barren marshes slightly raised above the level of the waters of the surrounding lagoons, with no particular vegetation save for a few isolated thickets. But situated as these islands were, useless for agricultural purposes and impregnated with sea salt, they possessed an advantage which rendered the building of the city possible; and this advantage lay in the long sand banks, or *lidi*, which are situated to the east of Venice and protect the city from the force of the open sea. The Venetians early realized the value of these natural outworks, and protected and rendered them permanent by the building of sea walls on either side of the sand-banks, the chief and strongest being towards the open Adriatic. By this means Venice was guarded against the possibility of being overwhelmed by storms, and as there were but two narrow navigable channels between these outworks the chances of attack by a foreign fleet were remote. The lagoon in which Venice lies is the "*laguna viva*," or tidal water, but even here there is only a 2ft. tide, while in some of the smaller lagoons nearer the mainland there is no tide at all. Thus we find that these unattractive little islands were better than they might have been, and, such as they were, were likely to remain indefinitely, for there was no thundering surf to incessantly beat against their mud-banks and overwhelm them, and very little tidal action to make inroads by a slower and more insidious attack. We are told that before the basilica of St. Mark was founded its site and a portion of the Piazza were an open grassy field with rows of trees and a canal down the middle. The western half of the square was divided from the portion already mentioned by another canal which was filled up in the twelfth century, and the two halves united into one large space. A third area was added in the sixteenth century, and this appears to be wholly new-made ground. All the buildings, therefore, which compose the celebrated group around the Piazza di San Marco were built upon solid ground, excepting the Procuratie Nuove on the south side of the square, which stands upon the third addition to this site. The basilica and the threatened Ducal Palace stand upon solid ground which has been in existence ever since Nature framed the lagoon. As for the unhappy Campanile, that too stood upon solid ground, but when first founded the western front—the side which is seen in the best known view of this group showing the length of the square, St. Mark's, the Campanile, the Ducal Palace and a corner of the Library—was washed by, or lay close to the water which previously occupied the spot where the Procuratie Nuove now stands, as already stated.

FOUNDATIONS OF ST. MARK'S CAMPANILE

FOUNDATIONS OF THE DOGES' PALACE.
B, oak planks; D, footings of trachyte and other volcanic stones; E, stylobate now hidden by modern pavement; F, one of the Istrian stone pillars of the palace; G, paving of loggia.

The sub-formation of these islands is, considering their small extent and the numerous interesting canals, remarkably solid, and borings which were from time to time made in sinking wells have revealed a regular succession of good foundation earths. It is true that the upper stratum of from 10ft. to 16ft. in chiefly sand in composition, but below this is a bed of stiff clay lying on another of sand and gravel; below this is an inconsiderable stratum of peat, and below this point come more stiff clay, gravel and peat in regular succession down to the lowest point the borings have reached, about 500 metres in depth, or 1,500ft. It has been stated more than once recently that sheet-piling was resorted to in addition to the ordinary piles, but it seems more probable that the sheet-piling is simply strutting. Well knowing the geological formation upon which they were building, and building as they did monuments to stand for all time, the Venetian engineers took the trouble to excavate the 16ft. of sandy soil which lay between the surface and the clay, and in so excavating must have found it necessary to use strutting to retain the sides of the pit; and this strutting was left in after the foundations were laid and the ground filled in, thus giving rise to the idea that sheet-piling had been driven. That this was not the case is obvious, for the stiff clay would need no lateral confinement with piling, and the sand had already been excavated. To describe the method of forming the foundations of the Campanile would be merely to repeat what has already been published in the columns of this journal, but, so far as the writer is aware, no attempt has been made to arrive at the actual bearing capacity of the base. The base is a square of 12·80 metres, or nearly 42ft., and the piles used were (circular) 0·26 metre in diameter, or 10·24in. nearly. From the description these piles were placed "nearly touching"; so that, assuming 34 piles in each row, this calculation would allow a distance apart of 4·58in., and is probably greater than the actual fact, and consequently the bearing power would be greater than that given in these figures. Piles driven *to* solid ground (these were *entirely* driven *in* solid ground throughout their whole length) are capable of bearing a stress of 1,000lbs. per sq. in. of head. The equation reads:—

$$BW = \frac{22}{7} \times 5{\cdot}12 \times 5{\cdot}12 \times 1{,}000 \times 34 \times 34,$$

which gives a result of 95,240,659lbs., or 42,696½ tons. This estimate is intentionally low, and while the actual weight to be borne was about 22,000 tons the bearing capacity of the base was, more likely, 50,000 tons. The material forming the offsets of the base has been roughly described as trachyte, but as it was brought from the Euganean Hills (near Padua, 23 miles away) it is more likely to be liparite or rhyolite, a volcanic rock of immense hardness and occurring in the form of erupted lavas. As laid under the Campanile, it was capable of sustaining something like a hundred times the task imposed upon it, and consequently the cause of failure does not lie here.

The foundations of all the buildings in Venice are laid in the same manner and with similar materials, except for one important change, namely, that in many buildings erected during and after the fourteenth century the piling was omitted and the oaken raft laid direct upon the stiff clay. The substructure of the Ducal Palace is of this latter type, and it would seem as if there was more cause for anxiety here, as the building being carried on open arcading it follows that the whole weight of the external walls with half that of the floors is collected upon small isolated points of support. Not only this, but the floors are overladen with objects of art, chiefly volumes from the Library of St. Mark, and it is to these that the cause of the cracks which have recently appeared in the fabric is attributed. Each of the supporting columns has a trachyte or similar base upon a raft which extends 10ft. each way and gives a bearing area of 100 sq. ft. in a soil which probably is capable of supporting not more than a ton per ft. super.

It is more than likely that the foundations of Venice have now nothing but the superimposed weight to hold the stones in position, for the mortar used was perforce of inferior quality. The only limestone available for calcining into lime was that of Istria, a stone which possesses not the slightest atom of hydraucity, and we know from the example of the Campanile that in that case it had entirely crumbled to a useless powder. Not until Venice conquered Padua in 1405 were the builders of the Republic able to obtain hydraulic lime, but after that date the Paduan quarries of Albettone were at their disposal, and they obtained thence an exceedingly strong cement which came into universal use and continues to defy salt water and sea air.

Welbeck Abbey.—The boudoir at Welbeck Abbey illustrated on the opposite page is part of the new work in the "Oxford Wing," the outside stone walls only remaining after the recent destruction by fire and water. This lofty room is about 33ft. square. The style followed is Italian of the Cinquecento period. The tall chimney-piece and the doorways are of Istrian marble, with delicate Raphaelesque carving. The doors, pilasters and woodwork generally are of Italian walnut, as is also the coffered ceiling. The latter has gesso enrichment on the soffit of the beams, the carved swags and mouldings on the panels being lacquered. The walls are of green silk. The works of reconstruction and decoration at Welbeck are in the hands of Messrs. Ernest George & Yeates, architects, Messrs. Trollope & Sons being the contractors.

THE HIDDEN MODELS OF ST. PAUL'S.

ST. PAUL'S CATHEDRAL is full of discarded relics, out of which an interesting museum might be formed. Foremost is the great wooden model which Wren himself made, showing his first idea of the cathedral, without a nave, and without the side towers. Poor Wren had a "Board" to deal with, and was controlled and hampered at every turn; but perhaps it is as well that he was forced to build a nave, seeing the enormous crowds with which the church is occasionally filled on festival or ceremonial occasions. Of the earlier church no models exist, but fragments of it may be traced, and in the library, over one of the aisles, are remains of still earlier temples, Roman and British (or Saxon), which were unearthed at the rebuilding, or else during Mr. Penrose's excavations to determine the foundations of Old St. Paul's.

Outside the library is a series of huge coloured cartoons, displayed upon the walls, Sir Edward Poynter's and the late Lord Leighton's designs for the decoration. Leighton's picture, "The Sea giving up its Dead," was designed for this purpose, and exists as a cartoon fifteen or more feet in diameter.

More interesting than these is the complete series of models—sections of a doll's cathedral—showing on a small scale the architectural alterations and decorations of the interior proposed by a succession of artists. The earliest was Alfred Stevens, whose rough designs for the spandrels of the dome were actually carried out in mosaic by Salviati of Venice, after Mr. G. F. Watts and Mr. Britten had translated them on to the full-sized scale. Mr. Watts's one cartoon hangs in the trophy room, a chamber in one of the galleries, so-called because after the Duke of Wellington's funeral the mass of colours and banners used in the church was stored here. In some ways it has been judged a pity that Stevens's design was not pursued throughout, and that he was not permitted to do it; but the poor man did not even live to finish the Wellington Monument.

Next in date to his model came a pair of very gorgeous ones submitted in competition by Mr. Burges and Mr. Penrose, with a series of paintings for the dome. It is interesting to notice that Mr. Burges wished to case the whole interior of the cathedral with marble. Apart from the gigantic expense involved, it would certainly have altered the proportions.

Sir Edward Poynter's is the next model, also with paintings, both quarter and full scale, and in competition with his a model by Mr. Stannus. Last is the model showing Sir William Richmond's scheme, which was adopted. These models are all most delicately and elaborately made, and painted in colours and gold; they show in some cases rich designs for a reredos which were never carried out, an erection on the baldachin pattern, recalling that of St. Peter's at Rome, with which St. Paul's is so often compared. It seems rather a waste to store these instructive relics in a lumber-room which is never traversed except by workmen; and, when the decoration work is completed, one may hope that they will be brought out and placed in some historical collection.—(Extracts from an article by Mr. H. C. Marillier in the "Pall Mall Magazine.")

MUNICIPAL HOUSE-BUILDING.

The Ills of the Glasgow Corporation.

IN the twelfth of the series of articles on "Municipal Socialism" now appearing in the "Times"—a series which has attracted so much attention—the writer deals with municipal house-building in Glasgow. The following are extracts:—

Under the Glasgow Improvements Act of 1866 the City Corporation acquired possession of slum areas extending over 88 acres, and occupied by a population of 51,000 persons, the cost of the scheduled properties being about £2,000,000. Clearances were effected, new streets were formed, and it was hoped that the vacant land would be taken up by builders and turned to account by them. A substantial portion of the land was disposed of to builders on chief rent or feu duty of a capital value of about £300.000. But the charges imposed by the Corporation were very high, and the fact that such extensive clearances had been made, and the former population scattered to other districts, led to there being only a limited demand for shops and houses at that time, so that several of the builders lost very heavily by their speculation. Others were deterred from running the risk of sharing their experiences; and as the Corporation declined to reduce the charges for sites, so as to give to the builders a reasonable chance of a fair return on outlay, the remainder of the land was left on their hands until 1888, when they resolved to carry out a building scheme on their own account. They then proceeded to put up a considerable number of shops and dwelling-houses, seven large lodging-houses, a laundry and a family home, the total value of the property thus erected by them being about £1,000,000. To meet the cost of carrying out their improvement scheme the Corporation had levied on the rental value of the city a rate which was fixed at 6d. in the £ for the first year, 4d. in the £ for the next four years, with subsequent reductions until 1d. in the £ was reached, at which figure it stood until it was finally abandoned in 1888. The charge on the rates thus extended over a period of more than twenty years and the total amount actually contributed by the ratepayers has been put at £600,000.

In return for this expenditure the city gained what was undoubtedly a very great improvement in the disappearance of many narrow streets, filthy courts and insanitary and overcrowded dwellings, and the substitution for them of new and broadened thoroughfares, with healthy dwellings, shops, &c. But there was no suggestion of any

attempt to re-house the people who had been ejected from the demolished areas, the new dwellings being, as a rule, such as only well-to-do artisans, Corporation officials, clerks, shopkeepers or professional men could afford to rent. . . .

So serious was the state of things brought about by the Corporation's pulling down the poorest class of houses without making any provision for the poorest class of people that in 1890 the Glasgow Workmen's Dwellings Company, Ltd., was formed by certain prominent citizens, with a capital of about £40,000, not with the idea of curing the evil with such very modest means but in the hope of affording some "object-lessons" alike in the building of "simple, sound houses" capable of being let at minimum rents and in improving the structure and the management of dilapidated slums so as to convert them into habitable and remunerative dwellings, instead of demolishing them altogether. . . . In any case the direct result of the policy carried out by the Glasgow Corporation in regard to the housing question has been to check the further development of local private enterprise along the lines laid down by the Workmen's Dwellings Co. Professor Smart says of that company: "It has built to the limit of its capital. It could raise more capital, or it could start other companies. But it stays its hand for two very good reasons—(1) because it cannot afford to rent at cost; and (2) because, even if it were willing to, there is no use in private people losing money to do what the Corporation is going to do presumably without losing money." . . . One feels, indeed, that the Glasgow Workmen's Dwellings Co. has really done more in its way towards the solution of the real housing problem than the Glasgow Corporation with all the funds at their command.

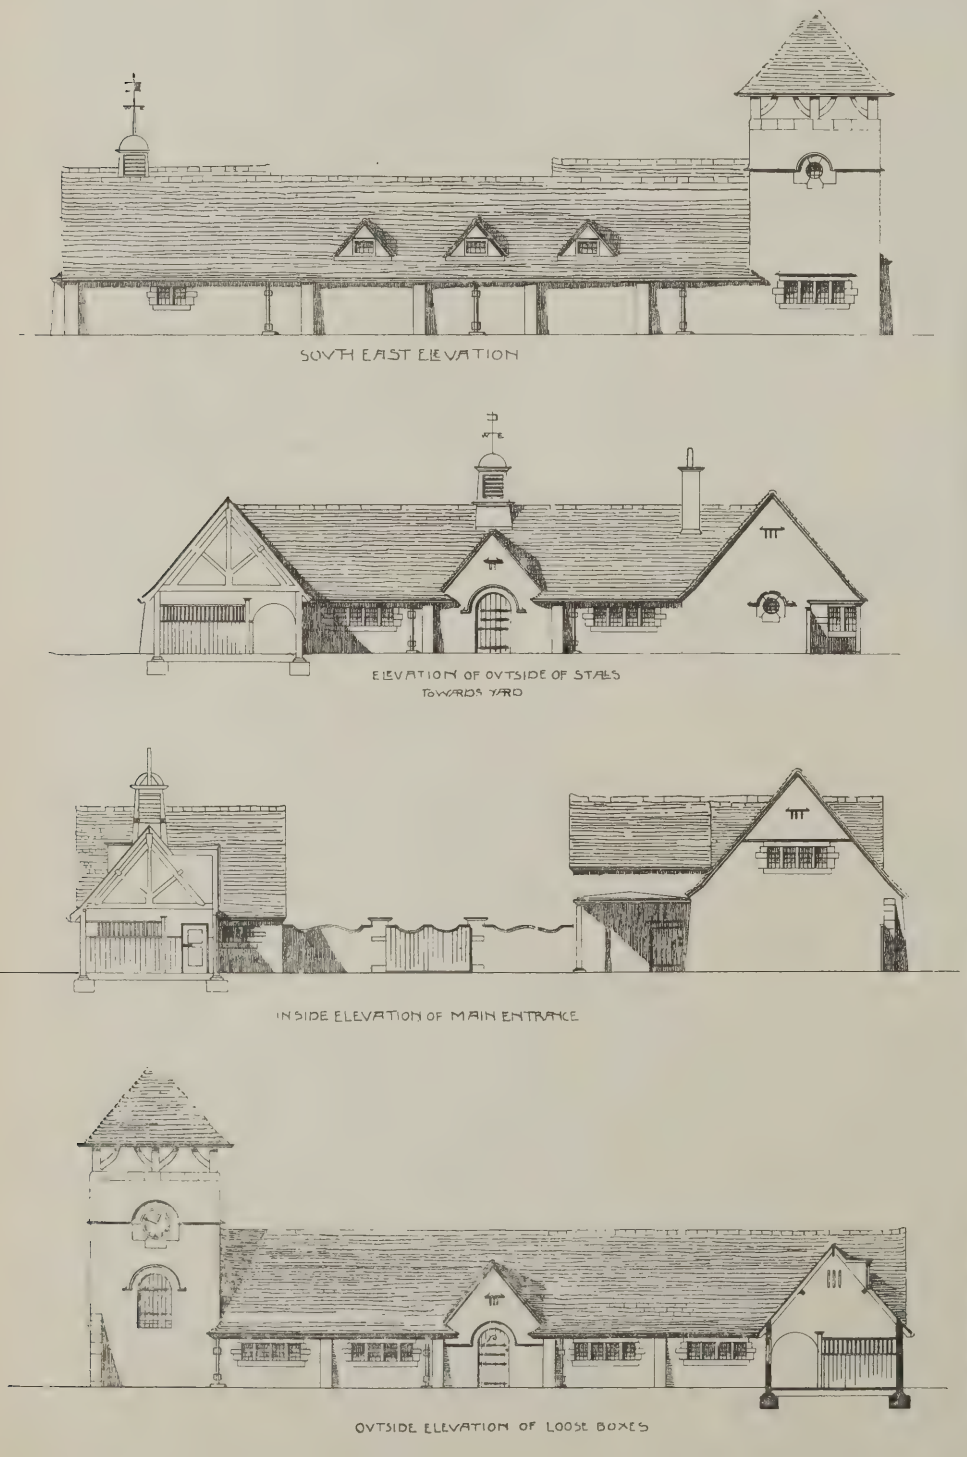
[An illustrated article on the Company's work appeared in the BUILDERS' JOURNAL for October 9th, 1901.]

The Stable by Mr. Voysey at Kingsbury, Middlesex, shown by the accompanying illustrations, is proposed to be built at "The Cottage," for Mr. L. Mieville. It will be in brick, rough-cast, with hand-made red tiles on the roofs and oak joinery throughout. The paving will be in yellow brick, and all modern metal castings will be carefully avoided.

"Cisterns and Tanks."—In the review of this book published in our last issue it was stated that copies may be obtained from the author, Professor Adams, at 60, Victoria Street, E.C. The address should have been given as 60, *Queen* Victoria Street, E.C.

PNEUMATIC DRAINAGE.

The new French System at Stansted.



AN installation of pneumatic drainage has just been completed at Stansted, Essex, the first of its kind in this country. The system is a French one for draining by suction districts which cannot be drained by gravitation. At Stansted the district is very hilly, and the drainage of the lower portion of the parish has given a lot of trouble to the local sanitary authority for a long time past. The Local Government Board, however, would not sanction a loan upon this pneumatic system of drainage until they had seen it in operation for two years, so in order to introduce it into this country and get the Local Government Board's approval the Liernur English Syndicate agreed to bear the whole of the cost of laying down the installation and to work it for two years on the understanding that if at the end of that time it gave satisfaction the Stansted Council would take it over at a figure agreed upon, which is less than the cost price.

Mr. Liernur explained to those present at the recent opening ceremony that from the central pumping station were laid cast-iron pipes leading to the streets drained. A vacuum was created by means of an air-pump, and the whole of the sewage was brought along the pipes by suction to the station without the addition of any flushing water. By this suction they got a velocity in their sewers of from 12ft. to 20ft. per second, instead of 2ft. or 3ft. per second as was the case in ordinary gravitation. The system had very great advantages, inasmuch as stoppages were absolutely impossible, and it enabled them to do without manholes, inspection chambers, flushing gulleys, &c., which resulted in great economy in construction and in working. The population of that portion of Stansted drained by this system was between 750 and 800, and the whole time taken in conveying the sewage from the syphons to the pumping station was only ten minutes.

In reply to Sir James Blyth, Mr. Liernur said the quantity of sewage dealt with at Stansted was from 7 gals. to 10 gals. per head of population per day, but apart from this they had a quantity of industrial effluent from the Mica Insulator Factory and the brewery. Further questioned, Mr. Liernur said they took in no storm water; it was dealt with by a separate sewer. The house traps were emptied once a day. They were not ordinary traps, but overflow syphons which were emptied automatically. The sewage all went by gravitation to a certain point, whence it was brought on to the pumping station by suction and then pumped on to the land about 40ft. higher for irrigation purposes. The working cost of the scheme was only about 1s. per head of population per year.

At a luncheon which followed, Sir John Blyth said he understood that Trouville was the town in France where this novel system had been successfully put to the test, and he sincerely trusted that Stansted might prove to be the Trouville of England. By laying out this scheme within easy reach of London other reformers could inspect what they were doing and could follow the example; and he might add that any assistance he could render to the residents living in other parts to visit Stansted and inspect these works would be a duty and a pleasure to him.

Mr. E. T. Watts, the surveyor to the Council, who has superintended the work, said that when the scheme was first brought forward he regarded it somewhat timidly, thinking it was a very complicated one, but the more he looked into it the simpler it became. He found that the difficulties which at first presented themselves were only imaginary, and at last he was able to recommend his Council to adopt it. Now that they had adopted it he felt he must do all he could to further it. There were many of his colleagues present who suffered very much from dealing with sewage of unknown quantities when there were heavy storms. In the Liernur system that difficulty was entirely done away with. They only admitted and dealt with that sewage which they wanted to deal with. Surface water was allowed to go into the brooks. The more they could diminish the quantity of sewage the less they had to deal with at the other end. From careful investigations he had made he found that the sewage at Stansted did not amount to 10 gals. per head per day, and when they got the people to realise what a system they had the amount they would have to deal with would be still less. He might add that all the gentlemen who were upon the English Syndicate were Englishmen, and the material used had all been supplied by English workmen.

PROPOSED STABLE AT KINGSBURY, MIDDLESEX. C. F. A. VOYSEY, ARCHITECT.

The new St. Peter's Church at Ilfracombe is being erected at a cost of £6,000, in Highfield Road. It will be built with pink limestone facings, with Bath stone quoins, all the windows, doors, jambs and string-courses, inside and out, being of Corsham Down stone. The inside facings are to be of dressed ashlar from Hangman, Combemartin, the floors being of wood blocks, with tiled aisles. The roofs are to be open in construction and covered with red tiles. The plan of the new church shows a broad nave, 84ft. by 24ft., chancel 34ft. 6in. by 21ft. 6in., chapel 17ft. by 10ft. 3in., two transepts 35ft. by 15ft. each, two aisles 48ft. by 10ft. each, giving seating accommodation for about 700 persons. Mr. G. H. Fellowes Prynne is the architect and Mr. Pickett the builder.

Views and Reviews.

The British School at Rome.

In the spring of 1901 the newly-formed British School began its work at Rome, and this volume is the first of its publications. The School is similar to that at Athens—indeed, it is the intention to place the two Schools under one joint committee. The first and chief of the two monographs which make up this volume deals with the church of S. Maria Antiqua, and is written by Mr. Rushforth, the director of the School. The space between the vast brick structure known as the Temple of Augustus and the steep north-west face of the Palatine hill is filled up by a building which after sundry uses became converted into the church of S. Maria at some time after the middle of the sixth century; but suggestive though it may be of structural developments and changes in planning, its main interest lies in the paintings with which it was decorated. The history of the seventh and eighth centuries in Rome is very meagre, and this church is valuable as revealing the system on which the decorations were carried out, and thus "the interests and tendencies of the Romans of those days, their standards of art and the kind of pictures they were accustomed to see, their dress and personal appearance, their manner of burial, have been brought home to us more vividly than they had ever been previously." The church was abandoned when, in 847, Rome suffered from an earthquake of much severity, but it was the fire of 1084, made by the incoming Normans, that effected its final burial.

S. Maria was not a church of importance and consequently there would be no special Greek artists from Constantinople to decorate it with mosaics. Greek indeed its wall paintings are—or Byzantine as we chose to call them—but they have a local feeling which is due to a transplantation and a fresh artistic impulse. The church was decorated in every part—its outer hall, its inner cloistered court, its corridors—and though it seems necessary that the building should have been roofed in, if this had been so it is difficult to imagine how it could have been lighted. The paintings themselves depict, of course, various saints and martyrs, and Biblical events; and remembering the customs of the early artists, it is not surprising to notice that Noah and the aged Jacob are fully draped in the classical style, while youthful and inferior persons have a short tunic and hose with a red stripe down the front of each leg.

Adjoining the church proper is the Chapel of the Forty Martyrs, on the walls of which are represented the forty men who endured exposure in an Armenian lake, not, however, according to the legend, surrounded by ice, but standing up to their knees in water, with one member (whose courage failed him) stepping out into a tent, though the legend says it was a warm bath! This, however, is common with the period.

Mr. Rushforth describes all the paintings in detail, but it is much to be regretted that no illustrations of them could be given: and though this is due to the fact that the Italian authorities preclude such publication until the official account has been issued, it would perhaps have been better to wait till this had been done.

The second part of the volume, by Mr. Ashby, possesses, as observed in the preface, "an importance of its own as a contribution to the task of reconstructing the Roman Campagna as it was before desolation and silence fell upon it": its interest, however, is in its detail, which cannot here be gone into.

On the whole we must congratulate the School for having issued so valuable a book, and also the publishers for having produced it so admirably, the printing, paper and type being excellent.

"Papers of the British School at Rome." Vol. I. London: Macmillan & Co., Ltd.

The Egyptian.

There can be no "review" of a book like this. It is an illustrated statement of excavations made under the direction of the greatest living Egyptologist, to whose patient and wonderfully discriminating researches we are indebted for so much of our knowledge of ancient Egypt; and the book being such a statement, one can do no better than give a brief account of the facts it sets forth. This twenty-second memoir, then, of the Egypt Exploration Fund completes the account of the objects found in the Royal Tombs of the earliest dynasties and covers nearly all that has been found in the Temenos of Osiris. Professor Petrie has had the same gang of men and boys as have excavated for him during many years—indeed, these have formed a nucleus for all other recent excavators; but it is found necessary to be continually weeding out the old hands, because the Egyptian always becomes spoiled by prosperity. The work of directing such excavations as these in Egypt not only requires vast and precise knowledge, but entails a great amount of account keeping, for the season's work involves about 40,000 entries of small sums! Notwithstanding this, however, Professor Petrie has managed to draw thirty-seven of the plates and take all the photographs that illustrate this memoir; and his wife has made drawings of nearly four hundred of the flints discovered, with all their facets and broken outline—a most tedious task—as well as facsimile copies of inscriptions; Mr. Arthur Weigall having superintended the men at the great southern tombs and Mr. A. St. G. Caulfeild those at the Sety temple, while Mr. Laurence Christie has carried out some of the copying work.

These the workers: we may now deal with the work. First, then, at the Royal Tombs hundreds of fragments of pottery jars were found, on which were written, in ink with a brush, inscriptions of two formulæ, one a king's, and the other his queen's; and these are the oldest hieroglyphic inscriptions known, for they probably date half-way back in the dynasty before Mena, that is, nearly 5,000 years before Christ. To the other discoveries in these Royal Tombs we need not now refer, for it will suffice to say that they chiefly enable the ten early kings who reigned at Abydos to be restored. The Temenos of Osiris is more to our purpose. We may read its history like one of our own churches, of which we speak that it was founded before the Conqueror, and added to by this man, with a tower by this prelate, and so on. Thus, then, the history of this ancient relic of Egypt:—On the sandy edge of the desert a temple of Osiris stood presumably before the First Dynasty, and around it sprang up a town which was afterwards walled in. Then in the Eleventh Dynasty Antef V. rebuilt the temple with octagonal columns of limestone; in the following Dynasty many monuments were added; in the next, Sebekhotep III. built a black granite gateway; in the Eighteenth Dynasty Tahutmes III. built a massive inner wall, more than 20ft. thick, with a great red granite pylon on the desert side; and so on through the following Dynasties. Thus the history unfolds itself, though the temple site has not been cleared below the foundations of the Eighteenth Dynasty, the work being rendered very difficult owing to the rising of the Nile. Outside the temple not a trace of any building of the early time was found except mud brick houses, and the excavators have to deal with what was a series of towns piled up in strata between 6in. and 1ft. thick. In these strata many objects have been found, but it is not within our scope to deal with them.

The Osiris temple consists of two chief parts, a square building of which nothing but foundations and loose blocks remain, and a second part having still the lower few feet of the walls of two pillared halls and some chambers. Many of the fragments of columns, granite sculptures and other objects found have been sent to the Cairo Museum, but a large lintel of Tahutmes III. still in a bright condition of colouring was sent to the Boston Museum.

The most unexpected result of the year's work was the discovery of a high style of limestone sculpture under the reign of Nectanebo I. which preserves the traditions of the Eighteenth Dynasty almost unchanged and shows no trace whatever of the surrounding influences of Greek art.

On the south side of the valley which leads up to the Royal Tombs a spur of the desert runs forward between the Temenos of Osiris and the great temples of the Nineteenth Dynasty. The whole surface of this hill, for about half a mile back, is honeycombed with tombs. Those near the desert edge are so close together, and have been so completely wrecked by Mariette's plunderers, that Professor Petrie and his co-workers have not attempted to do anything with them; but in other parts they have made considerable finds, dealt with in chapter iv. of this memoir.

It is, of course, impossible to adequately set forth in words what the many fragments are like, but the memoir is so fully and carefully illustrated—in fact, the letterpress is merely supplementary to the plates—that it forms a most important link in this chain of Egyptian history now being pieced together under such diligent hands. There are, however, many links missing, and it is to find these that the Egypt Exploration Fund continues to devote itself.

"Abydos: Part I., 1902," by W. M. Flinders Petrie, with a chapter by A. E. Weigall. London: Egypt Exploration Fund, 37, Great Russell Square, W.C.

Mitchell's Building Construction.

A new edition of the Elementary Stage of Mitchell's "Building Construction" has just been published. It is a very great improvement on former editions. Many new illustrations are added and the text has been revised and considerably enlarged. We are glad to see that Mr. Mitchell has given more reasons for the forms usually adopted in building construction, as this is the common stumbling block of students, so that if they can only clearly understand the why and wherefore of things their interest is awakened and original thought is encouraged. We should like, however, to see some further explanation of the reason for using headers in footings on p. 33. Of course the best instruction is to be found in actual building works, on which the student should spend most of his time for study, but a book such as this is of inestimable use as a memorandum, and as suggesting objects for study and reasons for their forms. Mitchell's "Building Construction" is undoubtedly the best work a student can obtain on elementary construction. The illustrations now number more than a thousand, and are most clearly drawn. The price is wonderfully low.

"Building Construction and Drawing: First Stage or Elementary Course," by Charles F. Mitchell and George A. Mitchell. London: B. T. Batsford, 94, High Holborn, W.C. Price 3s.

At the Woodbury Gallery, 37, New Bond Street, W., the members of the Guild of Handicraft will open an exhibition on October 13th. Thanks to Mr. C. R. Ashbee, the Guild has made much progress during the last few years, and the public will doubtless be glad of the opportunity to see a collection of its work. The exhibition will include examples of gold and silver work, jewellery, enamels, furniture, book-bindings, woodcuts, pieces of fine smithing and casting, electric lights, &c.

Surveying & Sanitation.

Old Drains and Water Tests.—At the annual meeting of the Sanitary Inspectors' Association, held on Saturday night, the chairman of Council, Mr. W. W. Wilkinson, announced that the Council had that day discussed a matter which all sanitary inspectors must regard as of serious importance. In an action brought by a local authority against a metropolitan dwellings company for a contravention of the law, the principal witness for the defendant, Dr. Wynter Blyth, in giving as his opinion that it was unreasonable to expect an old drain to stand the water test, stated that he was the chairman of the Council of the Sanitary Institute, this statement from one holding so prominent a position having so much weight with the magistrate that he dismissed the case. The Council strongly protested against this, and passed a resolution urging the Sanitary Institute to dissociate itself from any implied concurrence in this statement.

Oiling Roads.—The use of petroleum to lay the dust and consolidate roads was first tried at Baku, the source of supply of the Russian kerosine. Baku is situated on an arid tract of land in the Apcheron Peninsula, upon the shores of the Caspian Sea, and was until recently without any proper water-supply, as there is no river in its immediate neighbourhood. The Caspian is much salter than the ocean, and when its water was used for street watering there was too great a deposit of salt in the streets. Fresh water was too expensive for the purpose, as the potable supply had to be brought in carts, from some distance, and although there were some 200 miles of petroleum pipes in the town and neighbourhood there were no water pipes. Crude petroleum at the period in question was worth two or three annas per ton, but it was two dangerous a liquid for street watering, as it contained volatile constituents that would ignite readily; it had also a strong and disagreeable smell. The liquid used was *astatki*, or the residue of the stills, which was also used as fuel in boilers. This residue is a thickish dark-coloured oil, having a very faint smell; its value at the time of the experiment was about 2s. per ton, and it was applied to a road whose surface was of coarse sand which it tended to consolidate. This road ran along by the harbour, and did not appear to be of a nature to bear sweeping; the oil therefore effectually laid the dust, and is said to have effectually resisted the rain of the winter season.

Engineering Notes.

Richmond Bridge is so inadequate that it is proposed to build a new bridge, either on its site or elsewhere.

Electric Railways at Stourbridge have been constructed. The lines will serve as feeders of the existing light railways of the Dudley, Stourbridge and District Electric Traction Company, which now owns between twenty and thirty miles of local tramways.

The Withington New Sanatorium, near Manchester, has been supplied by Messrs. E. H. Shorland & Brother, of Manchester, with their patent double-fronted Manchester stoves in glazed faïence and with descending smoke flues, and patent Manchester grates with faïence chimney-pieces.

A new Bridge at Hull was opened last week connecting the eastern portion of the city with the west, over the River Hull. The bridge is a bascule one, constructed in three spans; the central opening through which ships will pass has a span of 51ft., and the two side spans of 19ft. each. The bridge is constructed mainly of steel. The cost has been about £33,000.

Swansea New Docks.—A new lock is being constructed at the South Dock which will provide accommodation for larger vessels than formerly. The cost of the scheme has been £100,000.

Messrs. Andrew Handyside & Co., Ltd., steel bridge, roof and structure makers, of Derby, have secured the contract for the extension of Messrs. Leys Malleable Casting Works, Derby.

Garden Cities Engineering.—The Civil and Mechanical Engineers' Society held a meeting last week, when Mr. Ebenezer Howard read a paper on "Some Engineering Features of the Garden City Scheme." Describing an ideal garden city as one capable of providing for a population of about 30,000 persons with an acreage of about 5,000 in the city proper, Mr. Howard drew attention to plans providing for a central garden and circular roads extending to about a mile and a half in circumference. For this population, water, sewage and electricity for both lighting and power purposes could easily be arranged, and all these advantages, adding telephone communication, could be supplied with a minimum of local rating. The scheme was one presenting no engineering difficulties, and was, he claimed, one which would solve the problem of placing the town population amid rural surroundings, and with all the advantages of the latter. A discussion followed, in the course of which the economic rather than the engineering difficulties were referred to. In reply, Mr. Howard pointed to the model towns erected by the Messrs. Lever, Cadbury and others as practical evidence of the feasibility of his scheme.

Masters and Men.

Labour in the Colonies.—The October Circulars of the Emigrants' Information Office, 31, Broadway, Westminster, S.W., show the present prospects of emigration. In Canada work was plentiful during the summer both in the agricultural and manufacturing industries, but it is too late for emigrants to go there this year, unless they go to friends or have means of their own. In New South Wales, the building trade at Sydney continues busy, and there has been a demand for skilled plumbers, but all other trades are depressed. Country districts are suffering most from the severe drought. In Victoria there is no general demand for more labour, and many men are out of work. No large public works are being proposed by Government which might provide employment. The drought has long pressed heavily on large portions of the State, but useful rains have lately fallen. In South Australia the chief industries are connected with mining, farming and manufacturing, but there is no demand for more labour at the present time. In the north of Queensland there is a slight demand for general labourers; in the central districts there is practically no demand for anyone; and in the south there is a good demand for general labourers only. In Western Australia there is ample supply of men in the building and other trades at Fremantle, Coolgardie, Albany and other towns, but there is a demand for them in one or two small places, as Menzies and Northam. In New Zealand there is a good opening for a limited number of mechanics, but not for general labourers; passages at reduced rates are given to persons possessing fixed incomes, or a little capital. In Cape Colony there is no demand for more mechanics. No one is now allowed to land in Natal without a permit. This must be applied for personally at the Permit Office, 47, Victoria Street, London, S.W. The applicant must possess £100, or prove that he is in a position to maintain himself in South Africa. There is now no special demand for more artisans, a large number of carpenters and others in the building trades having lately arrived, but skilled men can find work. Permits are required by those going to the Transvaal and the Orange River Colony. These will not be valid unless endorsed by the representatives of those Colonies at the port of disembarkation. There is a fair demand on the Rand for really first-class mechanics in the building trades at an average wage of a little more than £1 a day; but the market is limited, and emigrants must remember that the cost of living is at least double that in England, rent being especially high.

Builders' Notes.

Mr. E. Carpenter has been appointed clerk of the works at the Royal Courts of Justice in succession to Mr. R. Phillips, recently transferred to Buckingham Palace.

Harrogate Building Trades Exchange.—The members of the various businesses connected with the building trades of Harrogate and district have secured conveniently situated rooms in the Central Arcade, Chapel Street, on a lease, and have established a Building Trades' Exchange and Club, which was opened last Saturday week. One of the principal objects has been to have a suitable meeting-place for the members to have business and social intercourse, and the club is to be run on similar lines to the one at Halifax. The suite includes large billiard-room, smoke-room, reading- and committee-rooms, and stewards' rooms.

Hamilton By-laws.—A special meeting of the Town Council was held last week to consider a motion relating to a building difficulty which has been a subject of controversy for some time, and which has wellnigh brought building operations within the burgh to a deadlock. The motion set forth "that, considering the effect of the resolution of Town Council of date 12th August last to enforce clause 12 of schedule 4 of the Burgh Police (Scotland) Act, 1892, it be a recommendation to the Dean of Guild Court to take the necessary steps to have the said clause amended so as to permit them to grant linings for the erection of buildings where the thickness of walls on the outside or house side of the chimneys be not less than 4½in., and to make regulations thereanent." After considerable discussion, it was agreed to recommend the Dean of Guild Court to apply to the sheriff for an alteration of the regulations so as to ensure that the buildings in the case of brick be not less than 4½in. and of stone 6in.

Registration of Plumbers.—An influential gathering of gentlemen interested in the promotion of the public health by securing good plumbing work was held last week at the Fishmongers' Hall, London Bridge, under the auspices of the Worshipful Company of Plumbers. Baillie Crawford, of Glasgow, the Warden of the Company, presided. Sir James Crichton-Browne expressed his entire appreciation of the labours of the Plumbers' Company to secure good and efficient plumbing, remarking that nowadays the plumbers' pipes ran beneath a house like a kind of macaroni dressing. Referring to the efforts of the medical profession to destroy the tuberculosis bacillus, Sir James reminded those present that bad plumbing, damp-houses and mildew were active agents in the spread of the dread disease. Mr. Gomme, alluding to the by-laws which the County Council had made on the subject, said that those laws could only be properly carried out by a registered plumber. The Council did not say that they must be so carried out by a registered man, but he was sure that they could only be carried out by a thorough and efficient workman.

Bricks and Mortar.

Aphorism for the Week.

Exclusive of the abstract sciences, the largest and worthiest portion of our knowledge consists of aphorisms, and the greatest and best of men is but an aphorism.—COLERIDGE.

Our Plates. THE garden-house at Walmer Lodge, Deal, was built for Mr. Albert Ochs, and is situated at the end of a long pergola walk, part of which is shown in our illustration. The brick walls are covered with rough-cast, and the facings and columns are of freestone.—The pupil teachers' centre in Offord Road, N., has been erected by the School Board for London from the designs of their architect, Mr. T. J. Bailey, F.R.I.B.A., and is now in full operation. The accommodation is for 312 mixed students, and consists, on the lower floor, of ample covered playgrounds, luncheon-room, kitchen, &c. On the ground-floor are four classrooms, an assembly-hall, lavatory,

PUPIL TEACHERS' SCHOOL, OFFORD ROAD, BARNSBURY, N.
T. J. BAILEY, F.R.I.B.A., ARCHITECT.

cloakrooms, &c; teachers' rooms being placed on the mezzanine floors. On the first floor are four classrooms, intended gymnasium, dressing-room, cloaks, &c.; and on the upper or second floor drawing class-room, chemical and physical laboratory, lecture- and modelling-rooms, &c The building is lighted by electric current, and is warmed by low-pressure hot-water apparatus. The elevation is of red-brick facings, with terra-cotta dressings. The drawing was exhibited in the Royal Academy Exhibition.—The offices in Grenade Street are now being erected by Messrs. Clark, Williams & Co., ship joiners and timber merchants, to take the place of the older offices and board-room at the rear of the site, hereafter to be pulled down. The work is being carried out by the firm, all the woodwork being prepared in the shops on the premises. There will be no plastering in the interior, the chimney breasts being built with facings of enamelled and salt-glazed bricks, all ceilings, partitions, &c., being in exposed and wrought wood-framing. The board-room at the back is lit solely by a lantern in timber framing in which panels of Oregon pine take the place of plaster fillings. The walls of this room will be panelled up to the spring of the roof, the fireplace recess being finished in green enamel tiles and bricks. Mr. Arthur T. Bolton, of 2, The Sanctuary, S.W., is the architect.

The Indian Coronation Casket. THE Coronation casket which has been presented by the city of Madras to the King Emperor takes the form of the famous Padu Mandapam, in Madura, which was erected by King Tirumalai as a guest house for the god Siva, who agreed to pay an annual visit to the place provided a suitable building were erected for his reception. The facade of the building is covered with the most wonderfully-executed groups of warriors, horses, lions, elephants and tigers. These are beautifully reproduced in the silver casket. The dimensions of the casket are: height 20in., length 17in., breadth 8in. It is surmounted by three silver and gilt gopurams, the centre one being higher and more imposing than the others. Running round the base of the building is a fantastic scroll with bhoots in pairs over a floral scroll. Ancient warriors are embossed in panels below the gopurams. The four corners of the buildings are adorned with Yalis, or extinct animals. The base on which the casket stands is of carved ebony. There are six panels in front and an equal number behind, flanked by three panels on each side. The ebony panels are relieved by silver Ghandarvas, with vinas in high relief. The whole is supported by eight ancient winged war horses in silver. The casket, which was manufactured in six weeks by Messrs. Framjee P. Bhumgara, cost Rs.5·500.

Netley Hospital. WHEN the military commission which has been entrusted with the reorganisation of Netley Hospital has finished its labours in reforming the medical side of the institution, it may be taken for granted that the work of remodelling the building itself will be taken in hand. It is now generally admitted that Netley is in an insanitary condition, and that medical structural alterations are needed to bring it into line with modern medical and nursing requirements. The broad passages, which run the length of the building, and the spacious wards, are excellent from the point of view of ventilation, but the windy corridors facilitate the carrying of microbes from one part of the building to another, and the size of the wards makes the isolation of infectious cases almost impossible. When the new Alexandra Hospital, to be built on Portsdown Hill, near Portsmouth, is completed, the pressure on Netley will be removed, and the authorities will be able to carry out the much-needed reforms.

Oundle Church. OUNDLE CHURCH stands well in the centre of the town, and is of more interest externally than internally. Its chief features are the square tower with tall crocheted spire. A sketch of the south porch of this tower is given on this page. The lectern is interesting, as it is said to have been found in the river bed at Fotheringhay, about three miles distant.

Liverpool Cathedral. THE Petition Committee point out that although 1,000 guineas are being paid to the advisory architects for their opinion (which is subservient to that of the cathedral executive committee) only 1,500 guineas are being paid to competing architects for five designs for a cathedral to cost £1,000,000 (representing £5,000,000 worth of architects' services, the scale charge for which would be about £125,000); that even after all this ill-paid skill and labour have been expended by the five selected architects, the cathedral executive committee are at liberty to invite and adopt the designs of other architects who have not incurred the expense and trouble of the first competition; and that in consequence of all these unsatisfactory conditions, it seems quite improbable that the best possible design for a cathedral will be forthcoming.

The Rossetti Window. The "Rossetti Window" in Birchington Church, which, as we reported last week, was damaged recently by a burglar, was placed there in 1884. It was the work of Mr. Frederick Shields, and was executed by Heaton, Butler & Bayne. The window is of two lights, one containing an adaptation by Mr. Shields of Rossetti's design "The Passover," which was a commission from Ruskin in 1855-6 and was exhibited at the Royal Academy in 1883. The original intention was to use the "Christ in the House of Simon the Pharisee" for this purpose, but the church authorities objected on the curious ground that the "incident was not in Scripture." The subject of the design, by Mr. Shields himself, which fills the other light is

DRAWN BY HEATON COMYN, A.R.I.B.A.

the "Healing of the Blind Man." The limitations as to the subjects of stained glass imposed by the clergy of Birchington are not insisted on in a certain church in Norfolk, which possesses a window showing a full-length and realistically-treated portrait of a lady painting at an easel.

St. Cleer Church.

The parish church of St. Cleer has a granite tower 97ft. high, erected at a later date than the church, but corresponding with the south aisle in style of architecture. The church consists of a nave, north and south aisles and a chancel. The north aisle is the oldest part of the building. At the north-west corner of this aisle is a Norman doorway. The windows of the aisle are modern, and differ from each other in pattern, The pillars and arches which separate it from the nave are of local stone. Those which separate the south aisle from the nave are much more elaborate, and are of Polyphant stone. They are quite unique, and there is nothing to equal them in any of the neighbouring churches. The chancel is very plain, and it is proposed to decorate it. On the walls are several texts, on wood, which are very rarely found in churches at the present time, and are really no ornament, and, with the seats, will probably soon disappear in the proposed scheme of restoration. On the floors are indications that brasses were once there and have been removed, and there are no monuments previous to the reformation. The church was dedicated to St. Clarus, a bishop who died A.D. 874, and of whom there is a representation in one of the stained-glass windows of the church of St. Neot's. The cost of the restoration to be first attempted is about £1,300.

West Dereham Church.

The parish church of St. Andrew, West Dereham, the nave of which was re-opened for divine service recently, after restoration, is a building which possesses many points of peculiar interest. The ancient round tower, of unusually large dimension, is supposed to have been one-third higher than the present structure, which may account for the octagonal capping of brick, evidently of a much later period, and supplying the place of the lost portions of the circular base. The tracery of the four windows of the nave is remarkably fine, but much worn with age, and to some extent damaged by the fall of the roof about a year and a half ago. There is a fine chancel arch in the Perpendicular style. There are costly monuments in the chancel. The nave through the falling of the roofs had become a complete wreck. The ancient roof, which was composed of very roughly hewn oak, was formerly covered with thatch. This, within the memory of some of the present inhabitants of the parish, was replaced by tiles of great weight, too heavy for the timber in its decayed state. It was found that the north wall had broken away extensively from the tower, and both the east and west gables required to be rebuilt. The floor of the nave was also in a very bad state, and interments appear to have been made very near the surface of the aisle—remains being found in some cases within 2ft. of the pavement. This has been remedied by a thick bed of concrete, upon which the present floor, of Staffordshire tiles and wood blocks, has been laid. A new roof in pitch-pine, the repair of the walls and gables, and the replastering of the nave, together with a new Porrit's stove, fixed in an underground chamber, form the extent of the present stage of the restoration of this fine old church. The work has been carried out by Mr. H. J. Green, of Norwich, as architect, and by Messrs. Tash & Langley as contractors.

A CHAIR OF CHICANERY.

IS ARCHITECTURE A TRADE?

IN a company of architects gathered in corporate capacity this question would be treated as an insult or as a bad joke. But while the architectural societies, as bodies corporate, would thus one and all answer the profane query by a contemptuous negative, and though the individual architect would invariably answer it to the same effect more or less indignantly, if deeds speak more loudly than words, the real reply of the profession generally is not quite so unanimous, after all, as the majority of its members would have the British public piously believe.

We will not name, in this connection, places and persons; but it has come to our knowledge that in a recent most important architectural competition in a certain North-country town the local firm of architects who, in conjunction with a City firm, pulled off the event, succeeded in eclipsing record; for while their less sophisticated local brother architects were toiling night after night, week in week out, preparing their competition drawings, this lucky firm gave out that they were not competing, and not only every member of their large staff of pupils and assistants but also one of the two active partners was quite unaware of anything to the contrary; so that when the local newspaper published the result of the competition, and congratuated the local firm of architects on having won by pure merit, thus honorably sustaining the architectural credit of their town, the astonishment with which the blushing recipients received this shower of press plaudits may be better imagined than described.

By what remarkable means had this odd result been achieved? It seems that the enterprising firm of City architects, having learnt from bitter experience the hopelessness of attempting to win competitions without wire-pulling, had succeeded in "doing a trade" with the senior partner of the local firm, for the attachment of the local firm's name to their plans. For reasons best known to himself the senior partner did not inform his junior or his staff. Hence the happy and quite unique denouement! In this case, who would say architecture was not a trade?

Into the muddy waters of such transactions honourable architects would not gain by probing, for the lessons in wire-pulling which they might learn would be such as they could not bring themselves to follow.

It may, however, be somewhat comforting to the clean-handed members of a noble profession to be assured that in the case here instanced, as in many not less dubious though less patent "deals," the deal as a trading transaction, and the design as an architectural achievement, are on a par, both belonging to that Sixth Order of Architecture, the *low* order for which the increasing familiarity of modern architects may breed, let us hope, a correspondingly growing contempt.

No one who has watched the development of the architectural profession throughout the latter half of the nineteenth century can fail to conclude that public competitions will become more and more, as the new century advances, the means of appointing architects to public works.

The modern student of architecture will search in vain the pages of Vitruvius or Chambers or Gwilt, and will ransack to no purpose the architectural libraries of Europe in quest of instruction in the science of wire-pulling and the tricks of trade.

If this science and these tricks must be known in order to pursue in this advanced state of society a successful career as an architect, ought not the Council of the Royal Institute of British Architects to forthwith establish at 9, Conduit Street a well-endowed handsomely-salaried Chair of Chicanery.

If the foregoing recent case of successful trading in architectural design were as exceptional in its character as in its accidental discovery, any such action by the R.I.B.A. would be premature at present. But the scandals of competitions seem to have reached an average of nearly 100 per cent.; so that immediate action of some kind seems needful to stem the flood of hypocrisy which threatens to overwhelm the few martyrs who still stubbornly stand for old-fashioned professional honour and rectitude in competition tournaments.

The tendency of the commercialism of these days is in architecture, as in other callings, to make the real expert the servant or slave of the clever exploiter.

But while the natural grouping of small industrial concerns under one big organisation undoubtedly economises the costs of production, and commends itself for many further reasons, that principle of grouping as applied to the architectural profession must have the effect of reducing the architect proper—the artist-engineer—to the role of a mere draughtsman of the great chief exploiter and wire-puller, who will, as this sort of process developes, become the bumptious boss of men superior to him in every endowment of mind and character, except in the science of chicane.

To institute at 9, Conduit Street a chair of chicane might have the effect of producing, in place of the present mixed crowd of honest martyrs and heyday hypocrites, a new school of architects versed in chicanery, taught to practice it, and making no bones about it.

Of course euphony would still claim consideration, and as "chicane chair" would be too much calling spade "spade," a less overt yet not inexpressive title might be "The Chair of *Savoir Faire*."

This would mean in effect the chair of *start fair*. All together! No martyrs, no hypocrites; but all chicaneers!

Cobwebs of scrupulousness, professional etiquette, honourable reserve and self-restraint, proper modesty, and all such hindrances to progress, swept aside; all decks cleared for action. Every architect going baldheaded and steel-hearted for all he is worth and for all the worth he can steal from his brother architects!

Lo! The vista of the trade of architecture through the twentieth century! The long-promised new style at last arrives! "The old order changeth." The five orders have gone. All hail to the sixth! All hail to the *Low Order*.

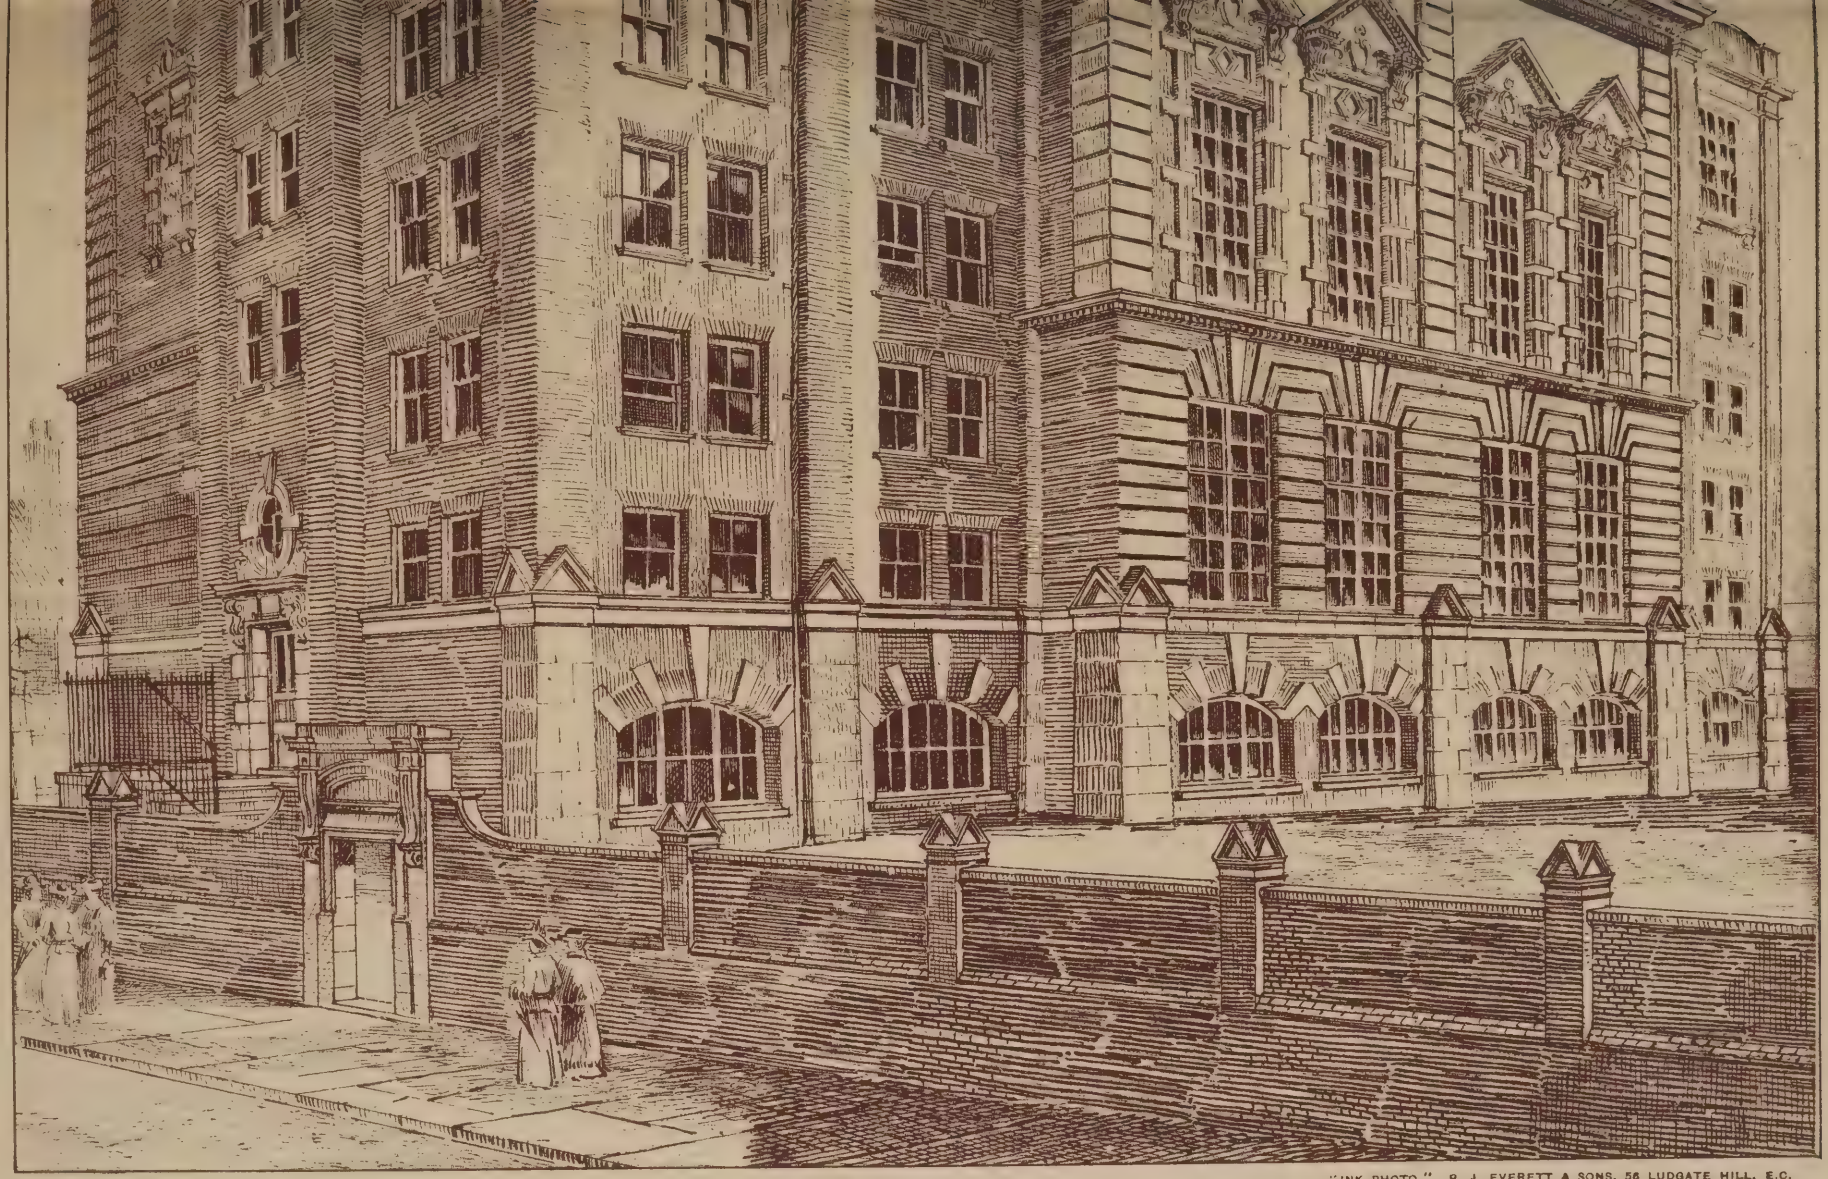
Langho Colony Competition.

To the Editor of THE BUILDERS' JOURNAL.

LONDON, E.C.

SIR,—In the notice of this competition in your issue for September 17th Mr. Dolby and myself are described as joint architects. This is incorrect. Mr. Dolby is co-author with myself in that he has acted as consulting engineer and prepared the schemes for heating, lighting and other engineering works, but as architect I only was responsible for the design.—Yours truly,



E. P. HOWARD, A.R.I.B.A.

"The Woodworker."—Vol. I. of this monthly publication has been issued by the publishers, Messrs. Dawbarn & Ward, Ltd., 6, Farringdon Avenue, E.C., price 3s. 6d. nett (postage 4d. extra). It contains practical illustrated articles on all kinds of woodwork.

THE ARCHITECTURAL ASSOCIATION.

President's Inaugural Address.

THE first sessional meeting of the Architectural Association was held on Friday evening at 9, Conduit Street, W., the chair being occupied by the new president, Mr. Henry T. Hare, F.R.I.B.A. Votes of thanks were accorded to the Royal Institute of British Architects for its annual contribution of £100 towards the expenses of the Association, and to Mr. H. Wilson for presenting a portfolio of drawings and designs by the late John Sedding. The following were then elected members:—Messrs. A. Bough, C. J. Graham and J. R. Sanders. A vote of thanks was accorded to the Bath Stone Firms, Ltd., for its courtesy on the occasion of the Association's visit to the Portland Quarries, after which the prizes were presented to the gentlemen named on p. 60 of our issue for September 10th last.

The president then delivered his inaugural address as follows:—

The first official duty your president is called upon to perform, that of addressing you at the opening of the session, is probably the most difficult and onerous of the many tasks which fall to his lot during his term of office. Time-honoured precedent, however, makes it impossible for him to avoid the duty, however much he might desire to do so, and it is a privilege not to be lightly set on one side. I therefore take up the burden, not so much in the hope that I may be able to say anything which has not been often and better said by my predecessors in the chair, but rather that I may give the necessary opening to what promises to be one of the most successful and important sessions which the Association has seen. What diffidence I may feel is dispelled by the testimony of your presence here to-night, which witnesses to the fact that this annual address is no mere formality. The responsibility, however, increases yearly, and expands as the work grows, and our interest in an engaging and delightful calling makes it well that we should thus annually meet to take stock, as it were, of our position; to review not only the past year, but the years which have gone beyond recall; to see how we stand, to look ahead into the future years, with whatever they may bring us; and, while taking council with each other, to encourage ourselves for the great and far-reaching object we have in hand, namely, the advancement of architecture, both as an art and a science.

The Formation of the Association.

About fifty-five years ago the Architectural Association, which was then in formation, met in a coffee house; afterwards in Lyons Inn Hall. The same burning zeal which inspired the founders is, I truly believe, still with us; the flame has in no way become dim; some of the founders are even still with us to-day, among them the venerable and esteemed Professor Kerr. From then till now is over an average life-time, and the Association is now a full-grown and vigorous body, meeting, by the courtesy of the Royal Institute of British Architects, in this their meeting room, our proceedings fully reported in an admirable professional press, and possessing a representative journal of its own production, not devoid, I venture to think, of literary merit.

We cordially welcome here to-night many old friends, while a still vaster number continue on our rolls, whose sympathy and support are essential to our well-being and progress. Their sons and successors are with us, working with a full and free hand, while, it may be, their grandsons are now in the Student Corps which our roll encloses. The Architectural Association is truly vernal. If you would renew your youth, I know of nothing likely to be so invigorating and stimulating as your attendance at one of our annual gatherings.

The labours of the Association have ever been of a self-denying character. In early days, and until within quite recent years, the new educational move, inaugurated by my distinguished predecessor in the chair, Leonard Stokes, the work of the Association was carried on by mutual self-help of an entirely honorary character. The services thus rendered gratuitously were of a high and valuable order, and many of us here to-night gratefully acknowledge our deep indebtedness for the valuable instruction thus imparted. But what was suitable for that time is wholly inadequate for to-day. Not that the conditions have so changed that we can dispense with the information of the past; but modern requirements are so exacting, and technical facilities offered by public bodies so great, that it became essential not only to bring our curriculum into line with those institutions, but to place the Association in such a position as to be able to be the head and fountain of architectural education in London.

The Establishing of the Studio

and the renting of the present premises in Great Marlborough Street was an enterprise viewed with fear and misgiving by many members. Those who pressed forward the scheme, fully believing it to be urgently necessary to meet the requirements of the time, may now, however, congratulate themselves on the success which has resulted, and on the benefits which the profession generally has derived from the facilities for study which have been afforded. Those who have passed through this course of training are only too ready to testify to the practical nature of the instruction they have received, and there is every reason to believe that the success of the past will be more than maintained in the future.

The general principle of the old classes of design is still maintained, in that the instruction or criticism is of a voluntary nature, conducted by a body of visitors specially invited, whose instruction is of the greatest value and advantage to the students attending the school of design. We are glad that this old and well-proved system still continues, and with such excellent results, in our Association work. We have not yet embarked upon the actual teaching of design in principle and practice, but that this must form a definite item in our programme of the future is not difficult to forcsee.

The Day School.

I am happy in having the privilege of recording the most successful result of the first year's work of our newly-established Day School, which is now in a flourishing and vigorous infancy. The formation of this involved a vast amount of time and thought on the part of my immediate predecessor in the chair, and its successful inauguration must be very gratifying to him. We have been most fortunate in securing as the master Mr. Arthur Bolton, to commence and complete the first year's course. To inspire enthusiasm into the new students, and to fully satisfy the intentions of a committee who were keeping their eyes upon the future of the school, must have taxed the best and most genial of men. Everything has dovetailed in a most admirable way, and the success of the first and somewhat experimental year augurs well for its long and growing influence.

The year's work has, however, demonstrated beyond all possibility of doubt the absolute necessity for other and more suitable premises. It needs no little skilful negotiation in our now very confined limits to make everything work with the smoothness so necessary in an educational institution. How difficult this is may be judged from the fact that the Day School hours are from 9.45 to 5 and the Evening School from 6.30 to 10. It is unnecessary for me to reiterate what has been stated so often from this chair—that the Committee are still on the look out for premises. I ask, however, for patience, fully expecting to be shortly able to make an announcement which, while fully meeting all our needs, will be gratifying to a degree to our members.

Ideals and Non-Ideals.

The object of the Architectural Association is to teach—in a measure—architecture, while its lofty aim is the improvement of the art. I do not by this mean to infer that it is possible for us to outshine the brilliancy of the work of the ancients, or of the masters of the Gothic or Renaissance periods. Our object is not to revive this or that period, but rather by the study, contemplation and comparison of that which has gone before us in all that is noble, beautiful and pure to acquire those principles of proportion, those refinements and elegancies of form and detail which have been the constant admiration of mankind in all ages. By such reflective study we seek to originate an inspiration which will subserve itself to the utilitarian requirements which our day and generation demand from us as architects, form being subservient to purpose, and use put into effect may be so suitably and constructively dressed as to commend its result not only to those who employ us, but to all intelligent and thinking observers of the beautiful and suitable in the greatest of the constructive arts. We feel that the deeper, the wider, and the more analytical our study of the work of the past, the better shall we be equipped for the production of original work, and the less likely shall we be to fall into the dry and uninteresting groove of the mere copyist. We desire no "New Art," casting aside in a moment the traditions of the past, but a steady and rational development on a sure and solid foundation; the same process of development which has produced everything in art which has been lasting and worthy of admiration.

Our ideal is no doubt a very high one, and in order to achieve it so far as it lies in our power we have collected for the guidance and instruction of our students (if I may quote from a recent address) "Brains, similar to the collecting of rare books or works of art." In our instructors we have a body of gentlemen of attainments which our predecessors in this Association would have envied. The requirements of the fully qualified architect cover so wide a range of knowledge, and true education is so lacking in most of us, that many are prevented from attaining the best results. We endeavour to bring the average man, who comes to us with his mental capacities trained at a good school, in contact with the best brain power the profession can offer him, and this before bad professional mental habits are formed, which eventually would lead him to wander illogically from pencil to paper, and thence into practical being in a building, which, unlike a picture, cannot be painted out, or hidden away from the gaze of mankind.

The Average Architect.

I am not afraid to assert that architecture in this country is cursed by ignorant mental habits which a simple and well-defined system of education would have rendered impossible. Even the genius (there are such, and we are glad to have them, though their percentage is small to the generality of men) may profit in no small degree by the training and knowledge we have to offer him. But it is to the average, not the exceptional, man that I wish more especially to address myself. An employer seeks the services of an architect in his necessity; that man usually is the average man. Generally speaking it is the

all-round man of good average ability who, by dint of long, patient and persistent study, is he who makes the most successful and valued practitioner. Speaking the other day of another profession, the President of the British Association said: "It was in the abundance of ordinary plodding ability, thoroughly trained and methodically directed, that Germany at present has so commanding an advantage." These weighty words abundantly express what it is the object of our Asscciation to provide, and what, I sincerely trust, it is the whole-hearted aim of our students to acquire.

We have no new style to invent. It would be as sensible to invent a new language for the British nation. But as we read Shakespeare, Milton and Addison, or study the elegancies in diction of Lamb, Burke, or Bright in writing and speaking in beautiful language, so our endeavours should be to graft upon the construction of our designs such sympathetic qualities as shall form a perfect marriage between the beauty and form of the architectural outlines and the practical necessities and objects of our buildings.

Cramming.

Our educational work is not to cram for an examination; far from it. The examinations of the Royal Institute of British Architects do indeed test our work, but are a means, not the end, we have in view. It is to be regretted that crammers do exist. I again quote Professor Dewar's brilliant address, which is singularly applicable to us as architects: "There are," said he, "plenty of chemists turned out now by our Universities, but they are of no use for practical purposes. They are chockful of formulæ. They can recite theories and they know text-books by heart. But put them to solve a new problem freshly arisen in the laboratory, and it will be found that their learning is all dead. It has not become a vital part of their equipment, and they are 'floored' by the first emergence of the unexpected." Now, the end of all this is to show that our desire is to make our students learn to think "as a vital part of their mental equipment."

A Word for Competitions.

Much has been said, and much more no doubt will be said, on the much-vexed subject of Architectural Competitions, and I do not wish to enter upon a discussion of the question from its more controversial points of view. I am amongst those, however, who do not regard them as an evil to be fought against, and eventually, if possible, abolished. The fact that they provide the young and obscure architect with his opportunity seems to me to be sufficient to justify the principle without seeking further for reasons. Almost every argument which has been urged against them has not been so much against the system as against the abuses which have occurred in their conduct; these are undoubtedly preventable, and the remedy lies entirely in the hands of the profession.

It is, however, of the educational aspect of competitions that I wish to speak. I know of no better means by which a young architect can acquire knowledge and experience in design than by taking part in a competition for a definite building of an actual site; in no other way can he so well attack the practical as well as the æsthetic problems, and in no other way can he have an opportunity of comparing his efforts with those of more experienced and practised architects. If, however, he is really to profit by such experience his design must be a serious effort, carefully studied and re-studied until it appears to its author to be as perfect as he can make it, until he can conceive no possible objection or fault which is capable of remedy. The brilliant idea, the flash of genius, dashed off in half an hour, never did and never will succeed in a competition. And withal, the young competitor (and I might also add the old one) must always cultivate the habit of self-criticism, and must be always prepared and even anxious to admit his inferiority. He must always have in mind that his task is not merely to find a solution of the problem in hand, but the best possible solution. This, of course, should be the object in all design, competition or no competition, but I fear it is so in comparatively few cases, judging by the work we see around us every day. The principle of competition should give the necessary incentive for the effort required. It is, of course, essential that the conduct of competitions should be beyond all question, and that every possible means should be adopted in the selection to secure the choice of the best design submitted. Matters have greatly improved in this respect of late years, but much still remains to be done. The profession can, if they will, compel promoters to conduct competitions in a satisfactory manner, and all those who are working for this end should have the support of every architect in their endeavours.

The General Public.

Much as architects have to deplore the ignorance and apathy of the public towards their art, I believe there is slowly, but none the less surely, developing a movement towards a better appreciation of architecture. The building public are, I truly think, growing anxious to have real architecture, and are willing to pay for it if they can get it. It is our business to give it them, so far as lies in our power. Public bodies are becoming very keen to have buildings of which they can be proud, and which are not designed merely to serve their utilitarian purpose. One sees occasionally an architectural article in the daily press, evincing nearly always, it is true, an ignorance of the subject positively appalling, but still showing that there must be a desire on the part of the public for information. It is much to be regretted that these articles when they appear are so often incorrect and misleading. We, as architects, may, I think, do much to educate the public in these matters.

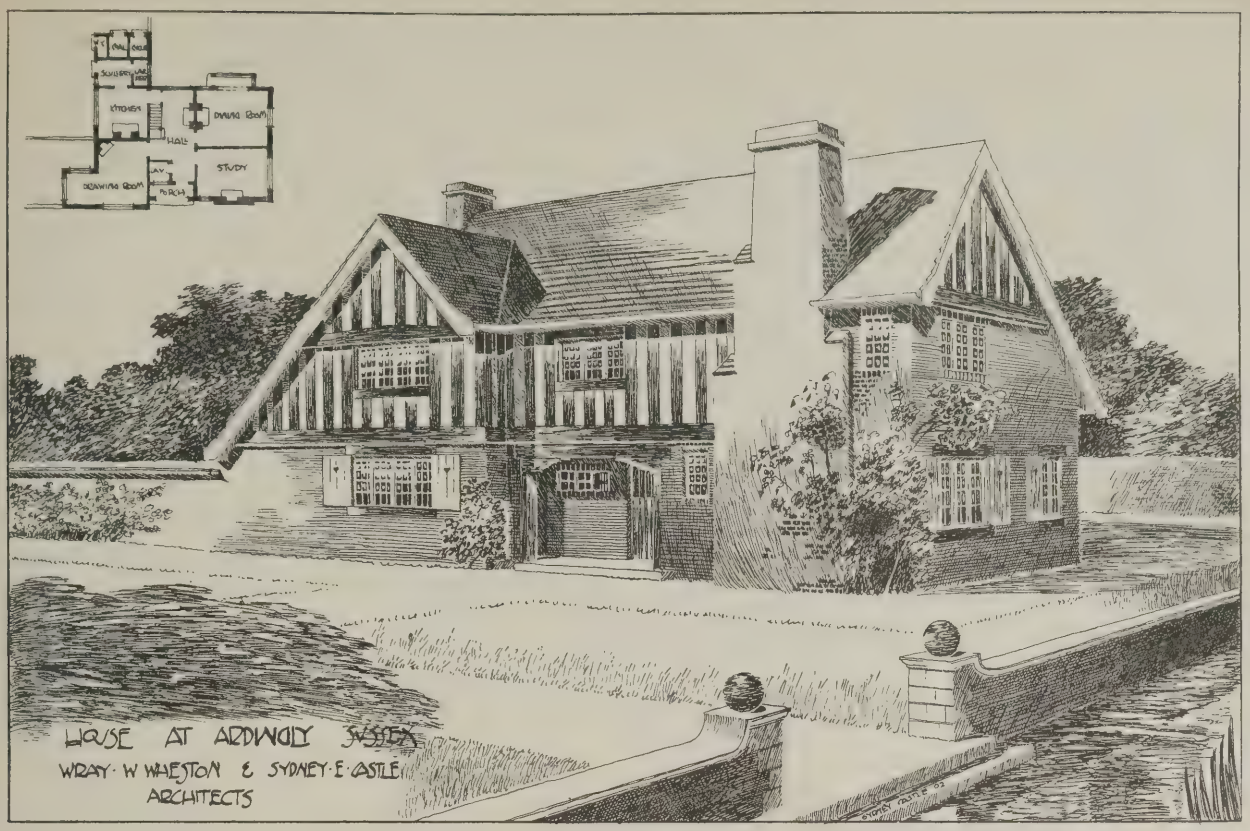
To the Younger Members.

Without apology to our seniors, I now wish to address myself more particularly to our younger colleagues, and especially to those members of our Day School whom we are glad to cordially welcome within our ranks. You have entered one of the most fascinating and noble of professions it is possible to select, and with diligence and devotion to your studies you will find your work provide you with many recreations. Art is long, and life at the best short, and you will find much to interest and delight you throughout your career, It is not given to everyone to be a genius born; indeed, it is well that it is not so, insomuch as many such are impractical and visionary dreamers in a matter of fact world. Your ultimate aim is to become a refined and capable practising architect, and with this in view you will do well to organise your studies into a system which for reference will stand you in good service in after years. Reflect upon what I have said as to the cultivation of the mental habit. Analyse the reason and basis of everything. It is not enough to sketch and draw. You must enquire and investigate as to why this is beautiful, and why that is unlovely. Above all, I would have you not regard your profession as merely a means of livelihood. That, of course, is a necessity, but if you are to excel, it must be your recreation, and indeed your life. The real and sweetest reward of your labour will always be the appreciation of your fellow workers, who know so well the difficulties you have had to meet, and can estimate the measure of your success.

Draughtsmanship.

It is all important that you should be capable draughtsmen. I do not by this wish to convey the idea that draughtsmanship is architecture; far from it, it is often the reverse; but by draughtsmanship an architect is able to record his conceptions and to dissect his ideas. A well-known professor of architecture at the Royal Academy, in urging precision, advised his hearers to throw away their india-rubber. I advise you to do the reverse. Do not be afraid of that invaluable means of erasure. Rub in and rub out until you have secured what you believe to be right. Above all things, do not work upon an empty head. You might as well work upon an empty stomach and expect to have physical energy and activity. But first feed your mind with examples, reflect upon and analyse these, whether from illustrations or your own recorded sketches. Then put these on one side and conceive what is suitable to the position and character of the subject in hand. You may be only the average man, but by persistent study and patient endeavour, precept upon precept, line upon line, here a little and there a little, you will be able to build up a reserve of information which will be of great and lasting value. Anyway, there is no room in the profession for the lazy man—I hope he is not here to-night—as the rewards which diligence brings have to be sought with love and labour. Your profession calls for some self-denial—it would not be worth much if it did not do so; perhaps some expenditure of midnight oil may be necessary, but this will not be detrimental if exercised with wisdom and moderation.

The Museums and Old Buildings.



The priceless collections in our museums await your inspection and study, together with an appreciative knowledge of the best works of painting, sculpture and the allied arts, both ancient and modern. The same may be said of the ancient buildings of London and the neighbourhood. The best works of modern architects seem to me to be a fruitful and helpful study which is not fully taken advantage of by our students. Our spring and summer visits, so admirably organized, will afford you facilities for going further afield.

It has, I fear, become somewhat the custom to decry the particular value of sketching and measuring, while the standard of draughtsmanship has advanced by leaps and bounds. In recent years it would appear that the healthy habit of sketching is not so universal as it was twenty years ago. I commend it most earnestly to your careful attention. Nothing that I can say will be of so much advantage to you as the systematic and careful collection of figured sketches. I do not mean thereby the production of pretty pictures—a snapshot will effect that—but the thoughtful study of an ancient feature, with a discrimination which gives, as far as possible, the reason why, is a valuable record; and the fact of delineating impresses the study upon the mind for ever, and leaves a permanent influence for good.

The reflective habit should also be cultivated, whether in the contemplation of a noble building or the reading of a notable book.

In conclusion, I trust we shall return to our studies and duties after the recess with renewed energies, and that we shall be intent upon carving for ourselves a little niche, and leaving some executed work behind us which shall make the world more beautiful than it was before, and call forth the approval of those who will follow us

Mr. Aston Webb, A.R.A., proposed the vote of thanks to the President, which was seconded by Mr. W. Howard Seth-Smith, and supported by Mr. John Slater, B.A., Mr. C. Harrison Townsend and Mr. E. W. Mountford.

New Patents.

These patents are open to opposition until November 10th.

1901.—Tenements.—19,953. J. U. MacAuslan, 180, West Regent Street, Glasgow. All the living apartments are contained in one building and all the water-closets, lava tories, &c., in another, the two having an air space between them and being connected by platforms.

Photo-Sculpture.—21,245. W. A. C. Selke, Leipzigerstrasse 128, Berlin. The object is placed on a rotating disc and is photographed by a cinematographe under strong electric light. The series shows all the different "light sections" during one revolution: and the reproduction in plaster is built up from these sections.

The following specifications were published on Thursday last, and are open to opposition until November 17th. A summary of the more important of them will be given next week. The name in italics is that of the communicator of the invention.

1901.—18,266, Ogden, stop valves. 18,417, Abrey, plastic compositions applicable as electric insulating and acid-proof materials, &c. 19,498, Titcomb, digging, hoisting and conveying apparatus. 15,598, Defries & Feeny, tank wagons for receiving sludge, sewage, &c. 21,399, Reid, supporting, stretching and releasing tapestries. 21,406, Procter, weather-bars for French windows, &c. 22,461, Völker, washable embossed wall coverings. 22,561, Howell & Milner Safe Co., Ltd., latches, locks, &c. 23,748, Appert, rollers for sheet glass with impressed designs.

1902.—7,276, Curtis, taps. 7,682, Keyes, plate glass. 7,779, Stannard, fittings for drawing boards. 12,058, York, beams, girders, &c. 14,377, Spratt, Spratt & Spratt, drawing board. 14,690, Thompson (*Carryl*), apparatus for painting or cleansing surfaces. 15,145, Delhaye, Briatte & Dupuis, parquetry.

COLUMNS AND CONCEPTIONS.

A CRITICISM OF THE GREEK.

MR. LAURENCE HARVEY, who has just made a visit to Athens, writes to "La Construction Moderne" a letter which will interest architects, and particularly those architects who have made a scientific study of the monuments on the Athenian Acropolis. Mr. Harvey, it may be remarked, belongs to the modern school of architects, in that he likes to compare the information furnished by poets and essayists in regard to architecture with the evidence of his own senses, and occasionally with the conclusions which his trained intelligence suggests to him. Studying, before the ruins of the Propylæa, the rapturous description of Baedeker's "Guide," he was surprised to read that the interior columns of the Ionic order were 3ft. 2in. in diameter at the foot and 33ft. 7in. high. This would make them nearly eleven diameters high, and, as a conscientious pupil of the École des Beaux-Arts, he was not prepared to admit that an antique example of the order could be so abnormally slender. Moreover, the height given by Baedeker would bring the capitals of the interior columns to a level with the cornice of the exterior order, and, as it is to be presumed that the portico was covered with marble slabs, like other structures of the kind at that period, it is obvious that the covering, with interior columns of the height given, would show from the front above the cornice. As this is hardly admissible, Mr. Harvey concludes that the interior columns, of which only the bases and a few fragments remain, were probably of the same height as the exterior ones, which would give them a proportion of nine diameters, and that they carried architrave blocks, at the same level as those of the exterior order, on which the marble ceiling slabs could rest safely; and this view is confirmed by the fact that an architrave block, apparently belonging to an interior order, still lies on the ground among the other fragments of the building.

Mr. Harvey, in speaking of other Athenian buildings, gives expression to a thought which has probably crossed the minds of many other architects, that the Greeks, notwithstanding their exquisite keenness of perception and sense of beauty, did not always show that completeness of conception of their buildings which a modern architect regards as necessary, and which is so characteristic of the mediæval period. In the Theseum, as he points out, the columns of the porticos are laid out without any regard to the ceiling panels, and, in consequence, the marble slabs of the latter are sustained by stones placed almost at random, or, at least, corresponding neither with the colonnades nor with the walls of the cella; and, in order to find a support for some of these stones, it has been necessary to raise the ceiling of the western portico about 8in. above that of the lateral porticos. In the same way, the northern portico of the Erectheum, beautiful as everyone acknowledges it to be, is longer than the front of the building behind it. The fact that this brings the opening between the two middle columns, and the door behind them, out of the axis of the main body of the temple would not probably disturb the Greeks, who did not care for exact symmetry; but, looking from the court of the Erectheum, which was open to everyone, the misfit of the portico must have been painfully obvious.—(From the "American Architect.")

House at Ardingly, Sussex.—This house is proposed to be executed in oak half-timberwork 10in. wide, with red bricks in Flemish bond and white rough-cast. All the external woodwork to be of oak; the windows to be glazed with lead glazing and the frames painted white; roofs tiled with old tiles of good colour. The interior of the hall is also treated in oak, and there is to be a specially-painted frieze to the study. Messrs. Wheston & Castle, "The Studio," 22, Louvaine Road, S.W., are the architects. The drawing was exhibited at this year's Royal Academy.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

The Four-centred Arch.

PILSLEY.—F. G. B. writes: "How are the centres obtained to describe what is called a four-centred arch?"

A four-centred arch is a pointed one having the upper part (crown and upper part of haunches) struck from two centres considerably *below* the springing, like any Gothic pointed arch with the lower part of the haunches struck from two centres *on* the springing line.

Surveying: Instruction by Correspondence, &c.

BRECON.—RURAL writes: "(1) Which is the best way to obtain instruction by correspondence in surveying and the various subjects necessary to pass the examination of the Surveyors' Institution? (2) What books would you recommend? (3) Are lectures given in any town in South Wales on these subjects, including field work? (4) Is the candidate supposed to have a knowledge of the various surveying instruments now in use? —the syllabus is not clear on this point."

(1) Several tutors for this and similar examinations advertise in our columns and those of our contemporaries. (2) It would be best to place yourself in a tutor's hands and to follow his advice with regard to books. (3) We are not aware of any lectures for the Surveyors' Institution that are given in South Wales. (4) The level and theodolite should be thoroughly mastered, both practically and theoretically, but questions relating to other instruments are rare. G. A. T. M.

Measuring Window Frames and Sashes.

WIMBORNE.—L. B. F. writes: "What is the common method of measuring window frames and sashes in co. Dorset? Are the openings only (*i.e.*, between jambs and top of sills to underside of head) measured or are 4½in. allowed at both sides and also at head?"

In measuring sashes and frames 4½in. is added to the width of the opening on each side and 3in. at the head. W. E. D.

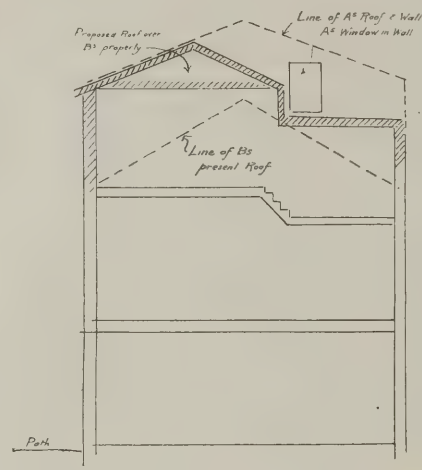
Designing Tie-Bars of Roofs.

LONDON.—STUDENT writes: "What is the usual method in practice for determining the useful area of a flat tie-bar? Suppose, for example, a tie-bar having an area of 3 sq. in. is required. This we will say is given by a 6in. by ½in. flat bar, but deducting the rivet hole, say, 4 sq. in., the useful area of the bar is 2·6 sq. in. only. Now, is it the practice to use a bar giving the nett area, after deducting the rivet hole, or would the bar be 'swelled' at the ends to make up the area where the hole occurs?"

In flat tie-bars for roofs and other purposes it is usual to deduct the area cut away by rivets or other connections, so that the minimum sectional area corresponds with the calculated requirements. It would not pay in ordinary work to swell the ends to compensate for the holes; of course there is waste of metal, which is cheap, but as a set-off there is economy of labour, which is dear.

HENRY ADAMS.

Lowering Two Floors.



BRIGHTON.—H. G. writes: "I intend to make some internal alterations to some property, and part of the scheme necessitates lowering the existing first and second floors. How can this be done? The floors are of 11in. joists, and about 22ft. by 15ft. 9in. The present height between them is 12ft., and I wish to lower the first floor 1ft. 6in. and second floor 5ft. There are cellars under the ground floor."

This reads more like an American job than an English one, but no suggestions for doing the work can be given without further information. It is not stated whether the walls are of brick, and of what thickness, if the building is detached, if there are plaster ceilings below the floors, whether there are fireplaces, staircases, &c., to consider. Whether the walls are to remain standing as at present, and only the floors to be placed lower down, or whether the building is to be lowered the stated amounts. Whether the windows are to be lowered as well as the floors. In fact, it is a case requiring very detailed description or personal examination, and it will be better to call in a local architect to advise.

HENRY ADAMS.

Ancient Lights.

HASTINGS.—J H. writes: "A has a window in his side wall overlooking B's property. B wishes to raise his roof, but A will not consent to his window being shut in. Would B by constructing his roof as shown by the accompanying illustration, without A's consent,

lay himself open to an action at law for obstructing A's light and air, or would it be considered as no obstruction?"

Though there is a little obstruction of side light, it is so slight that no jury would award more than nominal damages were the case taken into court. G. A. T. M.

Some Building Terms.

PORTSMOUTH.—SUBSCRIBER writes: "(*a*) What is meant by a 'coped edge' to Yorkshire stone? (*b*) What are 'double arris joggle pebbles and cement' and 'double **V** joggle pebbles and cement'? (*c*) In connection with stairs, what is meant by 'state if soffits are flueing'? (*d*) What is meant by a curb joint being 'plugged' with lead? (*e*) What is 'horsing to vaults'?"

(*a*) Edge of stone dressed to show as edge of coping, as distinguished from what would be sufficient to form a joint in paving. (*b*) "Double arris," an unstopped chamfer. "Joggle pebbles and cement" means notches to joggle, cut, and when the stone is laid (coping stone, quay wall or otherwise) the opening—square or other shaped hole—is filled with pebbles and cement well rammed home. (*c*) Soffit showing continuous twisted surface. (*d*) Joggle similar to (*b*), smaller and plugged with lead instead of pebbles and cement. (*e*) The arrangement for supporting the centering.

Failure of Concrete Foundation.

EDINBURGH.—L. A. writes: "A considerable settlement was recently observed in a building erected from my designs. On opening the ground at a corner column, we found that the concrete foundation had broken in the middle. The column carried about 30 tons. The foundation was 9ft. 6in. by 6ft. 6in., and the column (cast-iron of 9in. diameter) was placed towards one end of it. The base plate of the column is 2ft. square. The concrete was extended to the left in order to bridge a drain. Granted that excessive rain had caused the ground underneath the concrete to be loosened, is it possible that the concrete is good concrete to break under such a strain? The full load was not applied until about three months after the concrete was laid."

A plan of the corner of the building should have been given, and the nature of the soil stated. The distance of the column from the edge of the concrete and the composition of the concrete should also have been given, and the position of the drain to scale should have been shown. In the natural course of things the concrete should have broken on the other side of the column, so that it would appear that there was some special want of cohesion at the part that has failed, but the conditions are so loosely given that it is impossible to reply more definitely. Enough is however given to show that the foundation is badly designed. HENRY ADAMS.

Fixing a Glass Slip across a Window.

PORTMADOC.—PLATE writes: "Across the face of a certain shop window glazed with polished plate ¼in. thick, I want to secure a plate-glass slip 4in. wide and ¼in. thick. The pane is 84in. wide. In what way could this best be done? The pane will have no other support than a little at each end."

(*a*) The slip might be stuck on with Canada balsam between it and the pane. (*b*) It might be fastened by drilled holes and small brass bolts, brash washers—separated from the glass by india-rubber. If placed close to the pane, moisture may lodge between, dust will get in and vegetable germs will grow, as may be seen where glass overlaps on roofs. If the purpose to be served permits it, probably the best job will be made by bolting the slip to the pane, keeping it some little distance apart from it either by shoulders on the bolts or washers: in this way water will not lodge capillarily, and the dust which will more or less find its way in may be removed by passing a piece of soft cloth between the slip and the pane from time to time.

Stresses on Coal Hoppers.

LONDON.—STUDENT writes: "It is required to ascertain the horizontal pressure upon the sides AAAA of the coal bins and hoppers shown by the accompanying sketch (not reproduced); also the vertical loads upon these sides and hoppers. The sides are really self-supporting, being solid web girders carried upon stanchions."

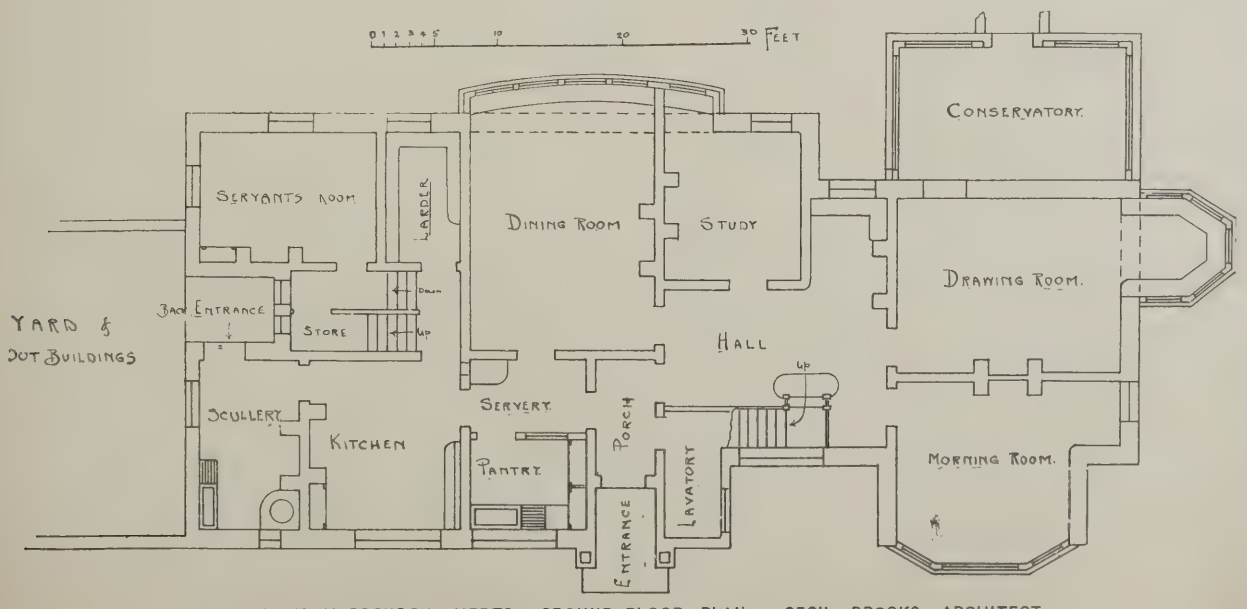
The writer has had many years' experience in designing and constructing large coal hoppers, which is a speciality not capable of being imparted to others without considerable space and time being available, and in this case the information given is insufficient to enable the matter to be dealt with thoroughly. The natural slope of coal in a hopper is 40 degs., the angle at which it will run down a screen is 35 degs., but tipped into a shoot it will run at as little as 25 degs. when dry or 30 degs. when wet. The pressure on the sides of a hopper is calculated in the same way as against a retaining wall. The load on bottom and on supports is the same as if it were any other load. No dimensions are given or any clue to the size of the hopper, which may contain anything from 1 ton to 100 tons. If more than this is to be carried it is usual to build a series composed of unit hoppers. There is no book published on the subject. It should be remembered that wrought-iron rusts very readily in a coal hopper, from various causes.

HENRY ADAMS.

CECIL BROOKS, ARCHITECT.

Books for Inspectors of Nuisances and Surveyors.

ASHBURTON.—C. E. L. writes: "(1) Is there any text-book containing the sections of law required to be known by the examination of inspector of nuisances, and those only? (2) Kindly recommend an inexpensive but trustworthy book on surveying."



(1) "The Sanitary Inspector's Guide," by Henry Lemmoin-Cannon (London: P. S. King & Son, Orchard House, Westminster; price 3s. 6d. nett). (2) "Surveying and Surveying Instruments," by G. A. T. Middleton (London: Whittaker & Co., 2, White Hart Street, Paternoster Square, E.C; price 5s.).

Pumice-Stone Building Material.

PRESTON.—VITRUVIUS writes: "Can you give me any information of a building material into which pumice stone enters, and which is largely used in Germany? Are there any buildings of or agents for the material in England?"

Concrete both in slabs and *in situ* are made, using pumice and Portland cement. It is of course used because of its lightness. We do not know any agents for a special systematic use of this material in England; but according to a recent German report there is in the Neuwied district along the Rhine, between Coblenz and Andernach, an extensive industry in the manufacture of bricks from volcanic sand and pumice stone, which are found along the base of the Eifelberg. In working the deposits the surface soil is stripped off and the sand is piled up, to be shovelled into the mixing bed of water and lime close at hand. The pumice comes out of the earth in pieces varying in size from grains to lumps about 4in. across. It occurs in layers, but is frequently interrupted by small patches of more solid fragments of lava. Before moulding the pumice is screened, larger pieces being broken to pass through a sieve with ½in. meshes. These screened pieces are then covered with a thin coating of cement, and the brick is moulded. The cement is not mixed with the pumice so as to form solid cement blocks, but by the fragments being coated first. The brick is then obtained by these coatings adhering to one another. In the manufacture of 20,000 bricks about 4½ tons of lime are required. After the mixing process the substance is poured into iron moulds provided with bottoms of detachable boards, which, after the removal of the moulds, act as driers. When the bricks have been exposed to the air for a very short time they are ready for shipment. No modern machinery is used. A workman makes from 800 to 1,800 bricks a day.

House at Harpenden.—The materials used for this house are Bracknell special facing bricks, the roof and upper storeys being covered with red Broseley tiles. A feature is made of the hall, which is oak panelled; the staircase is also finished in oak. The woodwork externally is painted white and the casements green. Mr. Cecil Brooks, of Harpenden, and 23, Old Queen Street, Westminster, is the architect. The drawing was exhibited in this year's Royal Academy.

HOUSE AT HARPENDEN HERTS: GROUND-FLOOR PLAN. CECIL BROOKS, ARCHITECT.

Keystones.

The Queen Victoria Memorial Fund now amounts to £210,000.

The Mairie at Neuilly, near Paris, is to be elaborately decorated with ten ceiling pictures by citizens of Neuilly or of Paris. The subjects selected will depict the history of the town. The project will cost 50,000 fr.

A new Welsh Congregational Church at Llangollen is being erected in Princess Street. It will provide seating accommodation for 450, and the estimated cost is £2,500. The architect is Mr. Owen Roberts, Portmadoc; and Mr. D. Roberts, Llangollen, is the contractor.

The new Church of St. Peter's, Edmonton, in Bounces Road, was consecrated recently. The cost of the building, £10,000, is defrayed by the Ecclesiastical Commissioners from money received by them for the sale of a site of one of the City churches. The new church is in the Gothic style, of red bricks, terra-cotta, and faced with Portland stone. There is seating accommodation for 840 persons. The font is the gift of the architects.

A new Town Hall for Lambeth.—The Lambeth Borough Council is arranging for the purchase of land at Brixton for the erection of a council chamber, municipal offices and town hall. The proposed site is at the south corner of Acre Lane, at the foot of Brixton Hill, in close proximity to the railway station and the Tate Central Library. The estimated cost of the land is £25,680, which is at the rate of 12s. 6d. per ft.

The West End Church and Schools, Hammersmith, were opened last week, after having been entirely redecorated and electric light and heating apparatus installed. The apse end of the church has been remodelled, and a new pulpit, marble baptistry, choir seats and organ placed therein. Messrs. W. O. Collingwood & Co., of 3, Great Tower Street, E.C., were the contractors. Their contract amount was £1,158 15s. Messrs. George Baines, F.R.I.B.A., and R. Palmer Baines, of 5, Clement's Inn, Strand, W.C., were the architects.

M. Rodin is engaged on two magnificent *frontons*, measuring four mètres in length, destined for the castle of a wealthy *amateur* who resides at Evian-les-Bains. The subjects are the Four Seasons, represented by women, appearing from the stone in the sculptor's well-known manner. "Spring" is shown as if in a dream, "Summer" disports herself in the quiet waters of a river, "Autumn" with full eyes regards the fruit of the earth, and "Winter" turns towards the stone and darkness. Between the last two figures appears a child signifying the hope of generations to come.

At the Ancient Parish Church of Little Marlow, Bucks, which is now being thoroughly restored, three discoveries were made last week. In the chancel wall was found an old "priest's door," which had been so completely blocked up that only a careful inspection could trace any indication of it in the rough rubble surface that the wall presented. Careful cleaning and clearing out has given back the complete stone arch, with some of its mouldings. The second "find" is the original opening to the rood-loft, though no indication remains of the position or character of the steps by which it was approached. The third discovery was made within a cavity in the wall which constituted once the opening to the loft and consisted of a Norman piscina, which retains its old dog-tooth mouldings. This was simply deposited in the hollow space left when the surface of the entrance was plastered up, it is supposed, at the Reformation. It is to be replaced in the corner from which it was torn.

A New Volunteer Drill Hall has been erected at Connah's Quay at a cost of about £1,000.

New Municipal Buildings at Buckhaven, Fifeshire, were opened recently. Mr. Todd was the architect.

A Memorial Cairn has been erected in the wilds of Gaick Forest, about 14 miles from Kingussie. It marks the spot where, on the last night of the eighteenth century, occurred a catastrophe which resulted in the death of a noted Highland chieftain and proprietor, John MacPherson of Ballychroan, as well as of his friends and ghillies. The monument is of local stone, chiselled and cemented

New Premises for the Bathgate Co-operative Society have been erected at a cost of something like £10,000. The buildings occupy about three acres of land, and have a length of frontage of 165ft., containing six shops on the ground floor, with offices, workrooms and a large hall on the second floor. The stables, bakery, &c. are detached and to the rear of the main building. The architect is Mr. J. Graham Fairlie, of Edinburgh.

Partnership Dissolved.—In consequence of Mr. Hubert S. East's decision to return to the Colonies, the partnership hitherto existing between him and Mr. Edmund W. Wimperis is dissolved as from October 1st. Mr. Wimperis will in future carry on the practice alone, under his own name only, at 6, Vigo Street, W., to which address he has moved in order to secure more adequate and convenient offices.

The Elswick Mechanics' Institute, Newcastle-on-Tyne, has been extended by the addition of a new wing at the north end of the old building, connected by a corridor. The new portion comprises three storeys. The architect was Mr. S. D. Robins, Percy Street, Newcastle, and Mr. S. F. Davison, Newcastle, the builder. Messrs. T. G. Usher & Co. fitted the electric installation, and Messrs. Athwell & Nesbit, of London and Leicester, the heating apparatus.

Guildford Corn Exchange.—A good deal of feeling has been aroused in Guildford by a proposal recently adopted by the Town Council which, if carried out, will involve the demolition of the old Corn Exchange, one of the distinctive features of the picturesque High Street. This building, which stands immediately opposite the quaint old Town Hall, with its clock projecting over the street, was erected at the beginning of the last century, and is considered to be a very good specimen of Doric architecture. For very many years the charges for the county were held in the building. The Town Council has recently erected a new Corn Exchange in the Cattle Market, and in order to widen the narrow roadway known as the Tunsgate, and make a better approach to Pewley Hill, it is proposed to remove the Corn Exchange and other buildings.

A new Methodist Church and Schools at Hillsbro' have been erected from designs by Messrs. J. W. Frith & Son, of Oldham, at a cost of about £5,500. The style is Gothic and the main frontages are built entirely of stone, the outside facings being of Brighouse Pierpoint, relieved by Grenoside dressings. The sides of the chapel and schools are faced with brick. The roofs are covered with Welsh slates. The walls inside are wainscotted in pitch-pine The contractors were:—Excavating, drainage, brickwork, stonework and concreting, Mr. Harris Wood, Shepley, near Huddersfield; carpentry and joiners' work, Mr. George Broadbent, Shepley; plumbing, glazing, painting and varnishing, Mr. George Lindley, Shepley; slating and plastering, Messrs. George Beard & Sons, Thurlstone, Penistone; hot-water engineering, Messrs. W. S. Spencer, Oldham.

The new Church of Emmanuel at Stoughton, near Guildford, has been erected.

L.C.C.'s Millbank Buildings.—An effort is being made to secure the formal opening of these buildings by a member of the royal family.

St. Faith's, Stepney, was consecrated on Saturday. It is built of red brick and Bath stone, and has cost £16,000. Messrs. J. E. K. & J. P. Cutts, of London, were the architects.

A new Sanatorium for Consumptives.—At a meeting of the local society for the prevention of consumption at Newcastle last week it was decided to build a sanatorium for consumptive patients in Northumberland and Newcastle. The proposed building is to accommodate fifty patients, and will cost £50,000.

The Treasure House of the Athenians.—The Greek Minister of Public Instruction, accompanied by the Director of the French School and the Mayor of Athens, have gone to Delphi to make arrangements for the restoration of the Treasure House of the Athenians, the remains of which have been revealed by recent excavations.

A Colosseum for London is to be built on a site off St. Martin's Lane. It will be in Italian Renaissance style, and will have a lofty tower with a revolving globe on top displaying the word "Coliseum." The auditorium will accommodate about 3,000 persons and the stage will be 100ft. square. The cost is estimated at £100,000. Mr. Frank Matcham is the architect.

Excavations in Greece.—The excavations which have been carried on for some time past for the discovery of the Temple of Venus on the ridge of Mount Kotilyon, in Arcadia, have been crowned with success. Part of the temple has been brought to light, and M. Kavadias, general inspector of antiquities, feels certain that the whole of the temple will soon be unearthed. Pausanias speaks highly of this temple. The excavations are made under the care of M. Kourounioti, inspector of antiquities.

A new Bank Building at Bethnal Green has been erected for the London City and Midland Bank at 465 and 467, Bethnal Green Road. The contractors were Messrs. E. A. Roome & Co., of 36, Basinghall Street and Urswick Road, Homerton. The elevations, both in Bethnal Green Road and Hollybush Gardens, are of granite and Bath stone. The architect was Mr. T. B. Whinney, of 8, Old Jewry, E.C. The fireproof floors were laid by the Columbian Fireproofing Co., of 37, King William Street, E.C., and the electric lighting is by Mr. Charles Winn, of 106, Union Street, Borough.

Condition of Chichester Cathedral: Report of Mr. Somers Clarke.—In his report to the cathedral authorities Mr. Somers Clarke states that the western porch demands attention. Over the arch enclosing the west doors are two ugly cracks, one of old standing the other of recent date, and apparently extending. The front wall of the porch has bulged and the joints of the stonework are open in many places. Mr. Somers Clarke, among other suggestions, recommends that a large tree opposite the porch should be cut down because it prevents the action of sun and air on the western façade, to the detriment of the stonework. He reports that the walls of the detached campanile or bell tower are "in a splendid state, solid and sound," without sign of crack or settlement, but finds that the surface of the stone, which was taken from Quarre Abbey, near Ryde, in the fifteenth century, has been largely eaten away by time and weather, in some places to a considerable depth. In preference to recasing the tower with new stone Mr. Clarke suggests treating the surface with a solution of baryta, and experiments are in progress to test its suitability.

The Church of St. Mary, Eastry, near Dover, has been reopened after extensive restoration. This church was erected in 1215, and was the third built on the same site a thousand years age.

Proposed new Public Park for Birmingham.—It is proposed to secure by public subscription the Lightwood Estate at Birmingham and convert it into a public park to be handed over to the Corporation for maintenance.

Roman Remains in Hayling Island.—Mr. Talfourd Ely has removed the earth from a space measuring 50ft. by 30ft. in the south-east corner of the Roman site in the Towncil Field, North Hayling. Considerable light has thus been thrown on the arrangement and plan of the buildings excavated by him in previous years.

A New Church at Bridlington is being erected for Hilderthorpe Parish. The site adjoins Cadigan Road, and the church when completed will accommodate 794 persons. It will consist of nave and aisles, with a narthex at the west end, in a part of which the font will be placed, and there will be porches on each side. The scheme contemplates the building at some future time of a parish room on the north side of the church, with communication by a covered corridor. The tower and spire will be at the east end of the morning chapel, and will be 155ft. high. In the meantime it is only intended to build the nave and the aisle. The architects are Messrs. Brodrick, Lowther & Walker, of Hull and Bridlington. The cost of the entire scheme, including the parish room, will be about £6,000; but the nave and aisle now to be built will only cost £2,700.

Trade and Craft.

The Automatic Lift.

In the time to come—the Machine Age—there will be no need for human attendants, for we shall be silently served by strange automatons that will never tire night or day, will ask no questions, and for wages will only need a little current and a little oil. There used to be a man in every lift—in fact, this is generally the case still—but we are getting rid of that man, and eventually only a button will be left to remind us of him: indeed, such pressing of buttons is to be that our descendants will develop abnormally large finger tips and the doctors will discover a new disease called phalangitis, or something similar. But, without contemplating the possible evils of so remote a time, we may see the advantages which an automatic electric lift offers to-day. You step into it and the gate closes of its own accord. Let us say you wish to ascend to the third floor. There is a row of buttons on one side of the lift and you press No. 3. Immediately the gear is started and you go up till the third floor is reached. Here the lift stops automatically; you open the gate and step out on to the landing; then you press a button fixed on the wall and the lift goes down to the bottom again. The convenience of the arrangement is apparent. Moreover it should be explained that the lift can be made to go up or down as required, though we believe it is not possible for anyone on the upper landings to make the lift come up by pressing the button provided there. These lifts have been extensively adopted on the Continent, and many of the large apartment houses in Paris are fitted with them: but in this country they are a novelty, though doubtless they will become popular as soon as their advantages are generally known. The "Titan" lift is on this automatic system, and Mr. William Gyllich, of St. Olave's House, Lloyd's Avenue, London, E.C., will send a booklet giving full particulars of it to anyone interested in the subject.

New Companies.

F. Drake & Co., Ltd.

Registered to acquire the business of timber merchants and sawmill owners carried on by the Baltic Sawmills Co., Ltd., at Strood and Rochester, and to carry on the business of timber merchants, sawmill owners, timber growers, buyers, clearers, planters and workers of timber estates, &c. Capital £20,000 in £1 shares (4,000 six per cent. cumulative preference). The first directors are W. F. Wallis, F. Miskin, R. G. West and F. Drake. Registered offices: Medway Wharf, Canal Road, Strood.

British Smoke Consumer Co., Ltd.

Registered to adopt an agreement with T. Ireston, of Birmingham, for the acquisition of Patent No. 19,631, dated November 2nd, 1900, and the patent rights of an invention for improvements in the combustion of fuel and furnaces, and to carry on the business of manufacturers of apparatus for the consumption of smoke, the economising of steam, and the combustion of fuel. Capital £4,000 in £1 shares. The first directors are J. J. Gittings, C. H. Reynolds and F. Wilton. Registered office: 60, Newhall Street, Birmingham.

Steyning Limeworks, Ltd.

Registered to carry on the business of lime burners and manufacturers, brick, tile, pipe, pottery and earthenware manufactures, dealers in builders' materials, chalk, lime, coal and brick-earth workers, &c. Capital £1,000 in £1 shares. Registered office: Railway Station Yard, Wimbledon, Surrey.

R. H. Roberts & Co., Ltd.

Registered to acquire the business of timber agents and importers carried on by R. H. Roberts & Co., and to carry on the same. Capital £1,000 in £1 shares. Registered office: 86, Leadenhall Street, E.C.

H. A. Gilson, Ltd.

Registered to carry on business as carmen and contractors, coal-owners, colliery proprietors and agents, builders and contractors, &c. Capital £10,000 in £1 shares. Governing director, H. A. Gilson, Hornsey Station, N.

C. Burley, Ltd.

Registered to acquire the business now carried on at Borden, Murston and Sittingbourne, in Kent and elsewhere, as C. Burley, and, generally, to carry on in all or any of their respective branches the businesses of brick, tile, terra-cotta, earthenware and fireclay manufacturers; dealers in sand, lime, cement, flint, gravel, &c. Capital £50,000 in £1 shares. Directors: C., W. T. and F. F. Burley.

Coming Events.

Wednesday, Oct. 8.

Sanitary Institute (Lectures and Demonstrations for Sanitary Officers, Part I.).—Mr. J. Priestley, B.A., M.D., on "Sanitary Law," 7 p.m. Inspection and Demonstration at Lambeth Disinfecting Station, Wanless Road, Loughborough Junction, at 2.30 p.m.

Institute of Sanitary Engineers, Ltd.—Meetings of Examination and Literary Committee at 4 p.m., General Purposes and Finance Committee at 4 p.m., Election Committee at 5.15 p.m., and Members Sessional Meeting at 7 p.m.

Thursday, Oct. 9.

Manchester Society of Architects.—Presidential Address by Mr. Alfred Darbyshire, F.R.I.B.A., F.S.A.

Friday, Oct. 10.

Sanitary Institute (Lectures and Demonstrations for Sanitary Officers, Part I.).—Mr. J. Priestley, B.A., M.D., on "Sanitary Law," 7 p.m.

Saturday, Oct. 11.

Incorporated Association of Municipal and County Engineers.—Home District Meeting at Aldershot.

North of England Institute of Mining and Mechanical Engineers (Newcastle-on-Tyne).—Meeting at 2 p.m

Monday, Oct. 13.

Sanitary Institute (Lectures and Demonstrations for Sanitary Officers, Part I.).—Mr. J. Priestley, B.A., M.D., on "Duties of a Sanitary Inspector: Outdoor," 7 p.m

Wednesday, Oct. 15.

Sanitary Institute (Lectures and Demonstrations for Sanitary Officers, Part I.).—Mr. J. Priestley, B.A., M.D., on "Duties of a Sanitary Inspector: Indoor," 7 p.m. Inspection and Demonstration in the District of St. Marylebone at 3 p.m., conducted by Mr. T. Gorniot.

Architectural Association (Discussion Section).—Mr. Noel F. Barwell on "Some Recent Theories concerning Saxon and Early Norman Work in England," 7.30 p.m.

Friday, Oct. 17.

Sanitary Institute (Lectures and Demonstrations for Sanitary Officers, Part I.).—Mr. J. Priestley, B.A., M.D., on "Duties of a Sanitary Inspector: Offensive Trades and Trade Nuisances, &c." 7 p.m.

"SPECIFICATION."

THE STANDARD TECHNICAL AUTHORITY

1903.
5/=
Per annum.

THE PROPRIETORS call attention to the fact that they have received a large number of letters which speak of the 5th Edition of this work in the very highest terms, thus proving its incalculable value to

ARCHITECTS,
SURVEYORS,
ENGINEERS,

And all interested in the BUILDING and KINDRED TRADES.

The following are a few Extracts from some of these letters:—

"I have just received SPECIFICATION which I think is an indispensable book to all engaged in Municipal and Sanitary Work."
From an Inspector of Nuisances.

"If I may, I should like to add my good opinion of SPECIFICATION. As a Technical Reference it is most excellent. Several volumes in one. One would hardly like to be without it now."
From an Engineer and Surveyor.

"I have found SPECIFICATION exceedingly useful as a work of reference."
From an Engineer in the Malay States.

"The last number was the most useful book I ever had."
From a Surveyor.

"I consider the work should be in the office of every Architect, forming, as it does, in its plan and scope an invaluable source of reference in every point likely to be raised in ordinary architectural surveying practice."
From an Architect.

"SPECIFICATION is a splendid book and I will bring it before my students' notice."
From a Technical Instructor of Birmingham.

"SPECIFICATION has the World for its field. It is excellent in every department."
From a Water Engineer.

The Work can be obtained through any Newsagent, Railway Bookstall, or direct from the Publishers. Descriptive Pamphlet with full List of Sections and Summary of Special Contents will be sent free on application.

J. W. Lowe & Sons, Burton	9,387 0
T. Tildesley,* Willenhall	9,198 0

* Accepted.

The Masonry of Connel Bridge, which is built over Loch Etive, is well advanced, and the erection of the steelwork on both sides is now in progress. This structure forms a part of the Callander and Oban Railway extension from Connel Ferry to Ballachulish, and is the greatest engineering feat ever attempted in the Highlands. The design adopted is that known as the cantilever, and when completed the span of 500ft. will be the second largest in Europe, coming next to that of the Forth Bridge. The navigation for small steamers and other craft to the upper reaches of the loch must be preserved, and the clear height of the bridge above ordinary high tide is to be 50ft.

Our New Competition. In our next issue we shall publish full particulars of a novel competition which we believe will be of considerable interest and value to our readers. It has been urged against many competitions that they are a pure waste of time and labour, but, as will be seen, no such charge can be justly brought against this new competition of ours. Briefly, it consists in re-designing the front of some premises in Fleet Street. Work of this nature has often to be done by architects in practice and the experience which competitors—more especially architectural students—will gain in endeavouring to solve the problem in the best possible manner will, we think, serve them in good stead when similar work is placed in their hands.

L was a Layman. A layman having "several architectural friends" writes a lot of bosh to the "Times" about the Liverpool Cathedral Competition. He fills nearly half a column with a windy complaint which amounts to nothing more than this—Mr. Bodley and Mr. Shaw judged the architects according to the trouble they took with their designs, while the Executive Committee, "knowing that eminent and busy architects cannot spare the time to make special drawings for a competition of this kind, particularly invited these very men not to send in competitive designs, but to announce their willingness to enter into the final competition . . ." And then our lay friend goes on to name some of the men in question, but his mention of Mr. Leonard Stokes is rather unhappy, for it happens that Mr. Stokes sent in a very elaborate design for the cathedral, so our poor layman's argument is a pretty weak one—about as weak as that of the temperance advocate who corrected the Apostle's reference to taking a little wine with his "Ah! but that meant outward application." And thus the last state of that man was worse than before. Our dear layman is much in the same plight. He had better not risk another criticism.

Albany Cathedral. At a time when so much is being said about new cathedrals the illustration on this page is particularly interesting. Albany is the capital of the State of New York, and, compared with other American cities, is irregularly laid out. The capital, the State Hall and the City Hall (the two latter, of white marble, face the former across a square called Capitol Park) are perhaps its chief buildings, but this new cathedral of All Saints is very fine in its general effect.

CATHEDRAL OF ALL SAINTS, ALBANY, NEW YORK, U.S.A. ROBERT W. GIBSON, ARCHITECT.

Bribes. A London architect (F.R.I.B.A.) draws our attention to a printed circular letter which has been sent to him by a certain firm at Battersea. This firm manufactures varnishes, colours and paints, which can be offered "at prices comparable with equal quality far below those current." The difficulty of making representatives fully alive to the altered conditions of business compels this firm to conduct its business by correspondence. Ingenious so far; but this is the point of the letter—"We are willing to give that consideration which would otherwise be given in representatives' expenses in shape of a liberal commission for all business introduced to us." In other words, a bribe. The letter itself is not addressed to anyone, and the envelope gives no indication that our informant is an architect. Possibly a mistake—sent to the wrong address; possibly not. In any case it is useful for architects to know these little matters, though no honest member of the profession would specify somebody's varnishes because he was paid to do so.

Sonning Bridges. The proposed designs by Mr. E. L. Lutyens for the bridges at Sonning, published in "Country Life" for October 4th, would certainly be better than the iron bridge decided on. They consist of oak beams on timber piles, with struts radiating to support the beams at intermediate points in the spans. These beams have a slight camber, which adds strength where most needed and gives a pleasing varying line to the hand-railing. The roadway is formed of steel joists and concrete. The first design, with brick piers just above the water line, would be more permanent than the second, in which the piles are merely driven into the river bed. The cost of replacing the existing timber portions and repairing and widening the brick arched construction from 16ft. to 20ft. is estimated by Messrs. William Cubitt & Co. at £6,158 and £4,264 respectively, as against £8,000 for the iron bridge. As to stability, we may mention that Brunel's timber viaducts on the Great Western Railway were built more than a century ago, and have stood the vibration and wear of fifty years of railway work.

RECENT STREET ARCHITECTURE IN LONDON.---VII.

By F. HERBERT MANSFORD.

(*Concluded from p. 4, No. 393.*)

THERE is not the same amount of rebuilding going on in South London as in the north, but probably very large areas will be reconstructed during the next twenty years, owing to the lapse of leases. The wide thoroughfares which intersect here in all directions afford splendid opportunities for quick electric locomotion and for the erection of lofty buildings almost unimpeded by restrictions of ancient lights. Electric "tubes" will connect South London more effectively with the north and discount the barrier of the river with its tramless bridges. In Paris even the narrow Seine has confined the chief commerce to the north bank, but Government and university buildings give importance to the south. If Father Thames had taken a straight course from Hammersmith to London Bridge the present sites of the Kensington Museums, Buckingham Palace and Westminster Abbey would be south of the river. Not the buildings, however; they would probably have been further north, for rarely has South London been adorned by any royal or national edifice. When Britten & Pugin published their "Public Edifices of London" in 1828, the Surrey side was represented by Astley's Amphitheatre and Bethlehem Hospital. There were but six bridges across the river below Hammersmith. There are now fourteen road bridges, seven railway bridges, four tunnels and a free ferry; the population of South London has risen to two millions, and a beneficent Government has adorned it with the Brixton Prison for Females and the Government Stores for India. Even the County Council seems to ignore the possibility of reclaiming the foreshore below Westminster Bridge and building itself a riverside palace thereon. Perhaps, wisely; but what a betterment rate could they levy on the neighbourhood for their condescension! South Londoners do possess one of the finest architectural groups of the Metropolis—the buildings of Greenwich Hospital—but they have acquired it only by their own persistent expansion.

As things are, one can enjoy an unwonted amount of sky and sunshine in the main thoroughfares, and the low buildings give prominence to the few important structures in their midst. It is much to be wished that Pugin's design for a hexagonal spire 320ft. high to St. George's Cathedral could be carried out, for it would be seen to great advantage in the neighbourhood and from the opposite side of the Thames.

On the river-bank nearly facing the Tate Gallery is the new portion of Burdett's Bonded Stores, from the design of Mr. Frederick Vigers. It is not a building to attract the notice of an ordinary pedestrian; it displays no ornament; it merely and unaffectedly fulfils its purpose, and is in admirable harmony with its environment of barges and wharves. It calls up reminiscences of the Low Countries on both sides of the North Sea, but not by imitation. The outline of the building is partly dictated by convenience, for it is situated at the junction of a basin and the river, and one corner is boldly rounded to facilitate the movements of the lighters.

The New Belgrave Hospital for Children in the Clapham Road is bright red from pavement to lofty ridge, unrelieved by anything but occasional stone dressings. It consists of an administration block and a north pavilion of superimposed wards; its position on the site suggests that a south pavilion is contemplated for the future. Mr. H. Percy Adams has obtained a striking effect by his masses and piles of simple brickwork. The ventilation and smoke flues are gathered together and carried up in a buttress-like fashion, flanking the walls, and break the ridge of the administrative block in a similarly monumental fashion. Some may consider the shortness of this ridge regrettable, but Mr. Adams appears to have intended to obtain an impression by height, and has consistently emphasized his vertical lines throughout, leaving the horizontal ones unaccentuated. Instead of eaves or cornice, there is a stepping-in of the walls towards the top, the whole building possessing a slightly pyramidical outline, strong and unusual. Spirelets on the flanking towers of the great gable would have relieved the bluntness of these sanitary appendages, but bluntness was apparently intended; and, again, it is scarcely fair to suggest unnecessary features in connection with a hospital design when the elevations tell mutely of economy.

THE NEW BELGRAVE HOSPITAL FOR CHILDREN, CLAPHAM ROAD, S.W.
H. PERCY ADAMS, F.R.I.B.A., ARCHITECT.

THE BISHOP'S HOUSE, KENNINGTON PARK, S.E.

The town residence of the Bishop of Rochester is almost pathetically situated behind the Kennington Theatre. Although so overshadowed, it manages to attain a certain measure of dignity by its quietness and symmetry. It is of a formal Georgian type, with a deep plaster cove at the eaves and a tiled roof broken by frequent dormers. The south elevation is towards Kennington Park, the west faces a gravelled forecourt, and the east a lawn and garden.

The Lambeth Baths revel in a site worthy of a town hall, being situated at the corner of two wide thoroughfares (the Kennington and Lambeth roads) and built back some distance from the pavement. Only South London can offer such sites but a mile distant from Charing Cross. Mr. A. Hessell Tiltman has availed himself of the oppor-

tunity and designed one of the best groups of public baths in London.

The elevation of the station and offices of the London Necropolis Co. in Westminster Bridge Road is ponderous, but scarcely funereal (see p. 140). Were it not for the inscriptions, it might be taken for warehouse and offices of a superior class, instead of a building intimately connected with those periods when the emotions claim expression, if only of quietness and dignified restraint. The large unpolished arch of grey granite carries a superstructure of red brick and buff terra-cotta; the windows have deep reveals, and the whole is crowned with a semicircular pediment, but nowhere is there a suggestion of the very-well-thought-out arrangements and design within, unless we except the pleasing and rather novel use of glazed brickwork visible through the archway of the ground floor.

CHAPEL, OLD KENT ROAD, S.E.
BANISTER FLETCHER AND SONS, ARCHITECTS.

The Library of St. George the Martyr, Southwark, in the Borough Road, is one of the numerous buildings for which we are indebted to the generosity of Mr. Passmore Edwards. In this case Mr. Blomfield Jackson was the architect, and he has provided a modest structure simple in outline and expression. The disposition of reading-room, library and residence are unmistakable, and lie economically compact below one roof. The building comprises an admixture of Gothic and Classic features, of which the traceried panels of the angle piers and the sculpture of the gables are the main points of interest. A flêche would be a gain, for the building is already o'ertopped by most of its neighbours.

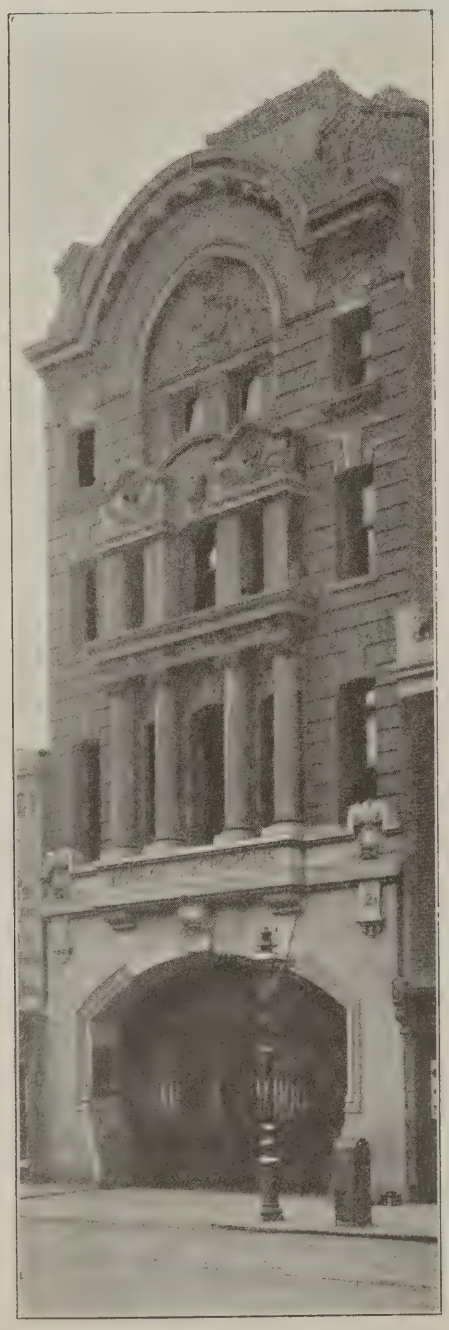
The New Kent Road is the poorer for the destruction of the Paragon, the greater part of which has been pulled down to make way for a board school and two rows of mean houses which, with an unusual regard for aspect, turn backyards towards the main thoroughfare. Some compensation is found opposite, where the St. Olave's and St. Saviour's Grammar School for Girls is approaching completion, a cheerful building of red brickwork roofed with grey-green slates.

A few years ago Nonconformist chapels were almost invariably acutely "Gothic." A complete change has taken place in this respect, and these structures are now often secular in appearance. The façade of such a chapel as

PUBLIC LIBRARY, BOROUGH ROAD, S.E. A. BLOMFIELD JACKSON, A.R.I.B.A., ARCHITECT.

that recently erected in the Old Kent Road reminds one somewhat of a corn exchange in a provincial town. It is, perhaps, difficult without the sculptor's aid to express the religious aim of a meeting-house as distinct from a church where the service would be of a liturgical character. In this instance the triple darknesses of the open arches and the frank expression of the structure within could hardly fail to produce a pleasing elevation, but it is a question whether the bringing forward of the gable upon the columns, thus adding to their function and deepening the setting of the window, would not have been an improvement.

On a small island site at the junction of Tooley Street and the Tower Bridge Approach is a branch of the London and County Bank from the designs of Mr. W. Campbell Jones (see next page). Each of its three elevations presents a pediment of different size, but carrying a similar bold cornice; below are two tiers of windows with coupled pilasters at the angles upon a ground storey of stone. Notwithstanding the rather unsuitable plinth of small random rubble and the use of false balusters as panel decorations, the whole structure is pleasing in effect. The iron framing below the dome is frankly shown and suggests a half-iron construction that may take the place of half-timber work, if only some absolutely fire- and heat-proof paint could be discovered.



Few parts of London have been so distinctly improved within recent years as this corner of Bermondsey. The vista of the new southern approach road is terminated by the somewhat theatrical but still imposing archways of the Tower Bridge, while to the left Mr. Mountford's Grammar School buildings are well seen in all their fine colouring of mellowed brickwork and weathered Portland stone. A short distance westward in Tooley Street is the distillery of Messrs. Boord & Son (see p. 141), a building faced with picked yellow stocks and stone and red-brick dressings. The offices lie compact between circular turrets bound together by a string-course, becoming a cornice in the interval. These turrets, the entrance doorway, and the quality of the brickwork invest the structure with distinction even among bulky neighbours.

In these critical articles distinct buildings only have been considered, and no attempt has been made to generalize on the architecture of streets as a whole. Yet the study of the one leads on to, and is indeed incom-

ENTRANCE TO LIBRARY.

plete without, the other; and it is scarcely possible for an architectural student to traverse the thoroughfares of a modern city without it being impressed upon him that at no earlier period of the world's history have streets so appallingly mean and ugly been possible. Not that even most London streets are deserving of such epithets—a capital necessarily possesses so many architectural advantages over a provincial town. Cardiff and Hull are instances where the beauty is mainly a heritage of earlier times; Middlesbrough lacks even that endowment; but London possesses miles upon miles of dreary streets not only in the suburban districts but in those more central regions where factories and warehouses predominate—streets utterly devoid of charm except under occasional atmospheric conditions of mist or sunset glow. A hundred years ago factories and warehouses were never so repugnant, if only because they were lower and less crowded together. And there was generally a residence attached which lent some charm of greenery to the place, and the sun could penetrate most of the windows. Now, however, we often find pile upon pile of the coarsest brickwork erected with almost cynical indifference to mental health, and only so much consideration for bodily needs as the Building Act enforces.

LONDON AND COUNTY BANK, TOOLEY STREET, S.E.
W. CAMPBELL JONES, A.R.I.B.A., ARCHITECT.

Is there a remedy for this state of things? Various suggestions have been made from time to time at the Royal Institute of British Architects and in books and journals dealing with the reconstruction of large towns. Paris is generally quoted in this connection, and even if the streets of that city strike us as somewhat monotonous and devoid of individual character as compared with our own, there are points of administration as practised there which we might surely adopt with advantage.

Mr. Arthur Causton, F.R.I.B.A., in his book on "London Improvements" wrote that —"In order that the Prefect of the Seine may be able to secure independent technical advice on architectural questions a standing council composed of experts is attached to the Prefecture and summoned as occasion requires. Thus it happens that when, at length, an improvement scheme is submitted to the Prefect, Paris can rely that his consent is fortified by the opinions of the leading architects of the country. That Parisian architects become thoroughly competent for the work that is required of them is insured by the excellent higher education provided by the municipality, and by the yearly expenditure of a moderate but regular sum for the promotion of fine arts, by means of purchase under a competitive system of designs for public buildings, and for other artistic works. This not only educates the popular taste but adds to the beauty and adornment of the city."

A few years ago, on the completion of the Rue Réamur, a jury of four architects and five municipal councillors awarded six gold medals to the architects, and remitted half the street dues to the owners of the six best designed façades in the new thoroughfare.

This "Concours des Façades" has become a recognised institution in Paris, and has been instituted lately in Marseilles. Few things appeal so much to the owners of buildings as a reduction of the rates, and certainly nothing gratifies an artist so much as the encouraging appreciation, or even only the interest, of his contemporaries. On this last ground, the writer hopes his remarks may not have been considered superfluous, even by those who may disagree with them.

Correspondence.

"A Groined Vault."

To the Editor of THE BUILDERS' JOURNAL.

MANCHESTER.

SIR,—Referring to the drawing of a groined vault published as a centre-plate in your issue for October 1st, should not the rise of the rib v v be 7in. lower than it is given?—Yours truly, F. SUTCLIFFE.

[The mistake to which you draw attention was not discovered till the block had been made, and it was not possible to alter it then. You will see, however, that the error is corrected in the explanation of the drawing given on p. 114 of the issue in question.—ED. B. J.]

S. AFRICA FOR ARCHITECTS' ASSISTANTS.

SALARIES AND COST OF LIVING.

A CERTAIN South African firm who, owing to the nature of their business, are brought into close touch with architects and the building trade in South Africa inform us that they can safely say there are many openings for good men in architects' offices. "The building trade in South Africa is exceedingly brisk at the present time, more particularly we think in Natal, and, of course, when normal conditions again occur in the Transvaal Johannesburg will provide many opportunites for architects' assistants. As it is probable that you will be receiving many enquiries on these matters, a few particulars may be of service.

Natal.

"In Natal salaries for architects' assistants range from £15 to £25 per month, according to qualifications and ability. Office hours are, generally speaking, from 9 a.m. to 5 p.m., with Saturday as a half-day; overtime and night work, which are sometimes necessary, are remunerated at discretion, but in many cases the monthly salary is considered to cover this, and is generally taken into account on making an engagement.

"Board and lodging cost about £8 per month.

"Durban, of course, is the business centre of the colony, the only other town of importance being Pietermaritzburg, the capital of the colony and seat of government. The climate, generally speaking, is considered healthy.

Johannesburg.

"As regards Johannesburg, under normal conditions the same remarks apply, excepting that the cost of living is considerably higher, and wages in proportion. For instance, board and lodging may be reckoned at about £12 per month and salaries from £20 to £40. The climate is considered to be better than that of Natal.

"It is not wise, however, for any man to enter South Africa (unless he has an appointment to come to) without having some funds to enable him to keep himself until such time as he finds employment, but our experience has been that good competent men never find any difficulty in obtaining situations."

Readers will find it interesting to refer back to the BUILDERS' JOURNAL for March 7th, 1900, in which issue a long article was published on "Johannesburg; before and after the War," by Mr. John Begg: and reference might also be made to the leaderette, by the same writer, in the issue for September 12th, 1900. With the aid of this information and that given above a very fair estimate can be formed of the possibilities of architectural and similar work in the new South African colonies.

Architecture in the Transvaal.

At the last meeting of the Transvaal Association of Architects, Ltd., in Johannesburg, an interesting address was delivered by Mr. E. B. J. Knox, the president. After referring to his connection with architecture in South Africa, which dates back to 1875, Mr. Knox alluded to the discovery of the Witwatersrand and the type of building then fashionable. "The first I can remember," he said, "was a reed hut, rapidly to be succeeded by a tin structure of more or less pretentious dimensions. Then came the mud-brick structure, the first of which was quite recently standing near the Ferreira mine, and is probably there still. The outer walls of this building are gorgeously supported with large stone and mud buttresses to prevent their tumbling out. This edifice was the locus of no less an institution than the Standard Bank. From that period building went forward in leaps and bounds, and when it is remembered that all the material excepting the stone and slop-bricks had to be brought by ox-waggon 400 miles or so, it is astonishing to observe the enormous number and size of the buildings that were erected in those days, some of which presented passable architectural treatment. On the approach of the railway to Johannesburg and Pretoria (making it possible to obtain superior materials for construction), and the development of the brick, lime, cement and stone industries, a new era in architectural life set in, resulting in the substantial piles of town buildings and innumerable suburban residences which we saw around us at the outbreak of the war. We are now, however, I feel assured, entering upon a fourth epoch in our history of building, which will call forth the best knowledge and experience in our profession to adequately deal with. Under the protection of the British flag there will be no uncertainty as to the security of tenure or like investment, and capital will flow into the country, not only for the purpose of multiplying the areas of our townships, but of replacing most of our effete and decrepit buildings with structures worthy of the coming age."

In conclusion, Mr. Knox uttered a word of warning to his fellow members in regard to ill-advised outside decoration, which might well be laid to heart in this country. "We should ever bear in mind," he said, "that whereas the doctor buries his mistakes, the architect erects them into ghastly monuments to haunt posterity."

DISTILLERY OFFICES, TOOLEY STREET, S.E. ASTON WEBB, A.R.A., ARCHITECT.

LONDON COUNTY COUNCIL.

THE YEAR'S WORK.

THE London County Council reassembled last week after the usual summer recess. The chairman, Sir J. McDougall, in the course of his annual address on the work of the Council, said that at the close of the year the Finance Committee was relieved of the duty, entrusted to it five years ago, of exercising financial control over the Works Department, as the Council decided to reconstitute a Works Committee, to which was now referred the carrying into execution of all works by direct employment of labour. During the year this department executed work to the amount of £411,411, and a statement of works completed during the year ended March 31st last, showed, in the case of estimated works, a balance of cost above final estimate of £7,200, and in the case of jobbing works a balance of cost below schedule value of £980.

Main Drainage: Some Figures.

The Main Drainage Committee supervised and advised the Council on the all-important work incidental to the disposal of the sewage and main drainage from an area of 140½ square miles, with a population of 5,137,435 persons. The magnitude of the work might be judged from the fact that 85,595 millions of gallons of crude sewage were chemically treated at the precipitation works last year.

B

This enormous volume represented an average flow of nearly 235 millions of gallons every day. The quantity of sludge taken to sea was the largest on record for any one year, and amounted to 2,479,000 tons, or nearly 48,000 tons a week. The nett maintenance expenditure was £246,694, which was equivalent to a rate of 1·63 in the £, while the outlay on capital account amounted to £175,920.

The growth of the population of London since the establishment of the main drainage system about forty-five years ago had, however, made it incumbent upon the Council to take measures for providing additional main sewer accommodation, and the special feature of the year's work had been the progress of the extension of the system. The expenditure voted by the Council previously to March 31st in respect of the scheme amounted to £1,263,000, but the final completion of the scheme, including the construction of large intercepting sewers from east to west of London and the provision of additional machinery at pumping stations, involved an estimated expenditure of £2,947,000. As a result of the Council's action in dealing with the sewage the condition of the Thames had so greatly improved as to encourage the Salmon Association to begin a series of experiments with a view to the reintroduction of salmon into the river.

Tunnels and Bridges.

The Bridges Committee had continued the care of the bridges, ferries and tunnels belonging to the Council. Blackwall Tunnel had been used during last year by double the amount of the traffic in 1898. In consequence of a settlement at the electric-lighting station necessitating repairs to the value of £3,700, the current for lighting the tunnel had been supplied for some months past by the Poplar Borough Council. The work connected with the Greenwich Tunnel had made considerable progress, and would probably be completed this month. The Thames Tunnel Act, 1900, empowered the Council to construct a tunnel under the Thames from Rotherhithe to Ratcliff. The scheme was being steadily advanced, about £77,000 having been expended in the acquisition of property. It was expected that the drawings for the construction of the tunnel would be completed by the end of the year, and the contract let in the early part of 1903. The total length of the tunnel would be 6,825ft., or about 1¼ miles, and the external diameter would be 30ft. (3ft. wider than the Blackwall Tunnel) — sufficient to obtain a carriageway of 17ft. in width and two footways each 4ft. 2in. wide. Vauxhall Bridge, so far as the work of reconstructing the piers and abutments was concerned, was rapidly approaching completion, and it was hoped that matters might be sufficiently advanced to let the contract for the superstructure in the early part of next year.

Street Improvements.

The Improvements Committee carried through the Council four important schemes, the nett cost of which was estimated at £462,552. These four schemes included the widening of Hampstead Road at the southern end, which would cost £225,500, of which the St. Pancras Borough Council would contribute one-eighth, and the widening of certain long lines of thoroughfare in Fulham, Deptford, Camberwell and Lambeth in connection with proposals to construct tramways, the local authorities concerned contributing part of the cost of the street widenings.

During the year one important improvement was completed—the construction of Tower Bridge Road, which formed the principal southern approach to the Tower Bridge from Old Kent Road.

Considerable progress had been made with the thirty-three schemes in course of execution. Of these the two most important were the new street from Holborn to the Strand and what was known as the "Westminster improvement scheme." For the Holborn-Strand improvement it was necessary to acquire property involving an expenditure approaching £5,000,000, but it was anticipated that the nett cost, after obtaining recoupment by disposal of the surplus land, would ultimately not exceed £774,000.

The Widening of Piccadilly.

Another improvement which demanded some notice was that of widening Piccadilly. The portion of the thoroughfare between Hyde Park Corner and Down Street had been widened by the Council upon the suggestion of the First Commissioner of Works. With regard to the portion of Piccadilly near the Circus, again and again the Commissioners of Woods and Forests (the freeholders of nearly the whole of the property on the north side of Piccadilly between the Circus and Sackville Street) had been urged, before granting new leases or renewing existing ones, to give the Council an opportunity of acquiring at reasonable cost the strip of freehold land needed for the widening, but the Commissioners had as yet not seen their way to assist the Council, and it would appear, therefore, that for the present the Council was precluded from carrying out the scheme.

Housing.

During the year undertakings were entered into which would involve a total expenditure of about £65,000 in respect of land and about £600,000 in respect of buildings and other works. There had been considerable difficulty in past years in providing accommodation for persons of the working classes without incurring to a slight extent a charge upon the rates. The committee now found itself in the position, after paying interest and capital charges, of having a small balance remaining to the credit of the Council. This result had been achieved by the strict economy of its staff and by the fact of having a housing manager to watch the outgoings with the greatest care. Good progress has been made with the development of the Totterdown Fields estate, Tooting, where cottages might be expected to be ready for letting in the late autumn. A new estate at Old Oak Common Lane, Hammersmith, had also been purchased. This estate was within the county, and its 50 acres would afford accommodation for about 9,200 persons. The Council had now about 348 acres of land acquired for "housing" purposes, at a cost of £217,000, and upon this land dwellings, chiefly cottages, for about 68,000 persons had been, were being, or would be built at a cost of nearly £3,000,000.

No Balconies in Narrow Streets.

The Building Act Committee recommended that the Council, in the exercise of its powers under section 73 of the London Building Act, 1894, should not consent to the erection of balconies at the second, third and fourth-floor levels of proposed premises for the Clerical, Medical and General Life Assurance Society, No. 1, King William Street, to overhang the public way of King William Street and St. Swithin's Lane, as, having regard to the narrowness of St. Swithin's Lane and the height of the proposed building, it was considered undesirable to sanction the erection of the intended balconies. This was agreed to.

Gangway Across Water Street.

The Building Act Committee recommended, and it was agreed, that the Council, in the exercise of its powers under sections 13, 73 and 82 of the London Building Act, 1894, but in no way otherwise than under such sections, should consent to the erection of an open iron and concrete gangway across Water Street, to connect warehouses on the east and west sides of that street.

THE ARCHITECTURE OF TO-DAY.

MR. ALFRED DARBYSHIRE, president for a second year of the Manchester Society of Architects, delivered the opening address of the session on Thursday last. He alluded to the establishment of a Chair of Architecture at Owens College. They were surrounded in Manchester, he said, with evidences of want of advice and control, as witness the architectural settings of their public statues and the artistic horrors and heraldic blunders made in the decorative efforts (including the Civic Hall) at a coronation time, or on other occasions of public rejoicing. There were many ways in which the knowledge and culture of a Professor of Architecture at the University would be of great value without in any way conflicting with the official control of the city architect. After dealing with architectural competitions and the need for proper and efficient assessment, Mr. Darbyshire spoke of the present development and practice of architecture and the probable condition of the art during the first quarter of the twentieth century. A fit and proper motto for the present condition of civilisation and movement was "Speed." This unseemly speed and competition had engendered a utilitarian spirit which dominated all city architecture. If a beautiful and refined façade were produced its lines and its architectural beauties were ruined and destroyed by huge signboards in the form of cut-out flaring gilt letters stuck on the elevation.

Speaking of science, let them consider what electricity was doing in the way of destruction of city architecture. Holdfasts for overhead wires were driven into and fixed on architectural façades without the slightest consideration for their artistic value. It was a matter of no consequence as to whether the buildings were public or private, and perhaps no greater instance of the hasty application of scientific requirements to the spoliation of architecture could be found than the present aspect of Albert Square, Manchester. It was a mass of electrical network. The fine elevations of Waterhouse were completely cut to pieces, and their beautiful lines destroyed.

The modern historian who wrote the chronicle of our own time would have to recognise a topsy-turvydom unknown in the world's history. England, after its past centuries of consolidation in art, literature and intellectuality, was now going at the speed which characterised the building up of the new Western world, whereas America was now consolidating in the realms of art, literature and intellectual culture. On this side of the Atlantic we did not hesitate to spoil our heart with the hideous application of scientific necessities. There was little respect for existing beauty. We even went to such lengths as painting white marble statues—and, he regretted to say it, in their own city too—although they were recognised as the works of great sculptors of byegone days.

Briefly, the architect of this new century had a condition of things to grapple with which would militate against the principles of beauty in architecture: and without beauty architecture became mere building, and only the exponent of science. It was a matter for serious consideration as to how their architects were to face this new condition of English civilisation. The struggle between the commercial and the beautiful would be fierce and its issue doubtful. They could only hope that under whatever new conditions and requirements architects would have to work they would, like the grand old Greeks, still love the beautiful, and so help to maintain through the coming ages the prestige of our Great Empire.

THE CRACKS OF VENICE.

A Special Correspondent's Report.

THE following are some extracts from a long report on "The Cracks of Venice," by a special correspondent, published in the "Morning Post" for October 7th:—

St. Mark's.

Accurate examination has led to the discovery of many minor defects and some important signs of decay. The bronze horses facing the Piazza must come down and be repaired. The mosaics of the Arch of the Apocalypse must also come down in order to admit of repairs to the framework of the arch itself. The exact extent of the damage is not yet known, but there is a long ugly crack in the mosaic at the centre of the arch, while the further end seems to be warped or forced downwards through some unexplained cause. Evidently the whole of it has moved, for the large window by which it is lighted has been dragged inwards to a distance of 6in. or 7in. From the galleries which run round the interior of the basilica it is easy to notice that other arches and cornices have sunk from their original positions, but these movements, like those of the pavement below, are not thought to be dangerous. Plans for a thorough overhauling of the basilica have been submitted to the Government, and within a few weeks Signor Manfredi, the new chief architect, hopes to be at work on the Arch of the Apocalypse.

The Doges' Palace.

As regards the Palace of the Doges, ordinary visitors will notice nothing remarkable except the remains of the Campanile arranged in the courtyard until they come to the great Council Hall. Here the species of wooden platform below Tintoretto's "Paradiso" has been moved from the wall, with the result that a number of cracks are disclosed in the wall itself. Some of these fissures run upwards beneath the boarding on which the canvas is stretched. Both boarding and canvas are to be moved, so that the wall may be carefully examined and strengthened. . . . . It is as yet uncertain whether the cracks in the wall behind the "Paradiso" are isolated signs of decay or are the effect of a general movement in the corner of the palace which contained the St. Mark's Library. It has frequently been said that the weight of the library was ruining the building and that the books ought at once to be removed to another spot . . . but it is a question whether the damage . . . is attributable solely to the weight of the books, or is a direct result of imprudent "improvements." The worst of these "improvements" was the making of a large perpendicular aperture in one of the principal internal walls in order to make room for a book-lift to save the librarians the labour of walking up and down stairs. Apart from the folly of cutting away a substantial part of such a wall, the operation itself must have shaken the building to its foundations. . . . . As a direct result of this proceeding the eastern wall of the palace, opposite the prisons, is beginning to bulge out, and the portion of the mutilated internal structure between the aperture and the eastern wall shows half a dozen long slanting cracks. On a wall thus weakened the weight of the books may well have had a serious effect, and the regional office has done well to empty all the shelves in the rooms concerned.

The Patched Mint.

The books . . . . will find a new home on the other side of the Piazzetta in the Palazzo della Zecca, or Mint. . . . "The Venetians are great patchers," a British resident in Venice recently remarked as he walked through the Zecca, "but I doubt if their genius for patching ever had such an opportunity before." The ground floor is comparatively secure, but the second and third are in such a state that one fears for his safety while he scrambles through the tumble-down passages. In more than one place the sky is visible between wall and ceiling; the body of the building seems anxious to go to the left and the western wall to the right. The place has been patched and restored out of all likeness to its former self by previous operators, but still the civil engineers seem to think it a fit subject for their skill. The climax of their scheme is to pack away the books in narrow and badly-lighted chambers surrounding the courtyard, and to turn the yard itself—built of stone in late Renaissance style—into the general public reading hall. The floor of the courtyard is not much above water level. It has a fine large well in the centre, surmounted by a marble head and a large iron pulley. This well it is proposed to leave intact. The courtyard is to be surrounded with a cornice and roofed over with glass, an arrangement which will effectually prevent the damp air of the well from escaping, and will still further darken the rooms in which the books are to be put. The beauty of this project will be apparent when it is considered that it is not necessary to turn the courtyard into a reading-room at all. Any library architect "worth his salt" would see the need of placing the large rooms overlooking the lagoon at the disposal of the reading public, and of assuring space, light and air for the books by amalgamating the two upper storeys and rendering the volumes accessible by galleries with glass floors as in the French Bibliothèque Nationale. The director and his staff, for whose benefit it is proposed to sacrifice the large front rooms, might find ample accommodation in any corner of the Palace.

The Old Procuratie,

or Colonnade, on the north side of the Piazza San Marco, has caused the regional office considerable anxiety. Some of the columns were found to be detached from the arches which they were supposed to support, and some of the arches were seen to be cracked and unsound. As the beauty of the Piazza is bound up with the preservation of this characteristic structure, steps were at once taken to prevent disaster. The rooms above the damaged arches, which had been filled with weighty goods by the shopkeepers who occupy the ground floor, were evacuated and propped up pending arrangements for proper repairs. There should be no great difficulty in restoring the Procuratie to a condition of perfect stability, but they will require to be watched much more closely than they have been in the past.

Sta. Maria Gloriosa dei Frari.

This great church tends unmistakably to fall asunder, as a result of the subsidence of the walls. The movement is more noticeable on the left than on the right, for on the left the massive Campanile has sunk at least 30 centimetres (about 1ft.) and has pulled outwards and downwards the portion of the transept and nave attached to it. Professor Ongaro . . . believes it possible to stop the movement by driving piles into the subsoil. . . . When this has been done some means must be found of bracing together the two sides of the nave so as to stop the splitting tendency. The work will be long and costly, but a good beginning has already been made, and there is no reason to doubt its successful completion.

The Damage at SS. Giovanni e Paolo

is still more evident and is more difficult to repair. In the first place, the architecture seems faulty, inasmuch as the walls run to a height of at least 80ft. without buttresses or other supports. . . . The nave is supported by ten huge columns. Former restorers have attempted to brace the nave together by transverse beams. One of these beams is now found to have snapped under the strain put on it by the subsidence and displacement of the walls. Other signs of dangerous movement in the masonry are only too apparent. . . . At the right end of the transept the wall has been so weakened by the removal of blocks of stone in order to make room for new shrines that it threatens to fall outwards. The great window on this side of the transept is being taken down so as to facilitate the restoration of the wall, and the offending shrines have been removed in order that their places may be taken by fresh masses of supporting masonry. But it is at the left end of the transept that the subsidence is most alarming. From the choir to the left corner of the transept the pavement slopes down so rapidly as to give one the sensation of walking down hill. The wall seems to have been weakened by the cutting away of masonry, and, like the opposite wall, threatens to fall outwards. How marked this tendency is can best be seen from the shape of the great corner column at the angle of the nave and the transept. From the pavement to a height of about 40ft. the column is straight, but near the capital it bulges out, and above the capital the arch resting on it bends in. The dimensions of the church are so great and the appearance of the architecture so light that it is hard to imagine how the masonry can be sufficiently strengthened without disfiguring the place, if, indeed, some disaster does not occur before the repairs can be effected.

Writing to the "Morning Post," Mr. George Wemyss says: "I allude to the steamer. When Venice, to the great Ruskin's horror, sanctioned the innovation of this desecrating craft on her silent waterways, she pronounced her own doom. . . . To make navigation practicable, therefore, for the steamer the dredger had to be employed. . . . The dredger set up under the sea among the ancient piles on which Venice stands a deadly but subtle process of disintegration—a process which has been silently continuing ever since. You cannot deal with sand as you can deal with mud or clay. You cannot take one grain of sand from a heap and not see that heap slip slowly back till that minute void has been filled up. . . ."

R.I.B.A. PROGRAMME.

THE following papers have been arranged for the forthcoming session of the Royal Institute of British Architects:—The opening meeting will be on Monday, November 3rd, when Mr. Aston Webb, A.R.A., will deliver his presidential address. On November 17th Mr. F. C. Penrose, F.R.S., Litt.D., will read a paper on "The Drawing of the Ionic Volute," and Dr. A. S. Murray, LL.D., will give a "A Note on a Fragment of the Parthenon Frieze." On December 15th Mr. Arthur Evans will give a paper on "The Palace of Knossos, Crete." At the meeting on January 19th the award of prizes and studentships will be announced, and a paper on "Science Workshops for Schools and Colleges" read by Prof. H. E. Armstrong. On February 2nd the president will deliver his address to the students and present the prizes. On February 16th Mr. Basil Champneys will read a paper on "College Planning," and on March 16th Mr. Charles Hadfield one on "Westminster Cathedral." On March 30th Mr. Horatio Porter will read a paper on "Fire Prevention," and the report by the Science Committee on the Fire Offices Regulations will be received. Mr. Edwin T. Hall will read a paper on April 20th, and the annual general meeting will be held on May 4th. On May 18th Sir Martin Conway will deal with "The Formation of the Ancient Style of Egyptian Architecture," and on June 22nd the Royal Gold Medal will be presented.

ROME ON THE STAGE.

MR. BEERBOHM TREE has so often gratified his patrons with costly and elaborate stage settings, that it is almost superfluous to say that the stage pictures in the production of "The Eternal City" at His Majesty's Theatre are quite up to the standard of this house for beauty and exactitude. We are aware that many critical people object to an elaborate *mise-en-scene* on the ground that it detracts attention from the play. Such a point, even if it were within our province, is too debatable to compass here; but it can at least be urged that a costly setting should have the crowning merit of accuracy.

In some respects the scenery provided by Messrs. W. Telbin and Joseph Hacker is better than in Mr. Tree's previous productions. The ancient and time-scarred walls of Rome have an appearance of genuine antiquity; the interiors do not seem to be fresh from the decorator's hands; and above all the atmosphere and colour of the Roman sky have been most realistically portrayed. But the struggle between stage requirements and truthful representation is clearly visible in several scenes, and notably in the first, "The Loggia of the Palace of Baron Bonelli," situated apparently at the Vatican end of the Borgo S. Angelo, overlooking the Piazza di San Pietro—a curious situation, indeed, for an ambitious and unscrupulous Premier who has scant respect or consideration for his venerable neighbour.

The loggia itself is but a roofed-in space between two wings of the palace, supported by columns on its open side, the whole of a severe Palladian type; but beyond it and fronting the building is a curious colonnade supported by coupled columns of a pronounced Romanesque type, showing plain and wreathed alternately on the façade. To reach this colonnade, which apparently runs round the building, one has to ascend three or four steps from the loggia proper, a proceeding that may be effective from a dramatic point of view but is exceedingly awkward when one considers the other rooms opening on to the colonnade.

David Rossi's apartments (Act 1, sc. 2), a hall in the Castle of S. Angelo (Act 3, sc. 2), a simple vaulted chamber, richly coloured, and the ante-room to the Pope's bed-chamber (Act 5, sc. 1) call for no comment. The gardens of the Vatican (Act 3, sc. 2) enable Mr. Telbin to realise a very beautiful distant view of the Vatican and St. Peter's without the trammels of dramatic necessity. Mr. Tree is also enabled to give an accurate representation of the curiously mediæval Papal ceremonial and etiquette which will surround the future Pontiff.

The studio of Roma Volonna, situated (in the play) on the lower slope of the Palatine Hill, serves as the scene for Acts 2 and 4. It is a lofty room, richly decorated in coloured marbles. On the side facing the audience is a large semicircular arch supported by cippollino coupled columns in antis; through the arch one looks down over sloping gardens upon the Colosseum. The use of coupled columns makes the wall unnecessarily thick, and the closing of this side of the room at night by electrically-worked shutters is unconvincing. We are told that the action of the play is in the future; certainly such a method of building is hardly justified by the winter temperature of Rome at present. In the soffit of the arch is a wrought-iron grille of rather pleasing design.

The last scene of the play—the loggia of the Castle of S. Angelo—is perhaps the least satisfactory. One cannot understand why the heroine, accused of murder—an ordinary crime, unfortunately — is under military guard in such a place. The view seen from the castle is not recognisable, and Hadrian's Mausoleum has disappeared. The only object of the scene seems to be the introduction of the disused passage of Pope Alexander VI. which is made use of by the Pope Pius X. of the play for the purpose of secretly visiting the heroine. But these few faults are more than atoned for by the general excellence of the rest of the scenery.

A.A. OF IRELAND.

PRESIDENT'S ADDRESS.

THE first general meeting this session of the Architectural Association of Ireland was held at Dublin on October 7th. Mr. F. G. Hicks, president, occupied the chair. Mr. Beckett, one of the hon. secretaries, read the annual report, in which it was noted with regret that the attendance at the classes last year was not all that could have been desired. In membership and finances the Association was in a satisfactory condition.

The prizes won during the past session were distributed by the president to the following successful competitors:—Institute prize, Mr. John Knox Vinycomb; Doolin prize, Mr. John Knox Vinycomb; Beckett prize, Mr. F. H. Tallan. Class of Design: first prize, Mr. F. H. Tallan; second prize, Mr. G. Hamilton Barlee.

The president then delivered his inaugural address. After referring with regret to the death of Mr. Walter Doolin, he said his remarks that evening would be chiefly addressed to the youngest members, for whom, indeed, the Association was primarily conducted.

Architectural Education: A Comparison between London and Dublin.

The education of students in the past had been practically nil; even now it was of a more or less haphazard and imperfect description, and the chief object of the Association was to promote and afford facilities for the study of architecture. The report to which they had listened was not, to his mind, as satisfactory as it should be, and it showed distinct evidence of waning enthusiasm not only in the attendance at ordinary meetings but also at the classes and in the competitions. Was it that the students had not realised what was chiefly required of an architect all through his life—self-denial and hard work and study; or was it that there was something wrong with their system of education? Possibly both these elements were at the root of the evil.

It took the London Association fifty years to discover that their educational system was not all that could be desired, and a revolution resulted in their present apparently complete and up-to-date system. The Irish Association had difficulties to contend with that they knew nothing of in London. Their little roll of 131 members, compared with London's 1,400, seemed ridiculously small, and any falling off in classes or meetings was at once apparent. Their very scarcity of members behoved each one to do his utmost to make their teaching a credit to Dublin in particular and Ireland in general.

An Aimless System.

One of the chief defects in their system was that it was practically aimless. They commenced each session with exactly the same kind of subjects, advanced a certain distance, and then stopped, except perhaps in the architectural history class. This was, to his mind, wrong. A student could not be expected to learn all there was to know about a subject in one session, and they could not expect him to go over the same ground year after year. If they were to be of any real benefit as an educational body they must formulate a proper curriculum of study spreading over two or three sessions, and at the end let there be a test as to what a man had learned. They could hardly grant diplomas, but something in the nature of a certificate might be given. He believed they should have qualifying examinations for candidates seeking admission to the Association.

The Decadence of Irish Architecture.

In his opinion the low state to which architecture as an art had sunk in Ireland was due in a great measure to the apathy of the Institute. The old architects formerly had not to contend with their difficulties. Such evils as the lowest estimate or completion within three months under a penalty were unknown. Let them study these old masters and get into their systems, so to speak, some of the poetry and imagination that inspired them.

One looked with sorrow at the ravages caused by the jerry-builder, and he regretted to say there were jerry-architects quite as much to blame. Ground landlords and corporations when granting building leases had the matter in their own hands, and it was often painful to see the utter indifference they displayed with regard to the design of buildings to be erected on important sites.

Reverting to the system of education, he thought their teaching staff was the weak point. Some slight changes were proposed during the coming session in the building construction class and that for the study of architectural history. Single responsible lecturers would conduct the course throughout the session instead of the group of instructors as hitherto. A very necessary addition to their system was a studio where students both young and old could meet at all times and work out their exercises and so forth. A studio would be hardly possible until they got premises of their own, and the sooner they faced that problem again and overcame it the better.

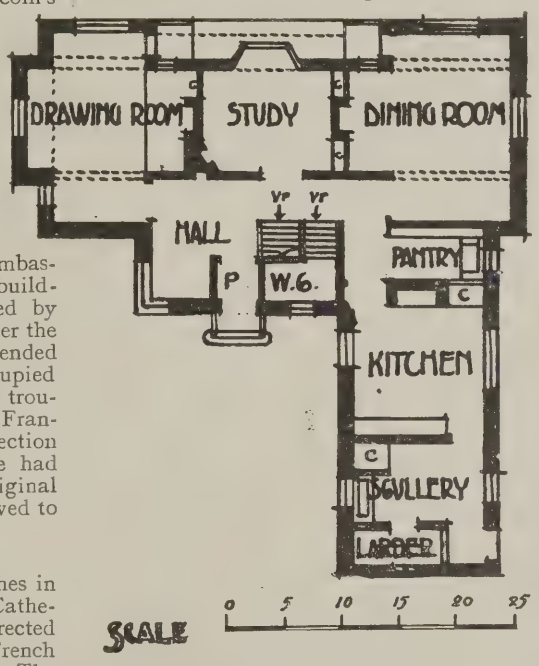
Sketching; Measuring; Construction; Design.

He regretted exceedingly there was no competition for the A.A. travelling studentship last session, to his mind the most valuable of all the prizes offered by the Association. If the young members for whom the prize was reserved only knew the value sketching and measuring old work would be to them in the future they would one and all compete. Too much attention could not be given to sketching, and a student (or a full-grown architect for that matter) should never go out without a sketch-book. Water-colour drawing from nature was an art all architects should be accomplished in—yet how many of them were? The crowning feature of an architect's education and the goal of his ambitions was design. Too much attention was paid to design in the early stages of a student's career, and other subjects were neglected without a thorough knowledge of which design was practically impossible. What was wanted to qualify them as good assistants was a thorough knowledge of construction, ornament and detail, and good and careful draughtsmanship.

Mr. C. J. M'Carthy, in proposing a vote of thanks, said their president was one of the rising architects, and his connection with the Association was sure to bring credit to it in every way. He might mention that out of eight competitors Mr. Hicks had been selected to design the new market which Lord Iveagh was about to build at his own expense and which he intended to present to the citizens. As one of the assessors he (Mr. M'Carthy) desired to congratulate Mr. Hicks on his success. Architectural education in Dublin was sadly neglected, and required immediate attention. He thought the new Department of Agriculture might be able to do something in this direction. If a technical school for commercial education could be started under the department in Rathmines, he thought many of the subjects with which architects were supposed to be acquainted should also be taught in the same way. Mr. G. P. Sheridan seconded the vote of thanks, which was passed, and the president having replied the proceedings terminated.

Bricks and Mortar.

Aphorism for the Week.



My definition of a work of art would be . . . a corner of creation seen through a temperament . . Art is a negation of society, an affirmation of the individual, outside all rules and all social necessities.—Emile Zola.

Our Plates. Aldershot Vicarage is built of red bricks with a tiled roof; the bays are of Portland stone. It replaces a house which was too small for the parish, and which was in a dilapidated condition. It stands in an old garden, and is backed by some fine beech trees. The builders were Messrs. Martin, Wells & Co., of Aldershot. Mr. Charles Spooner, of Holford, Bridgewater (and 17, Red Lion Square, W.C.), was the architect. The drawing was exhibited at this year's Royal Academy.—The view of Ghyll Cottage, Goudhurst, Kent, is taken from the garden side. Plans, &c., of the cottage were given in our issue for April 17th, 1901. The drawings were made for a selected site level in itself, but high up and commanding an extensive view. Compactness and strict economy were required and local materials only were to be used. Difficulties about water supply that existed at that time eventually caused the abandonment of the scheme.

Chapel of the Sardinian Ambassador. The Roman Catholic Church of Saints Anselm and Cecilia, in Sardinia Street, Lincoln's Inn Fields, is to disappear for the new Holborn-Strand street now making steady advance in that direction. The church is one of the oldest Roman Catholic churches in London. The church when originally founded was attached to the residence of the Sardinian Ambassador, on the west side of Lincoln's Inn Fields, and the only way into it led through his house. In the Gordon Riots of 1780 the house of the Ambassador and this chapel were the first buildings attacked and partially destroyed by the mob. The church was rebuilt after the riots had been suppressed, and was extended westward over the ground formerly occupied by the Ambassador's stables, and in the troublous times of James II. a body of Franciscan Friars was established in connection with it. Inigo Jones is said to have had a hand in the designing of the original church, and the sanctuary of it is believed to be the remains of his work.

Frescoes Destroyed at Moscow. One of the finest churches in Russia is the Moscow "Cathedral of the Saviour," erected to commemorate the expulsion of the French in 1812, and only consecrated in 1883. The interior walls of the sort of cloister which surrounds the whole edifice are panelled with huge marble slabs bearing the names of all the officers and the regiments, squadrons, sotnias, &c., engaged in the campaigns of 1812 and later in the Napoleonic wars. The upper walls of the cathedral and the entire space behind the magnificent altar are covered with frescoes illustrative of the history of the Russo-Greek Church and scenes from the Gospels. A sensation has been caused by the discovery that a very large proportion of these splendid frescoes are rapidly decaying. The picture by Semiradskiy, in a semicircular niche behind the high altar, which represented the "Last Supper," and was the chief glory of the cathedral decorations, has entirely disappeared, and its place is taken by a copper or brass panelling, upon which a new picture will be painted. According to the accounts of experts who have examined the frescoes, a similar fate awaits the entire series at no distant date. It appears that, instead of being painted on the prepared face of the solid wall, a curious device was adopted to get a surface for the artist. Light metal network screens were bolted on to the walls, leaving an appreciable interstice, and upon these the fresco-face for the painter was prepared. What has been going on in the interstices behind the pictures does not seem quite clear. But behind the destroyed fresco of the "Last Supper" were found all sorts of half-rotten rags and rubbish, and an appreciable dampness was discovered on the wall itself. Probably this irreparable injury to what is certainly the finest monument of the Napoleonic epoch in Europe is sufficiently accounted for by the dampness behind the painted surface combined with the heat to which the frescoes are subjected from the lighting of the innumerable tapers burned in the cathedral on all festivals.

The Capitol at Washington. The "Scientific American" asserts without reservation that the Capitol at Washington is soon to be extended, on the east side, by the addition of a mass of building connecting the present wings and entirely covering the old sandstone front between the wings, which will be visible only in the courtyards. It seems that the late Dr. Walter, the architect of the dome and of the wings, left plans for such an extension as is now contemplated, which are to be carried out substantially as he left them, some changes only being made in the arrangement of the rooms. Dr. Walter's design for the new middle portion suits admirably the noble, almost romantic dignity of the wings, besides adding much to the effect of the dome.

GHYLL COTTAGE, GOUDHURST, KENT.
ARTHUR T. BOLTON, ARCHITECT.

York Minster. Practically the whole work of restoring the north-west tower at York Minster has now been completed, and the scaffolding is being removed. This third stage of the work, now completed, has been the most expensive owing to a series of elaborate buttress gablets, niche heads and pinnacles. Up to August the carver had carved 2,058 crockets, 118 birds, 62 grotesques. 61 finials, 87 gargoyles and a number of bosses. No less than 6,608 cub. ft. of stone have been used. The condition of the stained glass in the chapter-house now demands speedy attention. Mr. Grylls, of Burlison & Grylls, Newman Street, Oxford Street, London, the expert called in to advise as to the chapter-house windows, states in a communication to the architect (Mr. Bodley, R.A.) that the stained glass is in a most deplorable condition. He says:—"The glass is corroded to an extent that in forty years' experience he has never seen before. The whole of the glass is crumbling into dust, daylight is showing through in many places, and quite a large quantity of the glass is as thin as tissue paper, and breaks at the slightest touch. In the first place minute holes are formed, which enlarge until they meet, and the whole surface becomes eaten away. All the 'decorated' glass in the cathedral is corroding in the same manner. The chapter-house windows are a little earlier, and are in the worst condition, but there is no doubt that unless something is done to protect the outside surface from the atmosphere before very long the nave windows will be in the same condition." A commencement has already been made with the staging for the restoration of the south-west tower.

Cecil Rhodes and the Picture-Dealer. A French newspaper, "Le Journal," relates that Cecil Rhodes by his will left a sum of 50,000 francs (£2,000) to an eminent Parisian picture-dealer under the following curious circumstances. Rhodes took a fancy to a small picture by Rembrandt for which the dealer asked £600. This sum Rhodes was not prepared to pay, but proposed an arrangement by which if the dealer died before Rhodes he should leave the picture to Rhodes by will, and if Rhodes died first the dealer should have £2,000. This arrangement, it is said, was actually carried out and Rhodes for once in his life—or shall we say in his death—lost.

A Monument at Boulak, Cairo. M. Denys Puech, the eminent French sculptor, has recently completed the model of the monument to be erected by the Egyptian Government to the memory of Mariette, the distinguished Egyptologist, to whom we owe the discovery of the Serapeum or the temple of the god Apis, the excavation of the Sphinx, the creation of the Egyptian Museum at Boulak, near Cairo, &c. This monument, which will be erected in front of the Boulak Museum, will embrace an extensive basement of grey granite, in the centre of which will be placed the bronze statue of Mariette on a pedestal of black marble. The distinguished man is wrapped in an overcoat, in a meditative attitude, with the right hand resting on a fragment of Egyptian sculpture. In front of the pedestal will be placed the actual tomb of Mariette, which is at present at Memphis and consists of a sarcophagus of pink granite discovered among the ruins of the Serapeum, which, after having enclosed for centuries the bones of the sacred bull Apis, now serves as the last resting-place of the eminent French archæologist. The transfer of the sarcophagus will take place at the close of the year 1903, a short time before the inauguration of the monument, which it is expected will be accomplished in the month of January, 1904. Mr. Maspero, a pupil of Mariette and his successor at the head of the archæological department of the Egyptian Government, will visit Mr. Puech's studio in order to advise him before the finishing touches are given to the model of the monument.

At St. Hildeburgh Church, Hoylake, a stained-glass window is to be erected at the west end. A new carved oak pulpit on a marble base will also be provided for this new church, and the north wall of the chancel is to be panelled in oak, on which will be painted a representation of St. Hildeburgh with angels.

LADDERING TALL CHIMNEYS.

By B. WYAND.

OF recent years several appliances for "laddering" tall chimneys have been put on the market, but amongst the majority of steeplejacks (which term usually includes chimney and spire restorers and lightning-conductor fixers) the older and more practical methods still obtain. It is proposed in this article to give an outline of one of the more common of these ready means of climbing giant chimneys with scaffolding for the purpose of executing repairs or other work.

The outfit consists of ordinary wooden ladders from 15ft. to 20ft. long, sundry 9in. to 12in. iron dogs (see *a a* Fig. 1), rope lashings (*b b*, Figs. 1 and 3) and a block and fall. To the top of each ladder are fixed projecting pieces of wood, known as distance pieces (*c*, Fig. 1), which serve to keep the ladders away from the brickwork when fixed and give the workmen secure foot- and hand-hold.

The fixing of the first ladder (Fig. 1) is an easy matter. It is reared against the shaft, and two dogs are driven into the brickwork, the first about 4ft. above ground-level and the second at about the same distance below the top of the ladder. To these dogs it is then securely lashed.

This length having been fixed, a second ladder is placed against the first and from this a dog is driven into the brickwork (Fig. 2) at about the same distance of 4ft. above the top of the first. To this dog the block is lashed, one end of the fall being made fast to the middle of the second ladder, which is then hauled up by the workmen on the ground until it is in the position shown by dotted lines in Fig. 2. It is then temporarily lashed at its foot, and thus secured in two places it can be mounted and a further dog driven in higher up. The block having been shifted to this dog (Fig. 3), the ladder is again hoisted, such further dogs as may be considered necessary are driven in, and the whole ultimately lashed (*b b*) and rendered rigid. Only two dogs to each ladder are shown in the figures, but it must be understood that these are in pairs.

Many tall chimney shafts have heavy projecting cornices some little distance below their caps, and these must be scaled by means of what a sailor would call "futtock" ladders. The method is simpler than it looks; it is clearly delineated in Fig. 4. The ladder immediately below the cornice is first made extra secure by additional dogs in order to allow for the strain to be placed upon it by the backward throw of the futtock ladder. The latter is then lashed as shown in the figure, and, the top of the cornice reached, the last ladder is fixed. To this further lashings are made, and the job is complete (Fig. 5).

LADDERING TALL CHIMNEYS.

Engineering Notes.

Mr. Charles Gandon, M.I.C.E., late engineer to the Crystal Palace Gas Co., Ltd., died last Wednesday at the age of sixty-five years.

Award to Messrs. Ewart & Son, Ltd.—The committee of the Sanitary Institute at the Health Exhibition recently held in Manchester have awarded to Messrs. Ewart & Son, Ltd., of 346-350, Euston Road, N.W., a medal for the efficiency and safety combined in their well-known "Lightning" geyser.

A new Water Scheme for Margate.—The first sod for Margate's new waterworks was cut on Friday last. Water is to be brought from a place near Wingham, a distance of sixteen miles inland, at a cost of over £70,000. The scheme is being carried out under the direction of Mr. Albert Latham, and by the end of next June the work will be sufficiently advanced for the town to be supplied with 2,000,000 gallons a day from the new source.

The Society of Engineers held a meeting on October 6th (Mr. Percy Griffith, president, in the chair), when a paper was read on "The Hennebique System of Ferro-Concrete Construction" by Mr. Augustus de Rohan Galbraith. The following examples were given of the cost of the Hennebique system as carried out in different structures:—The Chatellerault Bridge, £18 12s. per lineal ft.; a grain warehouse at Plymouth, 4½d. per cub. ft. of space; a flour mill at Swansea, 4¼d. per cub. ft.; grain silos at Swansea, 6¼d. per cub. ft.; and some coal hoppers at Portsmouth, 7¼d. per cub. ft.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Checking Dry Rot.

STOKE-ON-TRENT.—C. G. C. writes: "I notice that a weak solution of vitriolic acid with water is recommended in 'Gwilt' as likely to stop dry rot. Kindly give your experience as to the effectiveness of this remedy and the proportion of acid and water to be used."

Dr. I. Bayley Balfour, Regius Keeper at the Royal Botanic Garden, Edinburgh, has been kind enough to furnish us with the following reply to the above query: "The solution mentioned by 'C. G. C.' would not be of much use in checking the dry rot. A great many different solutions and substances have been tried from time to time, but none of them have proved to be of permanent value. Among the various substances tried creasote has been found to be the best, but even this is not permanently efficacious. A simple disinfectant against the dry-rot fungus has not yet been discovered, and according to the best authorities there never will be such a substance invented. Thorough ventilation and dryness is the best means of preventing the spread of dry rot, because, as is well known, the damage is caused by a fungus growing in the wood, and this saprophyte cannot live in the absence of moisture."

Details of Steel Roof-Truss.

BIRMINGHAM. — ANXIOUS writes: "The accompanying sketch (not reproduced) shows the outline diagram of a roof-truss for a span 59ft. 6in. in the clear, trusses 13ft. apart, to be built up of best English steel. (Two designs of framing omitted, with numerous sizes.) Are both designs constructionally correct? Which would be the better from the point of view of good construction combined with economy? Which method of wind-bracing is preferable?"

It is impossible to say that all parts are correctly proportioned without going through the detailed calculations for both trusses. The principal rafter should be deeper than its width if there is any choice of section. The flats for ties should be wide enough to allow for loss of metal by pin and rivet connections. The smaller members should be made rather heavier than necessary, in order to reduce the number of different sections employed. The wind-bracing is only required on exposed roofs; and when rods are crossed in the bays between main struts for this purpose no horizontal member is required at the bottom. It is a matter of choice whether these ties, or ties on the back of principal rafters, be used. The truss shown is an economical form for spans from 45ft. to 60ft. The purlins must always rest on a principal rafter over a strut.

HENRY ADAMS.

Some New London Buildings.

SUNDERLAND.—R. G. K. writes: "I am going to Durban, but on the day before I sail should like to see one or two good buildings in London—offices, banks, town halls, &c.—inside as regards finishings. Kindly name a few."

Presuming you mean new buildings, we should suggest your visiting the offices at the bottom of Fleet Street (on the right going towards St. Paul's) by Mr. Huntly-Gordon, and another block by the same architect in Cannon Street (on the left going towards the station); they are both of red brick with plain stone dressings. No. 5 Newgate Street (Mr. C. Stanley Peach, architect), might also be

visited. Then there are several new blocks of offices in the neighbourhood of Moorgate Street and Finsbury Pavement. As regards banks, you might inspect that of Messrs. Barclay & Co. at the top of Fleet Street (Mr. Reginald Blomfield, architect) and the British Linen Co.'s bank in Threadneedle Street (Mr. J. Macvicar Anderson, architect); while as an example of a modern town hall there is Mr. Hare's at Shoreditch. The interior of the Hotel Russell, in Russell Square, W.C., might be visited. You do not mention churches, but a visit should certainly be paid to the new Roman Catholic Cathedral off Victoria Street (near the bottom); and Mr. Beresford Pite's new church in Brixton Road is also well worth a visit. It is impossible, however, for you to see very much in a day, and it will perhaps serve your purpose better to go by 'bus from the West End to the East End *via* Fleet Street, and back by Holborn, getting off to inspect any special new buildings which interested you; and in this connection we would specially refer you to our series of illustrated articles on "Recent Street Architecture in London," the last of which appears in our present issue. The first was published in the issue for February 19th last; No. 2, April 16th; No. 3, June 4th; No. 4, July 2nd; No. 5, July 30th; No. 6, August 20th.

Calculating Strength of Concrete and T-Iron Floor.

J. W. B. H. writes: "In a portion of a concrete and **T**-iron floor considered as a beam, what is the method of calculating the M of the **T**-iron in the lower half? The concrete by itself is quite simple to calculate from the formula $\frac{1}{6}$ *ro bd²*, *ro* being taken at 400lbs. per sq. in. in compression and 4lbs. in tension. But when the **T**-iron enters into the question, for tension, to what point are

the centres of gravity taken and what is the length of the arm of the couple? Will the following be correct, for instance, for the flange:—

Effective area of flange, say,	Limiting stress of iron in tension.	Dist. between c. of g. of flange and c. of g. of upper part of concrete.
(2⅞in. × ½in.)	× 11,200lb.	× 4¼in. = M of flange."

Draw to scale a sectional representation of the strength of the concrete and iron beam, *i.e.*, showing the compressional strength above the neutral axis and the tensional strength below it. The drawing may first represent the strength of the concrete alone; then the additional strength due to the iron may be added, as shown by the accompanying illustration. The speckled area above the neutral axis shows the strength of concrete alone to resist compression; and its strength to resist tension is shown by the speckled area below the neutral axis. The light shaded area on the right side of the diagram below the neutral axis shows the strength of iron alone to resist tension. The effective resistance of the beam, resulting from the combined strength of its two materials multiplied by the leverage about the neutral axis, is shown graphically by the darkly-shaded figure on the left side of the diagram. Reference to this left side of the diagram will show that without the iron bar the compressional *resistance* of the concrete beam would largely exceed its tensional resistance, the latter being represented on the diagram by the mere thickening of the vertical line towards its lower end. But by incorporating the iron bar the tensional resistance of the beam largely exceeds its compressional resistance, as the figure shows. The above diagram agrees by scale with the dimensions and strengths stated in the query.

FRANK CAWS.

Graphic Statics: Chimneys.

SOUTHPORT writes: "(1) Kindly name an elementary book on graphic statics. (2) Also one dealing with brick chimneys for factories, &c. (3) Which are the three or four highest chimneys in the world?"

(1) G. S. Clarke's "Principles of Graphic Statics." (2) "Boiler and Factory Chimneys," by R. Wilson (3s.), and "Chimney Design and Theory," by W. W. Christie (12s. 6d. nett). These books can be obtained from Mr. B. T. Batsford, 94, High Holborn, W.C. (3) See reply to an enquiry on p. 459 of our issue for January 16th, 1901.

Books on Stone Carving.

SUNDERLAND.—ENQUIRER writes: "Where can I get a good book on details of stone carving, not stone construction?"

"Details of Gothic Architecture," by J. K. Colling; "Italian Ornament of the XVth Century," by Professor Nicolai; "A Handbook of Ornament," by F. S. Meyer (10s.); "The Historic Styles of Ornament," by H. Dolmetch (25s.). They can be obtained from Mr. B. T. Batsford.

Stone Church, Kent.

SOUTHPORT.—STUDENT writes: "Having drawn the spandrel from Stone Church, Kent (from cast), for a testimony for the intermediate examination R.I.B.A., I should be glad if you could furnish any particulars as to its position in the church, and size, and also a description of church itself."

Particulars and descriptions of Stone Church, Kent, will be found in our issues for September 20th, 1899, and October 4th, 1899; Sir Stephen Glynne's "Churches of Kent"; Murray's "Handbook of Kent"; a guide to the church published by Canon F. W. Murray, The Vicarage, Stone, near Greenhithe; "Illustrations of Stone Church, Kent," by Edward Cresy (published for the Topographical Society by H. Hooper, Pall Mall East, 1840); the "Builder" for February 11th, 1882; and there is a short description with complete measured drawings in Cavelar's "Gothic Architecture," Part IV. (1835). You will probably be able to identify the drawing from these works.

Spink's "House Drainage."

LONDON, N.—E. A. J. writes: "Where could I obtain a copy of Spink's 'House Drainage,' as it is now out of print?"

We do not know where a copy of the book may be obtained. Mr. Batsford cannot supply one, nor hold out any hope of obtaining a copy.

Building a House.

CHORLTON-CUM-HARDY.—W. H. writes: "I propose to build a £50 house in the suburbs of Manchester, and should be glad to know the best way to proceed. I want a small house—say, two entertaining-rooms and about four bedrooms, with modern fittings, &c.—suitable for a bachelor or a man and his wife with one servant. I should like a billiard-room added. I have no experience in erecting houses."

You will need to engage an architect to prepare designs to suit your requirements and to superintend the erection. He will require payment at a per-centage on the cost, usually five per cent. Your best plan is to engage the architect of any house in the locality which you consider nearest suited to your needs. If you are unacquainted with the ability of the architect you think of engaging, or cannot obtain an opinion from someone who has engaged him, you had better fall back on a member of the Royal Institute of British Architects.

Books for Surveyors' Institution Examinations.

CHESTER.—P. L. D. writes: "What books do you recommend for (1) trigonometry, (2) book-keeping, (3) mensuration, (4) fixtures, (5) dilapidations and (6) easements and light and air—for the Professional Associateship Examinations, Surveyors' Institution?"

(1) "Elementary Trigonometry," by J. B. Lock (Macmillan & Co., Ltd., price 4s. 6d.). (2) "Specification No. 5" (published at these offices). (3) "Mensuration and Measuring," by T. Baker (Crosby, Lockwood & Son, price 1s. 6d.). (4) "Fixtures," by Sidney Wright (Batsford, 5s. nett). (5) "Dilapidations" by Prof. Banister Fletcher (Batsford, 5s. 6d.). (6) "Digest of the Law of Easements," by L. C. Innes (Batsford, 6s. 6d.).

Steel Joists in Concrete.

NEWCASTLE-ON-TYNE. — A. R. writes: "Should steel joists embedded in concrete floors be painted, or is the concrete sufficient protection against corrosion?"

Cement is one of the best preventives of corrosion of iron. If the joists are painted, there will not be that required adhesion between the concrete and the iron.

HANDICRAFT.

AN exhibition of work done by the Guild of Handicraft was opened on Monday at the Woodbury Gallery, 37, New Bond Street, W. This Guild seeks to take a middle course between the ultra-individualism of the artist on the one hand and the trade shop on the other. For the last fourteen years the Guild has been working at Essex House, in the east of London, but this year a move has been made to the remote village of Campden, Gloucestershire. The workshops are in one of two gabled "islands" that stand in the High Street, the printing-room being on the ground floor, the metal shops on the middle floor, and the cabinet and carving workshops on the top floor; while in a different part of the grounds is the timber store and the power-house where the rough wood is sawn and the electricity is generated for lighting the shops. This, then, is the place where the work is produced. The work itself can be seen in the exhibition. Mr. C. R. Ashbee, the moving spirit of the Guild, has prepared a great many of the designs—a soup tureen, a writing cabinet, enamels, &c., and, as strictly architectural work, the additions to Womburne Wodehouse, Wolverhampton. Some of the woodwork is beautifully inlaid and finished, and much of the jewellery is pleasing. Mr. Charles Spooner shows a design for a rood screen at St. Anselm's, Pinner; and a large model of a house by the sea, designed by Mr. Ashbee, also attracts attention, with its central courtyard and its terraces. A fine series of Coronation drawings is hung on the walls, among which are depicted the ten imps of progress—criticism (a grey beast with green eyes and antennæ), enterprise, evolution, revolution, radicalism, jingoism, L'Art Nouveau (a commercial-looking creature and of temperament hermaphroditic), neurosis, vandalism (dressed somewhat as a small grocer in holiday attire, but with wings that are not serviceable for flying), and, lastly, self-complacency. The exhibition is well worth a visit.

New Wesleyan Sunday Schools at Douglas, I.M., have been erected at a cost of about £3,000. The principal elevation faces Victoria Street, and the other Wellington Street. The contractor was Mr. Robert F. Douglas, of Brunswick Road, Douglas.

WIRE-GLASS WINDOWS.*

By EDWARD F. CROKER, Chief of Fire Department, New York City.

IT is manifest to all thoughtful minds that the phenomenal development of the real estate values in our cities has made the tall building a necessity, and this necessity has brought with it the need of adopting in building construction barriers to conflagration, and there are to-day buildings capable of enduring without structural injury the action of fierce, long-continued interior and exterior flames and the application of cold water upon their heated surfaces. Structurally a building of this class is admirable—the foundations are secure, the walls and roof fireproof, but openings in walls and roof are necessary to render it habitable. Obviously the vulnerable parts of the building are these openings in walls and roof—its doors, windows and skylights. To these openings the spread of flame is almost wholly attributable. This has been the history of so many destructive conflagrations that experts have long agreed that no structure in a closely-built city can be considered even approximately secure against fire so long as it is provided with only ordinary windows, skylights and doors. My experience and observation have been such as to justify this opinion, and I have most strenuously maintained that the quantity of wood contained in what I have termed "a structurally fireproof building," taking into consideration also the furniture and fittings, would in the event of fire endanger the property and the lives contained within it.

Metal Shutters.

Shutters of iron or of metal-covered wood may protect windows if they are carefully closed, but in practice such shutters fall short of the purpose for which they were intended. When the crisis comes the shutter is frequently found open. Under the most favourable conditions an iron shutter at a fire is not the thing that the firemen want to come in contact with. Its rusty fastenings and blistering sides are objectionable, to say the least, and its reach when it swings open is liable to knock a man off the ladder. This is a risk to which the fire-fighter should not be subjected.

The Best Fire-Stop.

Wire-glass is, in my opinion, the fire-stop for window and skylight openings—wire-glass set in metal frames. It supplies the requisite light and ventilation as well as protection against fire; its installation obviates the necessity of the cumbersome and unsightly hinged shutters and the projecting lugs and adjustors which support and secure them. It affords protection regardless of the janitor's neglect, because the thought of fire is not necessarily present in the mind of the tenant to induce him to close the window-sash, and when closed it prevents the ingress, egress or communication of flame. It enables the fire-chief to grasp the situation and direct his men intelligently. The location and volume of the blaze are immediately disclosed, and if the conditions warrant it the fireman can effect an opening for the stream with his fire-axe.

Succinctly stated, wire-glass has yielded two fixed values as its contribution to fireproof building construction. It retards fire without hiding it—permits the blaze to declare itself. It can be cracked, but it cannot be scattered. If fractured it retains its place.

Quick Fire Location.

Now, we have to remember what we dare not forget, and we are mindful, therefore, of experiences which enable us to fully appreciate the value first stated. Of the many embarrassments to which the fire-fighter is subject, that which prevents fire from disclosing its position in its incipient stage is the most serious . . . . Upon arriving at a fire we are frequently confronted with tin-covered and iron-clad shutrers which obstruct our vision and our efforts to locate and conquer a blaze which becomes a conflagration because of the precious moments lost in concentrating our energies upon the seat of trouble.

This condition has long been a serious menace in all cities, and it is now intolerable, because the installation of wire-glass presents no technical difficulties. It is of acknowledged efficiency and is no less economical than effective. It has withstood the severest tests, and its cost is well within the means of all building owners. The insurance companies give "preferred" rates when it is installed and thus practically invest in it. Their scheme is to reduce hazards, and in the belief that wire-glass effectually accomplishes this they induce its adoption by substantial endorsement. The significance and overwhelming argument in favour of wire-glass as a fire-stop is the fact that when fractured it retains its place and continues to retard draught and its attending flames.

Wire-Glass under the Test of a Fierce Fire.

The fire which destroyed the Armour Lard Refinery, Union Stock Yards, Chicago, threatened for a time the entire district. Chief Musham was present, and he has stated that the wire-glass in the windows of the several walls prevented any communication through them and demonstrated the ability of wire-glass to prevent the spread of flame. The building destroyed was of recent construction, 100ft. by 400ft., five storeys in height, and subdivided into four sections by fire-walls, two of which were completely destroyed. The quantity and nature of the material in combustion—refined lard—resulted in the hottest kind of a fire, and its intensity and duration are hardly comprehensible. The chief tells me that the flames reached to a height of 150ft. above the roof, and the combustion was so perfect that scarcely any sparks were observed.

I am quoting Chief Musham because I think, perhaps, his observation of wire-glass in this instance was under a better condition than can be conceived for an actual service-test of wire-glass. The entire interior of the building was of inflammable construction, made more so by being saturated with lard, and its five great floors were loaded with tons of this highly combustible product. Tanks containing thousands of gallons of rendering were exploded and their contents dashed against the walls and windows, and the intensity of the heat was so great that the walls holding the frames and sashes which accommodated the glass crumbled, but until they fell the wire-glass retained its place.

This fire establishes conclusive proof of the efficiency of wire-glass as a fire-retardant and its staying qualities, and for the purpose of illustrating my subject I have considered it preferable to my own experience.

A Criticism.

"But wire-glass is not subjected to a fire test every day, and except when fire is present it has undesirable, even dangerous, qualities"—thus the editors of the "American Architect" begin a criticism of Chief Croker's remarks. They continue: "When the Engineering Experiment Station has time to study wire-glass, it will find in the many acres of this material at the South Terminal Station in Boston ample food for study and reflection. In the windows that face east, south and west, and in the thousands of feet of pent-roof over the street sidewalks, there is hardly a sheet of the glass that is not cracked and shivered into a dozen or a hundred different pieces of glass, just now held in place by the embedded wire and the unequal planes of fracture of the glass itself. But where cracks are, there moisture and acid-gases can penetrate, and when corrosion has done its work on the wire there is likely to be many a repetition, less innocent, too, of the incident which attended President Roosevelt's reception in this city a few weeks ago, when, as the newspapers reported, a sizable piece of this shattered wire-glass fell on to the platform not far from the President. Meanwhile before the time comes when falls of heavy pieces may be looked for, much of this shattering of the glass is already accompanied by the flying of fine splinters of glass; and as the oculists of Boston are said to have recognised a class of injury that they call "elevated railway eye," it is not impossible that they have been called on to treat for wire-glass eyes travellers who have to use the Boston Terminal Station. As fracture occurs least often on the north side, and most frequently where the windows face the rising sun, it is evident that the manufacturers must give further study to the qualities of radiant heat before wire-glass can be held to be a perfectly safe material to use."

* Extracts from a paper read at the annual convention of the International Association of Fire Engineers held in New York during September last.

Surveying & Sanitation.

Drain-Fakers.—"Grease Trap," writing to "The Times" under this heading, says:—"We are getting to be outrageously over-inspected, and our inspectors are getting to think outrageously overmuch of themselves. The Sanitary Inspectors' Association last Saturday week 'strongly protested against' Dr. Wynter Blyth for his opinion that it is 'unreasonable to expect an old drain to stand the water test,' the result of that opinion having been that a magistrate 'dismissed the case' brought by some local authority against a householder whom some inspector had presumably required to spend a year or two's rent in relaying his drains. The Association further 'urged the Sanitary Institute to dissociate itself from any implied concurrence in this statement,' or, in other words, called on the institute to deny its own chairman. Surely this is a stupendous piece of presumption on the part of persons paid to go about like African witch doctors, smelling out drains, but neither paid nor competent to question, much less to rebuke, a learned doctor for his opinions. The 'water-test' is, I understand, a test which requires all the drain pipes of a house to hold themselves full of water without leaking—a purpose for which they were never conceived, constructed or intended. Wherefore it seems to me that Dr. Blyth was quite right in his opinion thereof. The truth is that, under the action of certain local authorities, a new and intolerable tyranny has been established of sanitary inspectors who go about imposing on householders burdens most grevious to be borne—not because the drains of their houses fail to fulfil their proper purpose, but because they fail to fulfil some other purpose, such as that of holding water like a wine-glass; or because not the drain pipes but the sacred local authority's own sacred sewer itself gives off that sewer gas which has been laid on to every house by Act of Parliament. Reasonable repairs or amelioration of drains no reasonable person would refuse to make. But the most unreasonable tests and requirements of present-day sanitary inspectors must be questioned and resisted. Especially must they be resisted when we find that, after having long terrorized builders and householders, they have now banded themselves together to terrorize and excommunicate even the sanitary doctor himself who seeks to curb their pranks. Unless the drain-fakers are kept in order and brought to their bearings, it will be made impossible to live, much less to carry on business, in any locality cursed with their presence."

WALKER AND KIMBALL ARCHITECTS.

LOUISIANA PURCHASE EXPOSITION, 1904.

THE CHIEF BUILDINGS.

IN our issue for June 25th last we published an article on the great exposition which is to be held at Louis, U.S.A., in 1904 (it was formerly intended to hold it in 1903, but, for various reasons, the opening was postponed a year). In that article a full description was given of the inception of the scheme, of the setting-out of the grounds, and of the methods of construction to be adopted. A large illustration was given of the Building of Varied Industries (Van Brunt & Howe, architects) and the working details —bracing, stresses, &c.—explained in full.

We are able this week to give some illustrations of the other chief buildings of the Exposition, which may now be described in detail.

The Electricity Building (illustrated on this page) will be one of the wonders of the Exposition. The architects are Messrs. Walker & Kimball, of Boston and Omaha; and the contractors Messrs. William Goldie, Sons & Co., their tender for the building being about £80,000. The building is surrounded by water, and has a frontage of 650ft. towards the north and 525ft. towards the east, facing the main lagoon. A column treatment of the Corinthian order is the style selected. To give the feeling of greater height to the building the columns are carried down to the ground. Pediment and towers break the line of the façades. The building has a floor space of 292,000 sq. ft., and on two sides there are cloisters, while a balcony runs round the building, and gives another 100,600 sq. ft. for exhibits. About 185 tons of iron and steel are being used in the construction, whilst in all there are 176 trusses, the largest span being 82ft. The lighting-up of the Palace of Electricity at the Paris Exhibition, 1900, was one of the things that every visitor made a point of seeing. At St. Louis the same idea is brooding: in fact, an attempt is being made to produce a volume of light on a scale that the world has not hitherto seen.

The Manufactures Building (illustrated on the next page) forms the extreme left-hand corner of the main picture looking down the greater boulevard of the Exposition. It faces the Varied Industries Building and is one of the most extensive in the grounds, as it covers an area of 14 acres, and has a frontage to the north of 1,200ft., with a depth of 525ft. (This gives an exhibit space of 400,285 sq. ft.) A tower 400ft. high rises in the centre of the main elevation. Besides the smaller entrances at the corners there are four main doorways; these will be ornamented with groups of statuary allegorical of the great industries. The roof has been designed to give good light and perfect ventilation, while avoiding unduly large skylights. Each façade of the building has an open colonnade: courts fill the interior. A series of mural paintings on the inner walls of the cloister form a pictorial roll of honour of the rise, development and progress of the world's industrial arts. Old gold will be used as the background. The grand manner of Sir Alma-Tadema's work is taken as a type for the style in the designing of the paintings. Messrs. Carrère & Hastings, of New York, are the architects, and, although the building is of a temporary character, it is estimated to cost £50,000.

The architect of the United States Government Building (illustrated on p. 151) is Mr. James Knox Taylor, Supervising Architect of the United States Treasury Department. In style the structure is pseudo-Classic, and in character is more severe than many of the other exhibition palaces. The building is to be let out in separate contracts, the estimated expenditure on it being about £90,000. The site allotted is near the great Art Palaces. Access to the central pavilion is by means of a flight of steps 100ft. wide, adorned with statues severely Classic in design. The building measures 800ft. by 175ft. The main façade is 764ft. long, with centre and mid-pavilions connected by a colonnade of Ionic columns 5ft. in diameter and 45ft. high. The central pavilion with the colonnade on either side forms a portico 15ft. wide and 524ft. long. The building stands on a plateau 50ft. above the level of the general Exposition. An attic 15ft. in height, ornamented with statues, surmounts the Ionic order already noted. The height from the stylobate to the top of the attic is 82ft. The portico leading to the central position is of free-standing Ionic columns, while those of the end portions are in antis. The centre building is surmounted by a dome 93ft. in diameter, after the style of the dome of the Pantheon at Rome. The top of the quadraga that surmounts it is 175ft. above the ground. Spaces have been left in the building for the sculptures, which are now being moulded; they are emblematic of the Republic and the Arts of Peace. The building, like most of the other industrial palaces in the Exposition, is of staff constructed over a frame of timber. In plan it is rectangular. The floor measures 724ft. by 175ft. and is entirely free of columns, the roof being carried with steel trusses of 175ft. span, 70ft. high and 35ft. apart, one end of the trusses being fixed and the other resting on rollers. There are no skylights, as the building is entirely lighted by clearstories. Each of the end façades has a central portico and is 250ft. long. All the great Government Departments will be embraced in the exhibit.

Of the fifteen immense exhibition buildings now growing into form the Palace of the Fine Arts (see p. 151) is the most costly. At the close of the Exposition it will be handed over to the city of St. Louis as a permanent museum building. It is divided into three sections and on plan is like a capital E. The main or central building is of buff brick, whilst the wings, or annexes, are of brick, timber and staff. Collectively the Art Palace covers 450ft. by 830ft., and of this space the main building measures 340ft. by 160ft., separated from its two annexes by open courts 44ft. wide. The cost of construction is set down at about £200,000. By means of the open courts, the architect (Mr. Cass Gilbert, of New York and St. Paul) is

afforded opportunity for dealing with the four façades of the structure. In style the main building is Ionic, accentuated in its chief doorway by a porch and capitol of the Corinthian order, and of majestic proportions. The main façade, with its absence of window openings, is truly Classic. East and west the fronts are treated for about one-half their length in the severe style of the main façade. At the back of this, and including the entire south front, the architect has lightened his wall-surface with window lights. To break the roof line of the chief building a pediment rises to a height of about 40ft. above the general skyline. The Palace has on three sides a large garden which will be beautiful with flowers and foliage. As the building stands on a plateau 60ft. above the other main buildings, this garden is made with terraces and is designed after the fashion of those of the ancient Romans. Replicas of antique sculptures are to be placed at points of vantage, and the walls of the Art Palaces facing the gardens will be inlaid with replicas of tablets and of mural sculptures that have brought down till to-day the art histories of the past. A feature in the garden is a pergola connecting the two ends of the annexe building on the south side. In the centre of the Arts Palace is a hall 157ft. long and 94ft. wide, for statuary. The ceiling is arched and rises 51ft. above the floor. Light is obtained from a high clearstory through large semi-circular windows. On either side of the sculpture-hall picture galleries lighted from skylights fill the entire building. Studios, offices and workrooms are placed in the second storey. In the basement are jury-rooms, packing-rooms and space for heating apparatus.

The Machinery Hall (see p. 151) stands in the grounds next to the Electricity Palace. Messrs. Widmann Walsh & Boisselier are the architects, and the contract has been let to Messrs. Smith & Eastman for £100,000. The building's main dimensions are 525ft. by 1,000ft. The site is a large parallelogram with a huge corner-piece cut out of the south-east angle. The design of the building is symmetrical in treatment. On the south front the main entrance shows a triple arcade with flanking pavilions in the centre. The north front of 1,000ft. has an arcade of seven arches as a centre feature. The two axes of these central features are 60ft. apart and on each there is a cross aisle and a nave 80ft. wide. The two aisles are connected by a lower room, with lantern-light above. The east façade shows a comparatively low building centred by two gables and a smaller entrance. A triumphal-arch form has been used for the entrances and, as a landmark, two large towers (built on massive timber piers) are raised in the centre of the main aisle of the structure. Daylight is admitted through clearstory windows to all the principal aisles. The lower portions of the buildings round the courts are open, but are sheltered from the rain by umbrella galleries. The axial measurement of unit in the building is 20ft. and the widths of the various aisles are multiples of this unit, being 40ft., 60ft. and 80ft. wide respectively. The main aisles are 65ft. in height, and the secondary aisles 30ft. The building, which is constructed of staff, old ivory white in colour, placed over a framework of timber, will house the power plant for the Exposition. The boiler-house is situated a few rods to the west.

The architects of the Liberal Arts Building (illustrated on p. 152) are Messrs. Barnett, Haynes & Barnett, of St. Louis, and the contract has been let to the Conrad Kellerman Construction Co. for about £95,000.

A severe treatment of the French Renaissance is the form used for the exterior façade, and the designers have followed the Classic order closely. The building covers 400,000 sq. ft., the main façade being 750ft. long. Its line is broken by a central pavilion, rising above the roof line, and two end pavilions. The three pavilions form the grand entrances, though, in all, there are ten main entrances. These entrances intersect the exact centres of the exhibit space, the axial lines of the entrances running through the centres of the exhibit spaces from east to west and from north to south. The building is to be constructed without interior columns, the space from wall to wall being spanned by single trusses. Windows, both in the walls and in the clearstory, admit light. One of the features of the building is its interior court. This is being carried out in the old Roman spirit. A cloister runs around it, decorated with vases, sculptures, copies of the old masters and mural frescoes. On the attic storey of the building is installed a hanging garden.

The Exposition, which opens on May 1st, 1904, commemorates the purchase of the Territory of Louisiana from Napoleon I., which took place on April 30th, 1803. Exhibit space is free, and a certain amount of power will be supplied gratuitously for the processes of manufactures.

The offices for the United Kingdom are at Sanctuary House, Tothill Street, London, S.W. Mr. George F. Parker is the resident representative.

LOUISIANA PURCHASE EXPOSITION, 1904.

LOUISIANA PURCHASE EXPOSITION, 1904: LIBERAL ARTS BUILDING. BARNETT, HAYNES AND BARNETT, ARCHITECTS.

New Patents.

These patents are open to opposition until November 17th.

1901.—Door Latches.—22,561. W. C. HOWELL, 48, Grierson Street, Liverpool, and MILNER'S SAFE CO., LTD., 28, Finsbury Pavement, London, E.C. The latch consists of a rim carrying a spring-pressed bolt, and a block having tumbler levers, &c. This block is reversible, so that a right-handed latch can be easily converted into a left-handed one to suit doors which are hinged in either manner.

1902. — Drawing Boards. — 7,779. S. STANNARD, Flitwick, Bedfordshire. The board is grooved at each side to receive rods which hold the paper stretched. If needed the rods may be retained by clips.

Rolls for Beams, Girders, &c.—12,058. R. D. YORK, Jackson Street, Portsmouth, Ohio, U.S.A. The mill consists of rolls having two passes, one for producing a blank for an I-beam or girder of less than its intended width and having a thickened portion lengthwise for the web, and the other pass for rolling down the thickened portion so as to widen out the web to produce a completed blank.

The following specifications were published on Thursday last, and are open to opposition until November 24th. A summary of the more important of them will be given next week. The name in italics is that of the communicators of the invention.

1901.—18,276, POWELL & DAVEY, machine for excavating. 18,577, BUSH & MEDWAY, push-button controlled electric lift. 18,630, WORMALD PATENT LOCKS CO., LTD., & WORMALD, locks and keys. 18,756, JOHN, locks and latches for doors. 18,930, ROW & ROYLES, LTD., hot-water heating apparatus. 19,045, DE LENCHÈRES, compositions for mortar, concrete, &c. 20,449, WEBB & WEBB, hot and cold water systems for domestic use. 20,584, GLAZEBROOK, pug mills. 20,739, GLOVER, placing the cables of suspension bridges in position. 21,020, SKAIFE, sheet-metal cisterns. 21,482, THOMSON, railway platforms, copings, staircases, &c. 21,616, LAKE (*Portland Cement Fabrik Hemmoor & Valeur*), fireproof lining for kilns. 21,696, ANSCHÜTZ, making holes for blasting operations. 22,754, GNEZDA & HÄCKER, supports for casement windows. 23,469, HALLER & MACHELL, treatment of sewage.

1902.—703, NICOLL, SWINBURNE & CARTE, drainage blocks for pavements, &c. 7,984, WILLIAMS, piles. 9,828, TROTTER, coupling for lead and other pipes. 9,839, BENDER, file-handles. 10,423, HERMES, artificial asphalt. 14,588, LUND & LYCHE, water-heating apparatus. 16,190, JACOBSON, ventilators. 16,396, WILLIAMS, piles.

Law Cases.

The Employment of Young Girls in Brick-works.—At Wigan recently the Park Lane Brick and Tile Co. was summoned in three cases for contravening the Factories and Workshops Act by employing girls under sixteen years of age. Mr. Tinker, an inspector, stated that one of the girls, who had been working at a brick-making machine since she was fourteen years of age, a short time ago got her fingers crushed in the machinery. Mr. Graham, who represented the company, stated that the manager was not aware that he could not employ girls under sixteen. A fine of 10s. and costs was imposed in each case. The company was also summoned for failing to fence machinery, and fined £2 and costs. In all the fines amounted to £5 19s.

Building Lines: A Question of Consent.—At Cheltenham Police Court last week Mr. W. J. Merrett was summoned, at the instance of the Charlton Kings Urban District Council, for bringing forward houses which he is erecting in Coptelm Road beyond the frontage line of the adjoining house. The proceedings were taken under the Public Health Buildings and Streets Act of 1888. The case turned on the question of consent. It appeared that Mr. Merrett had submitted the plans of the houses to the Urban Council, and these had been returned stamped with the word "approved" and the names of the chairmen of the Roads and Public Health Committees respectively. When, however, some progress had been made with the building operations, it was discovered that the frontage line was exceeded. Notice requiring the setting back of the building was served on Mr. Merrett, but he held to the sanctioned plans and ignored the notice. After hearing arguments by counsel the Bench intimated that a majority of the magistrates were of opinion that the consent given by the Council was not the consent required by the Act for extending beyond the frontage line, and they fined defendant £5 with costs. Stay of execution was granted pending an appeal.

Keystones.

Three Stained-Glass Windows, together with a fine mural tablet of alabaster, have been placed in Cranbrook Church, Kent.

A new Welsh Presbyterian Church at Wigan is being erected in brick with Yorkshire stone dressings. Mr. R. Fleming is the architect and Mr. D. A. Ablett the contractor.

The Parish Church of St. John-at-Hackney has been reopened after thorough renovation and the installation of the electric light. The total cost of the repairs and alterations amounts to £1,823.

Mr. Charles France, F.R.I.B.A., architect, of Bradford, died at Oliver Hill, Horsforth, at the age of sixty-eight years, last Wednesday, and was buried last Saturday. Deceased was elected a Fellow of the Royal Institute of British Architects in 1893.

The Remains of a Roman Villa have been discovered at Penydarren Park, Merthyr. Pottery and coins had frequently been unearthed on the site, and this led to an organised attempt at exploration. The hypocaust of the villa has been laid bare, and what has been found leads to the belief that the discovery will prove to be an important one.

A new Catholic Church at New Ross, Ireland, has been erected. It is Early English in style. Its external length is 183ft.; internal length, 151ft.; width across transepts and across nave and aisle, 86ft. and 60ft. respectively; height of ridge of roof, 60ft.; and the height of tower and spire, 183ft. There are double transepts. The marble used in the building is of great variety and includes Kilkenny, Connemara, Middleton, Moate, &c. The carving of the whole church has been done by an Irishman, Mr. O'Connell, of Cork. The altars were erected by Messrs. Pearce & Son, of Dublin, and the communion rails by Mr. Edward Sharpe. Messrs. Smyth & Son, of Dublin, supplied the brass gates of the sanctuary. The confessionals and the screen in the porch were made by Mr. Andrew Cullen, of New Ross, who was the general contractor. The cost has been about £25,000.

"Modelling in Clay, &c.," is the title of No. 50 of the "Useful Arts and Handicrafts Series" just published by Messrs. Dawbarn & Ward, Ltd., 6, Farringdon Avenue, E.C., price 6d. nett.

The Raven Inn at Hook, near Basingstoke, is advertised for sale. The old hostelry was built in the year 1653, and still retains its quaint old half-timbered work overhanging gables and small windows.

A new Church at Cornholme, Todmorden, has been erected to accommodate about 500 persons. Mr. C. Hodgson Fowler, F.S.A., of Durham, was the architect.

A Marble Statue of Queen Victoria at Leamington was unveiled last Saturday. Mr. Albert Toft was the sculptor. The statue stands on a granite pedestal 12ft. in height, and is placed outside the municipal buildings in the centre of the town. It has cost 1,600 guineas.

The Jacobean Cloth Hall at Newbury, an interesting relic of the days when Newbury was a flourishing centre of the cloth trade, has been purchased and restored at a cost of £2,000, and will be converted into a local museum and art gallery as a memorial of Queen Victoria. The old building, which contains some quaint carvings, has for many years been used as a corn store.

The new Gaiety.—At the ordinary general meeting of the Gaiety Theatre Company the chairman said £75,000 had been received from the London County Council towards the new theatre now being erected at the end of the Strand to Holborn Crescent, but they did not think it would be quite sufficient. The first estimate for the building was £63,000, which with extras he thought would be £66,000.

St. Michael's Church, Bath, an early nineteenth-century edifice, has been entirely reseated with English oak. Each of the standards at the ends of the various seats is carved with conventional designs, whilst the backs and fronts of the benches have "linen-panels" carved upon them, surmounted by embattled moulds. The alterations have been carried out from the designs of Messrs. Gill & Morris, architects, of Fountain Buildings, Bath, by Messrs. Harry Hems & Sons, of Exeter. The cost has been about £1,000.

The old Grammar School at Lichfield was recently sold, after keen competition, for £1,035 to Mr. Baset Lever, of Wychnor Park, and the proceeds are to be devoted to the completion of the first portion of the new commercial and scientific schools which the Governors are now erecting at Borrowcop at an expenditure of between £7,000 and £8,000. The new buildings are being carried out from the design and under the superintendence of Mr. T. Hillier-Pyke, architect, of East Ham, London, E. It is expected that the new buildings will be ready for occupation by the end of the present year.

The Clergy and Artists' Association for the improvement of art in churches, instead of holding its usual exhibition at the time of the Church Congress, will have exhibitions this autumn in New York and the principal cities of the United States and Canada in connection with the Architectural League of New York. Reproductions of work executed in this country for churches and other buildings under its auspices will be shown, including painting, sculpture, glass, architectural work, metalwork, embroidery, &c. It is thought that the exhibition may have importance in influencing the direction of church art in America, where, as in this country, such art is apparently more in the hands of commercial houses than in those of individual artists having a real interest for the work.

A new Sanatorium in Delamere Forest is being erected at a cost of about £70,000. There will be provision for ninety beds for the treatment of consumptives.

The largest Sunday Schools at Walthamstow were opened recently for the trustees of the United Methodist Free Church. Mr. J. Williams Dunford of 100c, Queen Victoria Street, E.C., is the architect.

A Memorial Statue of Mr. Gladstone at Glasgow, in George Square, was unveiled on Saturday by Lord Rosebery. It is in bronze, and represents Mr. Gladstone in his robes as Lord Rector of the University. Mr. W. Hamo Thorneycroft, R.A., was the sculptor.

Liverpool Cathedral.—The executive committee of the Liverpool Cathedral Committee have decided to confine the final competition to the five architects selected by the advisory architects. Each competitor will receive an honorarium of 300 guineas. The conditions of the competition will be issued shortly.

A new Church at West Derby is being erected as a chapel-of-ease to the parish church. The site is situated at the hamlet known as the Dog and Gun. It has been designed by Mr. J. Oldrid Scott, son of the late Sir Gilbert Scott, and will be of stone, in the Early English style, cruciform in shape, with nave, apse, two transepts for the organ and vestries, and surmounted by a small central tower. It will accommodate about 300 persons. The contractors are Messrs. Lowe, of Burton-on-Trent.

Open-Air Sanatoria.—The Secretary to the Hospital for Consumption and Diseases of the Chest calls attention to the fact that the committee are at the present moment building a "country branch" for open-air treatment, with a convalescent home, at Hatherside, near Bagshot, on an admirably adapted site on Chobham Ridges. This new building will have all the latest improvements, and be able to accommodate 100 inmates, and will, it is hoped, be ready next year. The cost will be altogether about £60,000. Mr. E. T. Hall, F.R.I.B.A., is the architect.

The Church of St. Michael, Bristol, is comparatively modern and of the style familiarly termed "debased," but it rejoices in a tower that dates back to the fifteenth century, and is a fine example of the well-known Somersetshire type. When the old church of the same date was destroyed and its successor erected the tower was repaired and patched up in the style of the period, but happily was not demolished. It has now been restored. The modern alterations have been as far as possible effaced, and the greatest care has been taken to preserve the old stonework. The cost has been £1,200.

The Glasgow Technical College Architectural Craftsmen's Society held its opening meeting of the session last Friday evening, when the presidential address was delivered by Mr. C. Ernest Monro. At the outset reference was made to the progress and work of the Society since its institution, and thereafter he proceeded to read a paper entitled "Materials—Some Misuses and Limitations." The "Lamp of Truth" was strongly emphasized, and the importance of practical knowledge of the nature and capabilities of materials with regard to their individual uses and adaptabilities for particular purposes and treatment in construction. A vote of thanks was accorded to the lecturer, and attention was called to the conditions of the prize offered by Mr. P. Macgregor Chalmers, I.A., for the best essay on the subject of "New Buildings in Glasgow and their Methods of Construction."

St. James's Concert Hall, Piccadilly, W., was built by Owen Jones, who introduced the designs and colourings of Moorish architecture, but in the redecoration Mr. Walter Emden, who has been the architect of the building for the past thirty years, has introduced the Byzantine style. The colour scheme is one of considerable boldness; the main walls are an intense red, combined with subdued green and gold, while the ceiling panels are painted with an immense Byzantine design in green, yellow and cream. Modelled plaster has been substituted for the old iron fronts to the balcony and gallery. The new fronts are concave, thus giving additional comfort to the sitter, and a book rest has taken the place of the old rail. The approaches to the concert hall have been completely modernized with oak doors and dado, and the Regent Street entrance has been widened, the vestibule at the top of the first flight of stairs being converted into a crush room. The hall in which the Mohawk Minstrels perform has also been entirely renovated and decorated in Renaissance style, the grand entrance in Piccadilly being at the same time greatly improved, the walls at each side being covered with dove and Sicilian marble and the floor laid with marble tiles.

ULSTER SOCIETY OF ARCHITECTS.

THE annual meeting of the Designing and Sketching Club of this Society was held at 16, High Street, Belfast, on October 6th. Mr. M. J. Gilliland, M.R.I.A.I., presided. The secretary's report on the work of the summer session showed that inspection visits were made to the Belfast Municipal Buildings now in course of erection, by invitation of the architect, Mr. Thomas, who personally conducted members over the works; the Royal Victoria Hospital, Belfast, by invitation of the architect, Mr. Henman; St. Ann's Cathedal, Belfast, in course of erection, by invitation of the architect, Sir Thomas Drew, and under his guidance; and the cathedrals of Christ Church and St. Patrick, Dublin, by invitation of Sir Thomas Drew, honorary architect, and under his guidance. Five sketching visits were also paid to important buildings in and around the city.

Mr. E. R. Kennedy was re-elected joint hon. secretary and treasurer; committee, Messrs. Maxwell, Murphy and Kennedy.

The chairman then proceeded with his opening address to students, in the course of which he pointed out the many advantages to be acquired by taking the qualifying examinations of the R.I.B.A. as a basis. These examinations were the only substitute for registration until the proper legal powers were obtained. He went on to deal with the evidence which he had given before the Royal Commission on University Education in Ireland. He considered an intelligent study of the following subjects, as far as they applied to the architectural profession, of great importance:—Botany, zoology, geology, physics, hygiene and architectural jurisprudence. In conclusion he expressed a hope that the suggested Chair of Architecture in the Queen's College, Belfast, would soon be instituted.

The programme for the coming winter session was briefly reviewed. It includes subjects for design set by the folllowing senior members of the profession:—Sir T. Drew, P.R.H.A., Mr. W. J. Gilliland, M.R.I.A.I. (vice-president of the Society), Mr. V. Craig and Mr. F. H. Tulloch, FF.R.I.B.A., Mr. S. P. Close, A.R.H.A., Mr. J. St. J. Phillips, A.R.I.B.A., Mr. J. J. McDonnell, Mr. A. T. Jackson, Mr. J. C. Lepper, members R.I.A.I.; also lectures by Mr. W. J. Fennell, M.R.I.A., Mr. W. J. W. Roome, M.S.A., and Mr. F. E. Ward. The president closed his address by congratulating the students on the very successful work accomplished since the formation of the club in April last.

Complete List of Contracts Open.

DATE OF DELIVERY.		WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
		BUILDING:		
Oct.	16	Llanfairfechan, Wales—Police Station and Cells		County Surveyor, Carnarvon.
,,	16	Croydon—Cement, Lime, &c.	Town Council	Borough Road Surveyor, Town Hall, Croydon.
,,	16	Armley—Shed		C. S. Nelson, 15 Park Row, Leeds.
,,	16	Longhope, Orkney—Custom House	Commisssioners of H.M. Works	H.M. Office of Works, Edinburgh.
,,	16	London, N.—Builders' Work at Infirmary	Islington Guardians	W. Smith, 65 Chancery Lane, W.C.
,,	16	Lincoln—Reseating, &c., Chapel		W. Mortimer & Son, Architects, Lincoln.
,,	16	Londonderry—Improvements to Houses, &c.	R. Gallagher	J. P. McGrath, 28 Carlisle Road, Londonderry.
,,	17	Cairncross, near Stroud—Isolation Hospital	Joint Hospital Board	Vale & Kingsford, 21 George Street, Gloucester.
,,	17	Great Yarmouth - Two Houses		C. G. Baker, Architect, Town Hall Chambers, Great Yarmouth.
,,	17	Halifax—Bakery, &c.		M. Hall, 29 Northgate, Halifax
,,	18	Bury, Lancs—Walls	Water Board	J. Cunliffe, Farm Bailiff, Windy Bank, Water, Rawtenstall.
,,	18	Cobridge, Staffs—Rooms at School		A. Price, Architect, Sandbach.
,,	18	Coniston—Villa	Mrs. Coward	J. Bell, Architect, Coniston.
,,	18	Five Roads, Llanelly—House		W. Bennett, Ystodwen Farm, Five Roads.
,,	18	Porthcawl, Wales—Alterations, &c., to Police Station	County Council	County Surveyor, Town Hall, Bridgend.
,,	18	Chorley, Lancs—Bricks	Corporation	Borough Surveyor, Chorley.
,,	18	Tunbridge Wells—Flues at Electric Light Station		Borough Surveyor, Town Hall, Tunbridge Wells.
,,	18	Sheffield—Infirmary Block	Ecclesall Bierlow Union Gdns.	W. H. Lancashire & Son, Architects, Hartshead, Sheffield.
,,	18	Cobridge—Additions to School		A. Price, Architect, Sandbach.
,,	19	Ardoyne, Belfast—Fire Brigade Station	Corporation	W. J. Hunter, Quantity Surveyor, Scottish Provident Bldgs., Belfast.
,,	19	Belfast—Fire Brigade Station	Police Committee	S. C. Hunter, Quantity Surveyor, Scottish Provident Bldgs., Belfast.
,,	20	Bridlington—Underground Lavatories	Corporation	Borough Surveyor, Town Hall, Bridlington.
,,	20	Kingston-on-Thames—Ambulance Shed, Additions to Infirmary, &c.	Union Guardians	J. Edgell, Clerk, Union Offices, Coombe Lane, Kingston-on-Thames.
,,	20	London, W.—Bricks, Lime, Cement, Glass, &c.	Great Western Railway Co.	Stores, Superintendent, Swindon.
,,	20	Hemsworth—Ten Houses	R. P. & J. W. Husband	Tennant & Bagley, Architects, Pontefract.
,,	20	Plymouth—Workmen's Dwelling Block	Corporation	J. Paton, Borough Engineer, Municipal Offices, Plymouth.
,,	21	Sheffield—School	School Board	W. J. Hale, 13 St. James's Row, Sheffield.
,,	21	Acton—House, &c.	District Council	D. J. Ebbetts, 242 High Street, Acton.
,,	21	Accrington—Works		H. Ross, 15 Cannon Street, Accrington.
,,	21	Loughor, Wales—Repairs to Bridges	Carmarthenshire County Council	J. W. Nicholas, Clerk, County Offices, Carmarthen.
,,	21	Newbridge—Twenty-eight Houses	Abercarn Urban District Council	G. Stevens, Surveyor, Council Office, Abercarn.
,,	21	Brierley Hill, Staffs—Technical School and Free Library	Urban District Council	J. L. Harper, Town Surveyor, Town Hall, Brierley Hill.
,,	21	Loughborough, Leics—School	School Board	Barrowcliff & Allcock, Architects, Mill Street, Loughborough.
,,	22	Carlton, Notts—Isolation Hospital		F. Hopkinson, 40 Bridge Street, Worksop.
,,	22	Burton-upon-Trent—Car Depot	Corporation	Kincaid, Waller & Manville, 29 Great George Street., London, S.W.
,,	22	Dublin—Eighty-four Labourers' Cottages	South Dublin Rural Dist. Council	T. J. Byrne, 1 James's Street, Dublin.
,,	22	Beverley—House	East Riding Asylum Committee	C. W. Hobson, Clerk, Newbegin, Beverley.
,,	22	Belfast—Shops and Offices		Mr. Hunter, Scottish Provident Buildings, Belfast.
,,	22	Swadlincote, Burton-on-Trent—Chimney Shaft	Urban District Council	G. B. Smedley, Engineer, Gasworks, Swadlincote.
,,	23	Merthyr Tydfil—Additions to Campsie House	Union Guardians	T. Roderick, Architect, Aberdare.
,,	23	Greenwich—Additions to Schools	Union Guardians	T. Dinwiddy & Sons, 12 Crooms Hill, Greenwich, S.E.
,,	23	Carmarthen—Boiler and Engine House		E. W. Reed, Clerk, Asylum, Carmarthen.
,,	24	East Cliff, near Dover—Coastguard Buildings	Admiralty	Director of Works Dept., Admiralty, Northumberland Avenue, W.C.
,,	24	Bradford - School	School Board	T. C. Hope & Son, 23 Bank Street, Bradford.
,,	28	Crewe—Pavilion at Hospital	Town Council	G. E. Bolshaw, 189 Lord Street, Southport.
,,	28	Isleworth—Vagrant Wards at Workhouse	Brentford Union Guardians	W. Stephens, Clerk, Union Offices, Isleworth, W.
,,	29	Londonderry—Additions, &c., to Infirmary	Infirmary Committee	A. E. Murray, 37 Dawson Street, Dublin.
,,	31	Cork—Rebuilding Premises	Young Men's Association	W. H. Hill & Son, Architect, Cork.
Nov.	3	Beaufort, Wales—Classrooms, &c.	Llangattock School Board	H. Waters, Architect, Waengoch, Beaufort.
,,	4	Ystradgynlais, Wales—School		P. Williams, Tyr Gorof, Ystradgynlais.
,,	15	Bromsgrove, Worcs—Lunatic Asylum	County Council	R. J. Oliver, Clerk, Shirehall, Worcester.
		ENGINEERING:		
Oct.	16	Bootle, Cumberland—Waterworks	Rural District Council	R. Pickering, 11 Lowther Street, Whitehaven.
,,	16	Rotherham—Electric Plant	Corporation	H. H. Copnall, Town Clerk, Town Hall, Rotherham.
,,	18	Wakefield—Electric Lighting	Guardians	H. Beaumont, Clerk, Union Offices, Tetley House, Wakefield.
,,	18	East Retford—Steam Road-Roller		J. D. Kennedy, Borough Surveyor, East Retford.
,,	18	Bootle, Lancs—Electric Wiring	Corporation	Anderson & Crawford, 36 Dale Street, Liverpool.
,,	18	Dudley—Arc Lamp Carbons	Corporation	R. P. Wilson, 66 Victoria Street, Westminster.
,,	18	Glasgow—Bucket Elevators, &c.	Corporation	D. H. Morton, 130 Bath Street, Glasgow.
,,	18	Manchester—Boilers, &c.	Tramways Committee	J. M. M'Elroy, 55 Piccadilly, Manchester.
,,	20	Earby, Yorks—Reservoir	Waterworks Company	H. A. Johnson, 15 The Exchange, Bradford.
,,	20	London, S.E.—Heating	Bermondsey Borough Council	R. J. Angel, Borough Surveyor, Town Hall, Spa Road, S.E.
,,	20	Bury, Lancs—Waterworks	Joint Water Board	J. Cartwright, Civil Engineer, Peel Chambers, Bury.
,,	20	Wigan—Electric Equipment of Tramway	Corporation	J. Slevin, Borough Electrical Engineer, Bradford Place, Wigan.
,,	20	Wigan—Cars, &c.	Corporation	J. Slevin & W. Bolton, Borough Engineers, Wigan.
,,	20	Edinburgh—Covering Yard, &c.	Caledonian Railway Co.	Company's Divisional Engineer, Princes St. Station, Edinburgh.
,,	20	Bermondsey—Heating Town Hall	Borough Council	R. J. Angell, Borough Surveyor, Town Hall, Spa Road, S.E.
,,	21	London, S W.—Electric Car Traversers	London County Council	County Hall, Spring Gardens, S.W.
,,	21	London—Reconstruction of Bridge over Canal	London County Council	Engineer's Department, County Hall, Spring Gardens, S.W.
,,	21	Brandon, Suffolk—Well, &c.	Rural District Council	H. Walker & Son, Engineers, Albion Chbrs., King St., Nottingham.
,,	21	Kilkenny—Waterworks	Corporation	P. O'Grady, Executive Sanitary Officer, Tholsel, Kilkenny.
,,	21	Burnley—Bridge, &c.	Lancs & Yorks Rly. Co.	Engineer, Hunt's Bank, Manchester.
,,	22	Ipswich—Switchboard, &c.	Corporation	W. Bantofts, Town Clerk, Town Hall, Ipswich.
,,	22	Ramsgate—Gas Engine, &c.	Isle of Thanet Ice Co., Ltd.	P. S. Emett, Secretary, Pier Yard, Ramsgate.
,,	22	Swinton, Rotherhithe—Borehole Works	Urban District Council	R. Fowler, Engineer, Council Offices, Station Street, Swinton.
,,	27	Victoria, British Columbia—Steel Bridge		Agent-Gen. for British Columbia, 819 Salisbury House, London Wall.
,,	27	Hill End. near St. Albans—Sewage-disposal Works	Asylums Visiting Committee	B. Latham, Parliament Mansions, Victoria Street, Westminster.
,,	27	Johannesburg—Destructor	Municipality	E. W. Carling & Co., St. Dunstan's Bdgs., St. Dunstan's Hills, E.C.
,,	27	Ramsbottom, Lancs—Tanks Reconstruction	Urban District Council	J. Diggle, Hind Hill Street, Heywood.
,,	28	Glasgow—Machinery, &c.	Corporation	Office of Public Works, City Chambers, 64 Cochrane St., Glasgow.
,,	28	Vielsalm to Lierneux, Belgium—Railway	National Co. of Local Railways	Company's Offices, 14 Rue de la Science, Brussels.
,,	30	Shanghai—Electrical Plant	Municipal Commissioners	Preece & Cardew, 8 Queen Anne's Gate, Westminster.
Nov.	4	Coalville, Leics—Valves, &c.	Urban District Council	J. B. Everard, 6 Millstone Lane, Leicester.
,,	4	Coalville, Leics—Reservoir	Urban District Council	J. B. Everard, 6 Millstone Lane, Leicester.
,,	4	Coalville, Leics—Engines and Boilers	Urban District Council	J. B. Everard, 6 Millstone Lane, Leicester.
,,	14	St. Petersburg—Electric Traction on Tram Lines	Stadt Amt (Town Council)	Stadt Amt, St. Petersburg, Russia.
,,	14	Leeds—Aqueduct Tunnel	Corporation	City Engineer, Leeds.
,,	28	Burton-on-Trent—Inclined Retort Plant	Corporation	F. L. Ramsden, Manager, Gas & Elec. Light Wks., Burton-on-Trent.
,,	29	Manchester—Reconstruction of Bridge		City Surveyor, Town Hall, Manchester.
,,	30	Shanghai—Electric Lighting	British Municipal Councils	Office of the Board of Trade, 50 Parliament Street, S.W.
Dec.	13	Madrid—Canal Reservoir		Office of the Ministry of Agriculture, Commerce and Public Works, Madrid.
		IRON AND STEEL:		
Oct.	16	Croydon—Stores	Town Council	Borough Road Surveyor, Town Hall, Croydon
,,	16	Manchester—Steelwork	Electricity Committee	City Surveyor, Town Hall, Manchester.
,,	17	London, E.C.—Wheels and Axles	Assam-Bengal Rly. Co., Ltd.	O. I. Milne, 56 Bishopsgate Street Within, E.C.
,,	18	Manchester—Cast-iron Pipes, &c.	Tramways Committee	J. M. M'Elroy, 55 Piccadilly, Manchester.
,,	20	London, W.—Stores, &c.	Great Western Railway Co.	Stores Superintendent, Swindon.
,,	23	Manchester—Iron and Steelwork	Gas Committee	C. Nickson, Superintendent, Gas Dept., Town Hall, Manchester.
,,	27	Ashton-under-Lyne—Railing		J. T. Earnshaw, Borough Surveyor, Town Hall, Ashton-under-Lyne.
,,	29	Callao, Peru—Cast-iron Pipes	Corporation	Graham, Row & Co., Liverpool.
Nov.	4	Coalville, Leics—Pipes	Urban District Council	J. B. Everard, 6 Millstone Lane, Leicester.
		PAINTING AND PLUMBING:		
Oct.	16	London, S.E.—Painting, &c., Baths	Lambeth Borough Council	H. Edwards, Borough Engineer, Lambeth Town Hall, Kennington Green, S.E.
,,	20	London, W.—Paints, White and Red Lead, Varnishes, &c.	Great Western Railway Co.	Stores Superintendent, Swindon.

COMPLETE LIST OF CONTRACTS OPEN—*continued.*

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
	ROADS AND CARTAGE:		
Oct. 16	Croydon—Materials and Stores	Town Council	Borough Road Surveyor, Town Hall, Croydon.
,, 17	Preston—Levelling, Paving, &c.	Corporation	Borough Surveyor, Town Hall, Preston.

Builders' Notes.

Mr. R. Hillier has been appointed the clerk f the works at the General Post Office ast, in succession to Mr. E. Carpenter.

The British Fire Prevention Committee has ommenced its winter sessions. Reports are eing issued during this month and the next n tests with armoured doors, and oak and eal doors compared, as well as on uralite oors, and the Pearson's fire alarm. Testing perations will recommence at the testing ation at Porchester Road on October 22nd ith a partition by the British Uralite Co. nd a heavy oak floor for warehouse purposes. he executive are occupied at their weekly ieetings with the question of standardizing ie tests of the Committee, and particulars of ie results arrived at will shortly be published ith the object of facilitating comparisons.

Chrome is found both in European and siatic Turkey in considerable quantities, ut only districts within easy reach of the ea have been worked. The principal work-ngs are in the neighbourhood of Salonica, roussa and Macri. The largest deposits are aid to be in the district of Denislie, but the overnment have granted no permits to ork this region. The Denislie ore has ielded in tests as high as 56 per cent. of xide of chrome, and is a surface deposit. he cost of transport is high. The Broussa ines are comparatively new, and most of is output has gone to the United States. heir proprietor is Ragoub Bey, who, being the Sultan's palace, pays no royalty. The overnment collects a mining royalty of per cent. on chrome and a customs duty f 1 per cent. The ore is frequently mixed ith gang rock (serpentine), and only of late ears have any experiments been made ooking to the separation of the chrome om the refuse.

Fire Insurance and Architect's Fees.—Mr. . Middleton Shallcross, architect, of Liver-ool, writes to the "Times" as follows:—"Some of the fire insurance companies refuse to pay architect's fees incurred in the reinstatement of fire damage, nothwithstanding that premium has been paid upon architect's fees, originally incurred, as part of the cost of the building insured; other fire insurance companies only pay such fees in cases where they have been separately mentioned and described in the policy; and, again, other fire insurance companies always pay such fees whether or not they are separately described in the policy. Those who think they are insured against fire would do well, therefore, to enquire from their assurers how the matter stands in their own particular cases, as otherwise, should a fire occur, they may find themselves uncovered to the amount of several hundreds of pounds in respect of their premises. This information is the result of enquiries made amongst some eighteen or twenty of the principal fire insurance companies of the United Kingdom."

New Companies.

3 BEAUTIFUL FRIEZES.

"THE CORNFIELD FRIEZE."

(1) PLOUGHING; (2) HARROWING; (3) MOWING; (4) CARTING; (5) THE PRODUCTS OF THE CORN FIELD. In Five Separate Plates. Total Length, Fourteen Feet Seven Inches by Fifteen Inches deep. A splendid example of Colour Work in Permanent Ink Photo. By M. PAUL ALBERT BAUDOIN. This magnificent Illustration was presented to the Subscribers to "THE ARCHITECT" in 1886. A few proofs were taken, which immediately became out of print.

In consequence of the almost daily demand for these plates, they have been reproduced by Subscription at **Half-a-Guinea the set,** and are now ready for issuing. Subscribers are requested to make immediate application.

"THE HAMILTON FRIEZE."

(1) AN OFFERING TO CERES; (2) THE EDUCATION OF BACCHUS; (3) MINERVA VISITING THE MUSES; (4) JUDGMENT OF MIDAS. By W. HAMILTON, R.A. Size of each plate, Forty Inches by Fifteen Inches. The whole forming a very beautiful Frieze in Bartolozzi Mezzotint. Price per Set, Ten Shillings and Sixpence on Proof Plate. Free by post, carefully packed inside patent roller, Eleven Shillings.

"THE GALLAND FRIEZE."

From the Wall Paintings in the Hôtel de Ville, Paris, by P. V. GALLAND. Eighteen pieces printed in Terra Cotta, with Gold background.

No. I.	ARCHITECTURE.	No. X.	ENGRAVING.
No. II.	BRICKLAYING.	No. XI.	METAL WORKING.
No. III.	STONE CUTTING.	No. XII.	FOUNDING.
No. IV.	CARPENTRY.	No. XIII.	TURNING.
No. V.	JOINERY.	No. XIV.	SMITHS' WORK.

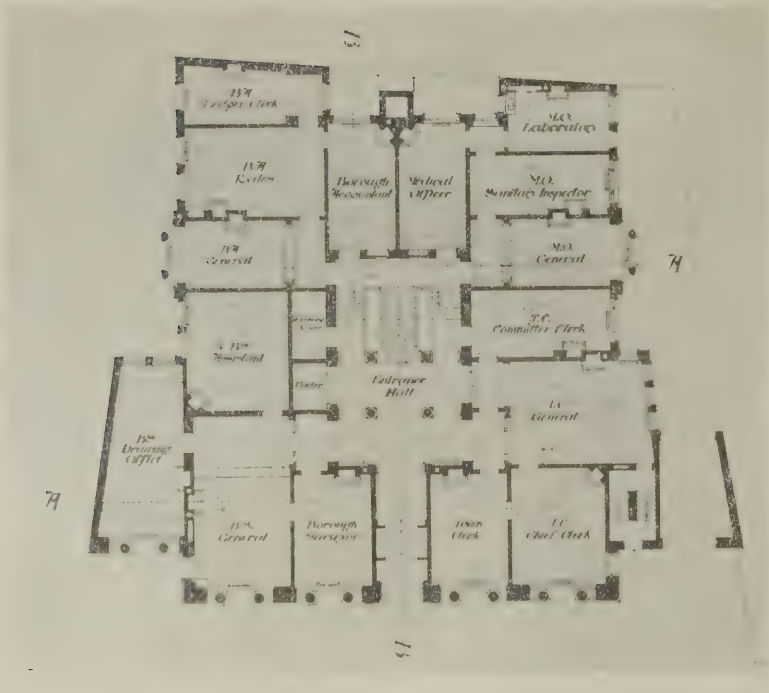
An Architectural Causerie.

A Town Hall Competition.



It seems rather absurd to have to emphasize that the main feature in a block of municipal buildings should be the council chamber; and recalling the notable old examples throughout the country, and the very proper and excellent creed of designing buildings so that they express, or at least indicate, their purpose on the front, one is greatly surprised at the majority of the designs sent in for new municipal buildings at Deptford. Forty-five sets were received, mostly from London architects, yet those which have the council chamber at the front can be counted on the fingers of one hand; for in the majority of cases this room, which is essentially *the* room in the whole building, is relegated to the back, though one competitor has the ingenuity to place it on one side. As a whole the designs do not impress with their brilliancy of planning or beauty of elevation. The site itself, facing New Cross Road, is an awkward one, being somewhat of a trapezoid in shape, which, with the other difficulties of accommodation, light and air, has made the problem a difficult one to solve satisfactorily. The first-premiated design (by Messrs. Lanchester, Stewart & Rickards) has, in our opinion, far and away the best plan of the whole collection. It is straightforward, and makes good use of the available space, the arrangement of the council chamber on the front with the mayor's parlour on one side and the kitchen and service on the other, in conjunction with retiring and committee rooms, being excellent. We are able to give the ground, first-floor and mezzanine plans on the next page, while the front is illustrated on this. This front is pleasing in its general effect, and the suggestion of Deptford's sea glories is interesting; but the clock tower is not altogether happy, and, with so low a building, it is perhaps a question whether a little more emphasis of the vertical would not have been an improvement. Of the second-premiated design (by Messrs. S. B. Russell and C. E. Mallows) there is not much to say. Here again the council chamber is put out of sight and the whole treatment is rather poor; the drawing itself, like that of a second design sent in by the same architects, though very admirably done, is somewhat amusing in its exaggeration of the majesty of the building. The third-premiated design (by Mr. Arthur J. Gale) needs no special comment. Of the rest of the designs we may mention a few. Mr. T. Frederick Pennington's stands up well, though the porch is rather weak in comparison with the massiveness of the other parts; but it is a bold conception. No. 17, by Messrs. Butler Wilson & Oglesby, is fresh in treatment and rather fine in effect. No. 40, Messrs. Banister F. Fletcher and H. Phillips Fletcher, is also deserving of attention; and note should be made of the conical ventilating shaft over the council chamber. No. 13 (Messrs. Crouch & Butler) and No. 15 (Messrs. Wills & Anderson) have good features; No. 35 is represented by a brilliant wash drawing; No. 41 spends a good deal of his money on a huge tower which is not wanted; No. 29 looks like half-a-dozen houses adapted for the purpose in view; No. 18 is extremely ingenious in leaving mysterious spaces between his walls when they are inconvenient to the squareness of his rooms; and Nos. 20 and 21 are more than dimly reminiscent of Colchester Town Hall, a characteristic, however, which they do not share alone. The exhibition of the designs at Sayes Court Hall, Evelyn Street, Deptford, S.E., closes to-day. Mr. John Belcher, A.R.A., was the assessor in the competition, and the cost of the building was limited to £30,000.

DEPTFORD MUNICIPAL BUILDINGS COMPETITION: FIRST PREMIATED DESIGN.
LANCHESTER, STEWART AND RICKARDS, ARCHITECTS.

A Code of Etiquette for Engineers.

Readers may perhaps remember that some time ago we published an American code of ethics for architects. We now have an English one for engineers. The Council of the Institution of Electrical Engineers have addressed a circular letter to the clerks of some of the larger counties and boroughs calling their attention to the code of etiquette which, in the opinion of the Council, ought to govern all those belonging to the Institution. They at the same time point out that by advertising or by employing those who solicit employment, either directly or by agents, local authorities may deprive themselves of the services of electrical engineers of high standing and great experience. The "Code of Etiquette" is as follows:—(1) No consulting engineer should solicit employment as consulting engineer verbally, by letter, by agent paid by commission or otherwise, or by any other means. (2) No consulting engineer should answer advertisements for consulting engineers. (3) No consulting engineer should advertise for employment. (4) No consulting engineer should pay by commission or otherwise anyone who introduces clients. (5) No consulting engineer should receive trade or other discount, or surreptitious commissions or allowances in connection with any works

DEPTFORD MUNICIPAL BUILDINGS: GROUND-FLOOR PLAN.

which he superintends. (6) A consulting engineer who is also directly or indirectly interested in any contracting or manufacturing business should inform his client in writing what his connection is with such contractor. Architects will doubtless read this with interest.

LIGHT, HEAT AND SMOKE.

Forthcoming Exhibition at the Crystal Palace.

A LIGHTING, heating and smoke abatement exhibition is to be opened at the Crystal Palace on Saturday, December 13th, and will remain open for five weeks. Preparations for a really representative display were commenced many months ago, and from the progress already made there is no doubt that the forthcoming exhibition will cover a much wider sphere than that held last year, and, in addition, all the latest and most recent improvements in gas lighting and heating will be included.

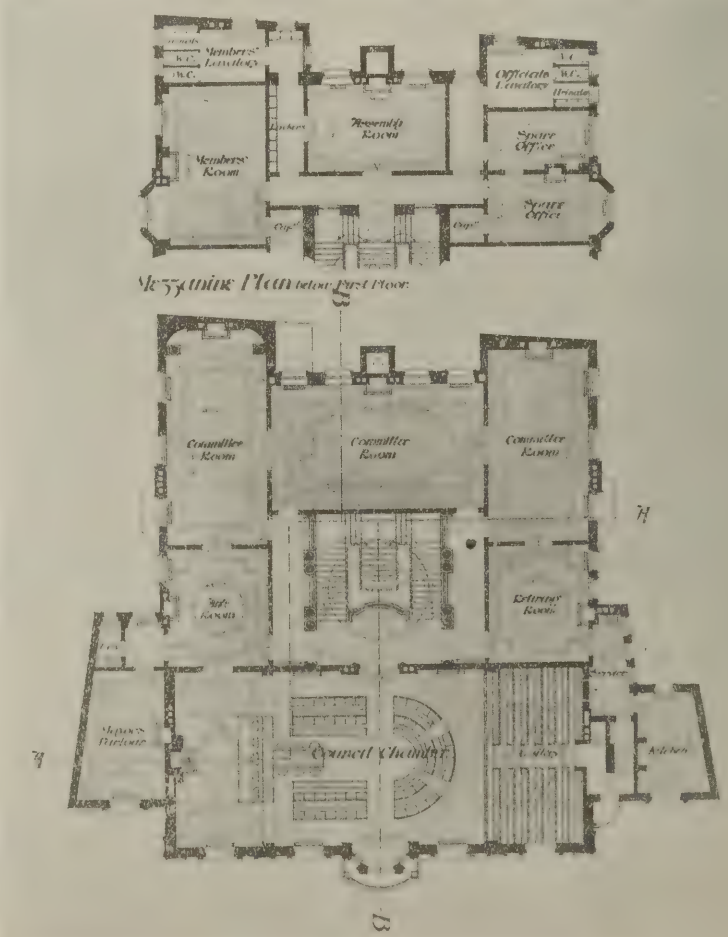
The most important new feature of the exhibition will be the Coal Smoke Abatement Section, which is being organised under the patronage of the Coal Smoke Abatement Society. No branch of modern hygiene deserves greater consideration than that dealing with the question of getting rid of the obnoxious products of combustion of coal, and it is with the object of drawing increased attention to this very urgent subject, and interesting those more directly concerned, that the Society are offering a prize of £50 for the best domestic open gate which in the opinion of a jury (to be appointed by Sir William B. Richmond, president of the Society) is best capable of consuming its own smoke. The section will be situated in the centre transept, while a further space in the building will be set aside where exhibitors can show their various appliances in operation.

The Gas Engineering Section, in which all the most up-to-date contrivances for the more efficient and economic uses of gas will be incorporated, will possess many unique inventions of interest. The latest advances in gas cooking and warming apparatus will be exhibited, and meters of all kinds will be on view. Every description of gas plant and labour-saving appliance for the manufacture of gas will also be able to be inspected. A further section will, of course, be devoted to gas-engines, and also another for colliery exhibits of various coals. The Electrical Section will be fully representative of the industry. The promoters of the exhibition have secured the support of the Acetylene Association, which should ensure this branch being particularly attractive. Next year at about the same time an international exhibition of a similar character is to be held at the Crystal Palace.

OUR NEW COMPETITION.

PRIZES: £5 5s.; £3 3s.; £2 2s.

WE publish this week full particulars of the competition which was briefly announced in our last issue.



The problem set is to re-design *the front* of No. 182, Fleet Street, occupied for the most part by Messrs. Carl Hentschel, Ltd., the well-known firm of photo-engravers. We should like it to be clearly understood, however, that there is no intention of having this remodelled front actually carried out, the premises having been chosen simply on account of their suitability for the purpose of our competition; which purpose is primarily to get students to think out a problem which will doubtless recur in their subsequent career as practising architects.

To re-design such a front so that it complies with all requirements and produces a masterly refined effect is task enough for anyone; and it is with that aim before them we wish all competitors to work. We want no mere stock pattern, no insipid copy of another man's conception, no rubbishy hotch-potch; and while we desire the treatment to be essentially modern—of our own time and carried out under our own conditions—we want none of that rampant uselessness and affected eccentricity which passes current under the name of "Art Nouveau."

The front must be a logical outcome of the conditions, accepted frankly, and expressive of the functions of the building: and the ornamentation should be suggestive of the uses to which the building is put. Provision should be made for a sun blind over the shop.

The following are the conditions of the competition:—

(1) Materials—bricks; with stone dressings optional. Terra-cotta and glazed faïence not admissible. Material for roof optional, but risks of fire to be strictly considered. Exposed ironwork permissible.

DEPTFORD MUNICIPAL BUILDINGS COMPETITION: FIRST-FLOOR PLAN OF FIRST PREMIATED DESIGN. LANCHESTER, STEWART AND RICKARDS, ARCHITECTS.

(2) The general dimensions of the existing building, illustrated on this page, are to be adhered to, but variations may be made where utility suggests.

(3) Regulations of the London Building Acts to be observed.

(4) Cost—no fixed sum is stipulated, but the cost must be reasonable.

(5) Proper provision to be made for lighting and ventilation.

(6) Provision to be made for displaying the names of the users of the building, namely, Carl Hentschel & Co., Ltd., and The British Tea-Table Co., 1897, Ltd.

(7) Drawings required—front elevation; section of front showing ends of floors; plans at ground and first-floor levels, and others (to show projections) if thought desirable; one sheet of details.

(8) All drawings, except details, to be drawn to ¼in. scale; details, ½in. scale.

(9) All drawings to be on white paper of Imperial size (30in. by 22in.) and to be arranged in the following manner—on the one sheet, the elevation, the section at the right-hand side of it, and the plans arranged underneath; a scale to be drawn below the plans. On the second sheet the details, also with scale. Drawings to be unmounted and to have the name and address of the author written in ink on the back

(10) All drawings to be in black and white—clean line work *without wash or colour, pencil or crayon, of any sort;* sections and plans to have walls blacked in solid wherever possible. Neat and accurate draughtmanship will be taken account of in the judging.

(11) A short description to accompany each design, giving particulars of materials employed, &c.

(12) Premiums—first, £5 5s.; second, £3 3s.; third, £2 2s.: all or any of which the assessors reserve the right to withhold if, in their judgment, the designs are not of sufficient merit.

(13) The assessors will be the editors of The Builders' Journal, whose decision will be final.

(14) The drawings will remain the property of their authors, but we reserve the right to reproduce any we think fit. Endeavour will be made to return the drawings to the competitors in good condition, but we do not hold ourselves responsible for any damage or loss.

(15) All drawings to be sent in addressed to the Editor of The Builders' Journal, Effingham House, Arundel Street, Strand, London, W.C., so as to reach him not before November 25th next and not after December 1st next.

(16) Any design will be excluded from the competition which violates any of the instructions here given, or which is received after December 1st next (accidents in transit excepted).

Dimensions.

The following are the dimensions of the existing building:—

Ground Floor:
- Width of pilaster (A)—see illustration on this page—1ft. 2in.
- Width from outside of pilaster (A) to centre of left-hand window bead—6ft. 4in.
- Width of shop window—9ft. 11in.
- Width of pilasters (B, B)—1ft. each.
- Width of door opening in the recess next to (A)—3ft. 11in.
- Width of door opening between (B) and (B)—3ft. 6in.
- Entire width across front, between outside edges of (A) and (B)—21ft. 9in.
- Height from top of glazed sill-board below shop window to pavement—2ft. 3in.
- Depth of shop entrance (next to A)—3ft. 4½in.
- Height from pavement to lead flat over fascia-board above shop—12ft. 6in.
- Height of fascia—1ft. 6in.

First Floor:
- Windows—8ft. by 3ft. 2in.
- Width between window openings—3ft. 5in.
- Height of room inside—10ft. 8in.
- Height from sill level to floor inside—1ft. 10½in.

Second Floor:
- Windows—6ft by 3ft. 2in.
- Height of room inside—8ft. 7in.
- Height from sill level to floor inside—2ft. 3in.
- Height from top of sill on second floor to top of drip moulding over first-floor windows—2ft. 3in.
- Height from top of sill on second floor to top of lead flat above fascia—12ft. 2in.

Third Floor:
- Windows—4ft. 10in. by 3ft. 2in.
- Height of room inside—7ft. 1in.
- Height from top of sill on third floor to top of sill on second floor—9ft. 5in.

Fourth Floor:
- Height of room inside—9ft.
- Height of bench by windows—3ft.
- Height from top of balustrade to top cornice—3ft. 5in.
- Height from top of balustrade to top of sill on third floor—12ft. 2in.

Entire height of building—50ft.

The existing building is fronted with stucco painted ochre colour. The front wall is about 18in. thick.

The ground floor is taken up by the restaurant, and has a counter placed along the right-hand wall. There is a screen directly inside the swing doors to shield diners at the tables from observation and to protect them from draughts.

The first floor is used by Messrs. Carl Hentschel as a general office for the receipt and despatch of drawings and printing blocks. The window on the left-hand side at present lights a telephone office with a desk in the window. This office is formed by a partition which meets the wall between the left window and middle window close to the latter.

On the second floor are a number of proofing machines, and a bench under the window upon which several men are engaged in retouching blocks.

The third floor is occupied with machinery for bevelling, rouletting the blocks, &c., and requires a good light. The window on the left-hand side lights a small square office for the secretary, partitioned off from the rest of the room. This partition cuts the front in the centre of the dividing wall between the left and middle windows.

The fourth floor is used for reproducing drawings by photography, and does not need much light.

It is to be observed that drawings should show only the building in question and not the new building to the right, which is only included in the above illustration to show how the premises are situated. (The street shown on the extreme right of the illustration is Fetter Lane.)

ST. THOMAS À BECKET, WARBLINGTON.

By J. RUSSELL LARKBY.

THE church of St. Thomas à Becket at Warblington, although containing some most interesting features, is one of the least known buildings in the district. It does not, from a point of architectural unity, compare with South Hayling, neither does it rise to the importance of the central tower at East Meon (see THE BUILDERS' JOURNAL for August 13th last); but, embracing work of the Saxon, Early English and Decorated periods, it well represents the gradual development of a very ancient church, when

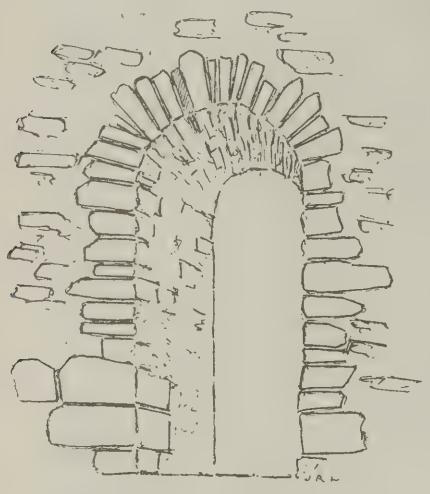


FIG. 1.—SAXON WINDOW IN TOWER.

strength was an absolute necessity, to that time in the thirteenth century when the heavy methods of the Normans gave place to the lightness of the Early English architect.

Owing to its lonely position by the Old Langstone Harbour, the church is now visited by few persons who take even a more than casual interest in ecclesiastical architecture. It is never mentioned in the usual lists of Saxon buildings, yet the remains, if small, are certainly of interest as throwing some light on the architectural development of the structure. The Saxon work referred to is in the tower, and comprises only the lower external stage easily identified by the rude character of the masonry; the walls are pierced by Saxon windows now forming exits to the roof. These arches (Fig. 1) are round-headed, constructed of large blocks of rough-hewn stones with portions of brick at intervals, which seem to be of Roman origin.

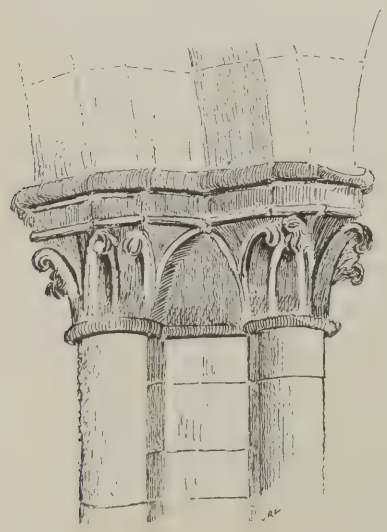

FIG. 2.—CAPITAL IN NAVE.

There are no other portions of the church which can be pronounced as Saxon *in situ*; at the same time, I am not at all prepared to say that some of the masonry, especially that in the fifteenth-century Lady Chapel, did not come from the Saxon building. Some of the masonry in the north wall of this chapel is built up in pilaster-like stripes, but flush with the surface; this may have been an idea derived by the fifteenth-century builders from what they had seen of the old Saxon church. What may be other remains of Saxon work moved from its original position seem to exist in the filling-up of the fifteenth-century door in the south wall of the nave. Some of these stones measured 24in. by 6in., 20in. by 5½in., and others 21in. by 3in. It is quite possible that these came from an earlier building. All other vestiges of the Saxon church have now disappeared, but I think the present Decorated chancel may be looked upon as occupying its site, and that it extended as far west as the tower, which from its early remains evidently marks the western termination of that church. Saxon towers are often of small dimensions, and usually without constructional staircases, for greater safety during the troublous times of the pre-Conquest period. From the scanty remains of the Saxon tower at Warblington it is rather difficult to give a decided opinion, but it certainly well agrees with the tests usually applied to pre-Conquest structures. There is every reason why here the Saxon church should be a tower of strength, exposed as it undoubtedly was to the fierce attacks of hostile people.

FIG 3.—CAPITAL IN NAVE.

The structural alterations followed a somewhat unusual course, but they may be easily read, and to deal with them in chronological sequence a beginning must be made with the nave. This I take to be an entire departure from the original ground plan, and dating from the earlier half of the thirteenth century. This nave was built on to the then existing Saxon church, thus transforming the old western tower into a central tower. Now, the purpose of a central tower is to bind in one the whole fabric of a church, and to be a culminating point on which the eye may rest, as at East Meon or South Hayling. The diminutive character of the Warblington tower is quite unsuited to this purpose, and adds nothing to the external proportion of the building. It seems probable that the thirteenth-century architect foresaw this result, and he therefore carried up the tower to in some measure remedy the defect, which, however, still remains. The whole of the nave work is of the thirteenth century, with the exception of the windows, which are nearly all still later insertions. The piers of the south arcade are peculiarly beautiful examples of Early English carving; the central support is octagonal, and surrounded by four slender circular columns of Purbeck marble. This material is also used in the capitals and bases, which is sufficiently uncommon to be of interest. The effect, perhaps, is not so beautiful as when a whiter material is used, as there is a lack of light and shadow, the peculiar beauty of thirteenth-century foliage; but, on the other hand, a strangely rich appearance is obtained (Figs. 2 and 3). The piers of the north arcade are entirely different in form, and the reader is referred to Fig. 4 in order to see the inferior character of this work when compared to that in the south aisle. It is difficult to account for this curious divergence in two arcades of practically the same date.

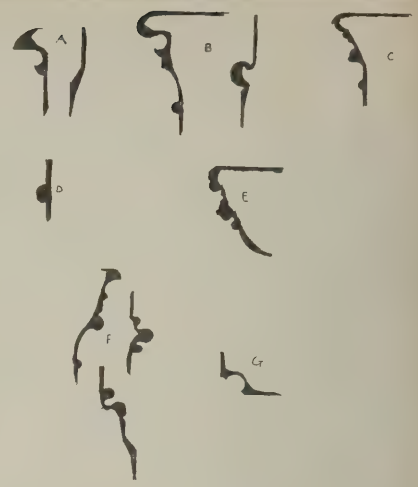

FIG. 4.—MOULDINGS.

A, West respond of north arcade; B, capital and base, north arcade; C, capital, eastern arch under tower; D, Decorated string in chancel; E bowl of piscina in north aisle chapel; F, capital, band and base, east respond of south arcade; G, piscina, south aisle chapel.

At the east end of the north aisle a poor modern screen marks the position of a chapel in which is the good Early English piscina (see Fig. 4, E). The chapel floor has a large thirteenth-century coffin slab of Purbeck marble, probably of the founder of the chantry of which this is the chapel. The south aisle has a corresponding chapel, and a fourteenth-century piscina in its south wall. In the north wall is the recumbent effigy of a young girl in the costume of the latter part of the fourteenth century (Fig. 5). It was originally found under the eastern bay of the south arcade, and then removed and placed under a poor niche of the fifteenth century. The figure is quite uninscribed if we except much modern vandalism. On the floor of the chapel is a coffin slab showing some signs of a floriated cross now too badly mutilated to be of any great interest.

In the north wall of the nave, under a niche never intended for it, is the recumbent effigy of a woman, shown in Fig. 6. There is a tradition in the district that these two ladies desired to build the nave, but could not agree as to the exact design of the new work. As both were equally determined to build according to fancy, each lady followed her own inclinations; hence arose the divergence of style. The story is pretty so far as it goes, but, unfortunately for it, the effigy in the north wall (Fig. 6) antedates everything in the church except the Saxon remains, and the effigy in the south chapel is the latest thing in the church except its canopy, with which it has no relation. I do not for one

FIG. 5.—EFFIGY IN SOUTH AISLE CHAPEL.

moment deny that they may have been benefactresses of the church, but as to their being joint builders of the nave a slight glance at the figures is quite sufficient to serve as an emphatic denial. The effigy in the north wall is of Purbeck marble or some kindred hard material—consequently the drapery is but slightly in relief; the eyes have that peculiar almond-shape and vacant expression so often seen in Norman work.

Leaving the nave, the arch supporting the tower may be brought under notice. Originally, of course, this spot was the western termination of the Saxon nave, but when in the thirteenth century the present nave was added the old wall was destroyed

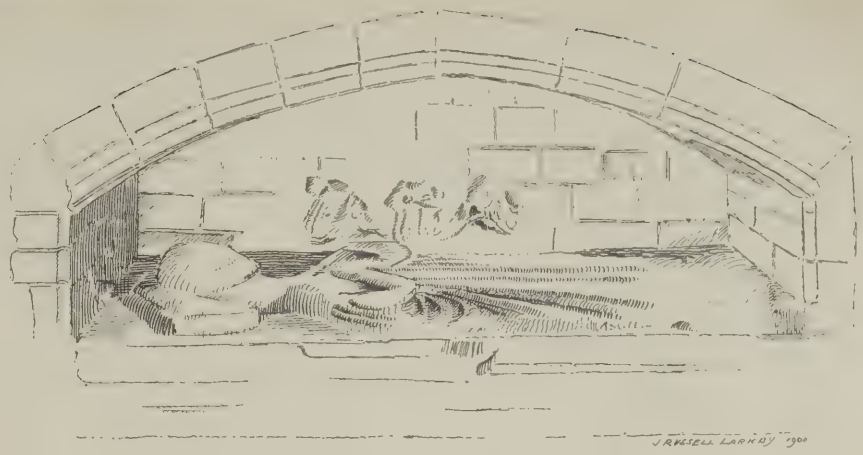

FIG. 6.—EFFIGY IN WALL OF NAVE.

FIG. 8.—EARLY ENGLISH CAPITALS (B, FIG. 7).

and it became necessary to construct arches leading from the Saxon nave (probably still retained as a chancel) to the newly-erected body of the church; from this it will be seen that the Early English architect, with characteristic boldness, cut away a portion of the tower walls and constructed two arches to carry the weight. At this time, too, the tower was carried up two stages above the Saxon work, and with this additional weight it can be well imagined that the slender piers beneath were strained to the uttermost, one eventually collapsing altogether. This is confirmed by a reference to the rough ground plan (Fig. 7). The portion lettered A indicates the fragments of an Early English arch, a companion to that lettered B (the capital of the latter is shown in elevation at Fig. 8). It was seen in the middle of the fourteenth century that these slender columns were no longer capable of bearing the weight of the enlarged tower, and it therefore became necessary to take down the eastern arch and construct in its stead a larger support capable of bearing a great proportion of the strain. This new arch (letter C on plan) is built inside the Early English fragments, and this explains why the Decorated base projects beyond the thirteenth-century columns. A reference to the sketch plan will easily show this curious and interesting method of supporting a tower which had outgrown its inserted supports. The details of the tower arches are shown at Figs. 8, 9 and 10.

Whatever the original chancel may have been, it was entirely renewed during the earlier half of the fourteenth century, as the present long eastern arm dates from that time; it probably includes the site of the Saxon high altar and the whole of the Saxon church — hence its comparatively great length. The architectural details are extremely simple, but it serves as an object-lesson in construction, relying solely on its proportion for effect.

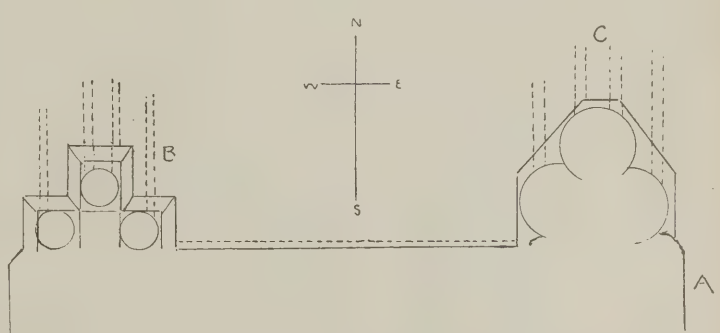

FIG. 7.—SKETCH PLAN OF TOWER SUPPORTS.

The fourteenth-century tiles in the chancel are of great interest as being the only remaining specimens in the district (see Figs. 11 to 14, next page).

Attached to the north wall of the chancel is the Lady Chapel, now used as a priest's vestry; the piscina and canopied credence are both of fifteenth-century work. A rudely-constructed squint pierces the wall of the chapel and bears on the high altar. Beyond this the chapel contains nothing of interest.

The porch in the north wall of the nave is an addition of *circa* 1350; its barge boards are elegantly decorated with pierced cuspings, and the whole of the woodwork has acquired a silver-grey colour by "some six centuries' exposure" to the weather. The door still has its mediæval closing ring.

In passing, some notice should be made of the modern work in the church. Real effect is obtained both in the east window and in the oak roof, but a piece of true restoration—if the expression may be used—would be the removal of the meagre wooden screens of the aisle chapels and some of the glass put in about thirty-five years ago. Nothing so completely spoils the effect of good architecture as bad glass, and here we have a really beautiful interior sadly impaired by much ill-directed energy displayed in some of the nave and chancel windows.

In two of the corners of the churchyard stand small forbidding-looking structures belonging to the truly "Gothic" period of the immediate past. They were erected as watch-houses for the prevention of body-snatching. It is hard not to pity the watcher in this lonely churchyard—a loneliness at times no doubt relieved by a boon companion, animate or inanimate—but still even at that a gruesome loneliness, with the clouds sailing past the moon, the wind and rain beating up with the tide, and—a quick end to the loneliness—over there in the corner a small sudden light, a few swift movements with spades, the professional heaving of a load and a sneaking procession to the water-side completed the science of body-snatching as once practised at Warblington. Now,

thank Heaven, the faithful dead are laid to rest in the hope of a *joyful* resurrection, only the watch-houses remaining as witnesses to an unlovely custom of the "good old times."

THE CATHEDRAL FOR LIVERPOOL.

ONE LAYMAN AND ANOTHER.

ON p. 137 of our last issue we referred to the remarks of "A Layman" in regard to the Liverpool Cathedral Competition, published in the "Times." We were glad, however, to see "Another Layman" take up the cudgels. In his letter to the "Times" he says:—

It cannot be the fact, as suggested by "A Layman," that the assessors have "reported as if no candidate who had not sent in special designs was to be considered a candidate at all," since one at least of the selections for the final competition, and more than one for honourable mention, was based upon drawings of work previously executed. . . . It is quite true that busy men cannot be expected to send in specially-prepared designs But when an architect has already executed work on a considerable scale he can, without difficulty, send in on such an occasion some such record of it in the shape of drawings as will really evidence his fitness or otherwise to design an important building. Instead of this, there were architects who sent in some scrap of drawing or photograph of a kind wholly inadequate to form any basis for a judgment as to his powers. If Hercules presents a foot fragile and insufficient as that of a child, the best judge may be pardoned for not realising how gigantic a body there is concealed.

But it may be said that regard should have been had not alone to the material sent in, but to the knowledge which, from other sources, the assessors might be supposed to have of the powers of the competitors. In that case the sending in of drawings at all would have been a farce—a visiting card would have sufficed. Indeed, some of the drawings amounted to little more, and their submission showed a scant respect to the intelligence of the assessors, of which they might well complain. . . .

The circumstance of youth or inexperience in a competitor does not daunt us in Liverpool, where the genius of a youth of twenty-one has left us our St. George's Hall. It may be (though there is no reason to suppose it) that the assessors are mistaken in their estimate of the capacity of the five selected competitors, and that no truly worthy design will be produced by any of them. But not even then will there be realised the fear which your correspondent expressed that the "Liverpool Cathedral movement may end in a fiasco." For the committee are under no obligation to accept any one of the designs, and if the best of them are not good enough others must be obtained which are.

A Letter from Mr. Bodley and Mr. Shaw.

In last Friday's "Times" was published a letter from Mr. G. F. Bodley, R.A., and Mr. R. Norman Shaw, R.A., the advisory architects in the Liverpool Cathedral competition. Referring to the suggestion of "A Layman," they say:—"We are inclined to believe that we did not misunderstand them (the Committee) at all. We are the more inclined to this belief from the fact of the Committee having accepted our report in its entirety and from having refrained from adding the names of any other architects to our list—a power which they expressly reserved, and which they would have been fully justified in exercising had they desired to do so. 'A Layman' is curiously unfortunate (to say the least of it) in his statement that we directed our attention to those competitors who had prepared a special design, and that we gave little care to those who had taken what we described as 'absolutely no trouble.' He says we judged 'the merits of the architects according to the amount of trouble they had taken in this particular competition.'

"The name that stands first in our list is that of architects who sent only old drawings, and who, therefore, must pass into the category of those who took 'no special trouble.' But the work was well designed, and we accepted these old drawings as strong and decisive evidence of skill. So their authors are to be asked to prepare for the final competition a complete design for the cathedral. We think this fact disposes of the whole of 'A Layman's' letter.

"We wonder if the writer of the letter really saw and studied the drawings (there were about 1,200 of them) as carefully as we did, or if he is writing from mere hearsay.

"If he had seen them we believe he would have been as much surprised at the contents of the portfolios as we were. One competitor sent a single plan rather suggestive of the Albert Hall, the entire area being closely seated. In his report he said he had never built any buildings, and that he had been unable to prepare a design, as he had been ill. Another competitor submitted a large chalk drawing of a figure; a third two photos of a brass lectern, and so on. There were many similar, and many designs equally little to the point. We do not for a moment suggest that a man who can draw the figure could not design a cathedral, but we think the Committee would desire to have stronger 'evidence of skill' in the direction of the work they required done. And when, for example, we placed the two photographs of the brass lectern in juxtaposition with thirteen large and carefully-matured drawings of a cathedral, showing fine architectural skill and great knowledge in every line, we contend that we were right in our view that these threw far more light on the question to be decided than the lectern did!

"When we examined the drawings the names and addresses of the competitors were, at our express desire, carefully concealed, so that we knew the designs by numbers only.

"The numbers in our report in no way indicate any order of merit. They are simply in the rotation marked down as the drawings were hung in the galleries."

The First Section of St. Matthew's Church, Southsea, has been opened. Accommodation is now provided for about 900 persons. The centre aisle will be lofty, with the four massive strong pillars in the centre. The altar, although not yet completely furnished, is richly equipped, and as the chancel is raised somewhat high it is easily seen from all parts of the church. The six standard altar-lights are of massive hammered brass, made from special designs by Mr. J. T. Micklethwaite, F.S.A. The organ-loft is a large one, and will accommodate in a few months a magnificent instrument, costing £2,500, now at Merchistoun Hall, Horndean, which will be reconstructed by Messrs. Norman & Beard of Norwich. The next section to be added is now in course of construction, and will consist of the permanent chancel with all its fittings.

Port Sunlight Church, which, through the courtesy of the "Liverpool Post," we are able to illustrate on the opposite page, is now being erected from the designs of Messrs. William & Segar Owen, of Warrington (the drawing was exhibited in this year's Royal Academy). The church is 104ft. long by 30ft. wide, and will provide accommodation for 800 worshippers. The building will be of Helsby dressed stone, both inside and out, with an open-timbered roof; the pews, doors, and other fittings being of pitch-pine and oak. There are special pews for a choir of forty. The floor is of wood blocks, with marble in the aisles and passages. The work is being carried out by Messrs. Lever Brothers' own staff, under the direction of Mr. J. Barnes, building manager.

ARCHITECTURAL DESIGN.

THE first meeting this session of the Architectural Association School of Design was held at 9, Conduit Street, W., on October 14th, the chair being occupied by Mr. Henry T. Hare, F.R.I.B.A. It had been arranged that Mr. Guy Dawber, Mr. Edward S. Prior and Mr. E. W. Mountford should deliver addresses, but the two latter were unable to attend and their place was taken, at short notice, by Mr. Leonard Stokes.

Mr. Guy Dawber's Views.

Mr. Guy Dawber said:—We are all students together, and any advice which I may give must apply to us both. Broadly speaking, design depends a great deal on its environment and the suitability to its purpose; a town house, for instance, with its more or less decorated front hemmed in by blank walls on either side, would be utterly out of place if transported into the country. You know too well that excess of ornament should be avoided, and that it should only be used to complete your design. It is by going over your designs again and again and rubbing out that you will achieve a successful result. I could give you no better instance of this than Mr. Phil May, whose practice it is to eliminate every line that is not needful for his purpose.

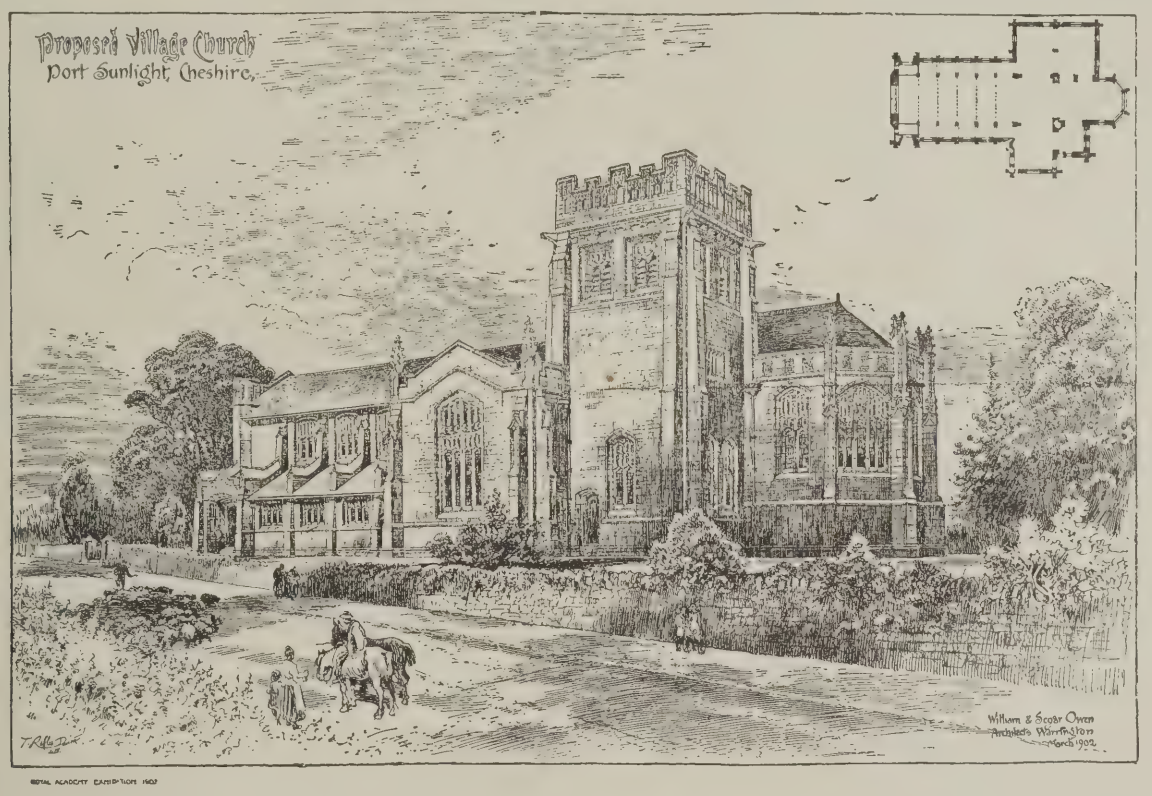
Remember that the object of all decoration is to ornament and to adorn, not merely to show off the skill of the designer and the decorator, and unless placed in the right position it will be worse than useless. It is of course impossible to lay down any hard and fast rules, as in all ages opinion has differed as to what is and what is not beautiful. There is much difference of opinion as to how far the architect's work should be influenced by tradition. Some say, go straight to Nature. This is a fine theory, but in practice it does not seem feasible, as architecture is essentially utilitarian, and neither the ant nor the bee will help us to solve our problems, nor will the contemplation of any number of leafy avenues aid us in designing a church or a cathedral.

Study the best modern work as well as the old: and if you see a building which delights your eye, try to dissect it and discover how its effect is produced. The cultivation of this habit will help you to design far more than studying endless books and illustrations and making scores of pretty sketches.

Beauty in architectural design does not result from richness and profusion, but from elegance of form, proportion, harmony of colour and perfection of execution. All materials have their particular limitations and uses. Think of the forms you decide upon and then confine your work within the limits of the materials you select; but do not think that perfection of material and workmanship will atone for feebleness of design.

Make up your mind first of what you will build with—whether your walls shall be of rubble or ashlar or your roofs covered with tiles or slates. If of brick, confine your design to the limits of that material. If you employ plaster, remember it requires to be used broadly and simply. Abhor shams of every kind.

Note the ways in which others have produced effects, for it is only by continually absorbing work both old and new that your own will be made estimable. Avoid all tricks and mannerisms, and remember that it is the essence of good architectural drawing to make it intelligible to the workman who will be required to carry it out. It is an admirable plan to try to picture in the mind's eye the finished work. If you train yourself to do this you will be surprised to find how helpful the practice is. Then, after thinking out the mass, study the detail. Detail makes perfection and you should endeavour to make your work as perfect as possible in every way. Remember that eccentricity is not synonymous with genius. In architecture and decoration there is a strong movement throughout the country not only to treat material sensibly but to exhibit a freshness in treatment. Servile imitation is a disease. We need a revival of the old simple forms and feeling with the addition of the knowledge to-day. But guard against being too original, else you will stand in danger of getting into the slough of the New Art, with its crawling line, and its treatment of wood and stone as if they were copper wire. Ornament must follow construction; and though the tendency is to be original yet I think that much of what we see around us is only ephemeral. Many of those who condemn our modern architecture, and point slightingly to the past, forget that the old builders had not the same difficulties to confront which we have—the needs of to-day, the use of iron and steel, the limitations imposed by towns—all these things have to be considered in forming a judgment.



Think over these matters and remember, above all, that your designs should be honest endeavours to adapt our art to everyday requirements, and that we should try to make them a real benefit and force in the architecture of our day.

Mr. Leonard Stokes's Remarks.

Mr. Leonard Stokes, who spoke from a few notes which he had hastily jotted down, said:—Mr. Prior believes that design cannot be taught. Doubtless that is true, but you can learn a good deal about design. Mr. Prior's theory is that it should grow spontaneously, but few things do that. Wild flowers that are cultivated produce more glorious effects, and wild fruit trees become more fruitful by being pruned. I think we may consider that the young student represents, more or less, the young crab apple tree on to which we proceed to graft some of the knowledge of the gnarled oak: and the vigour of the crab-apple will surprise everybody.

The object of this class is to assist the students in the study of design, and perhaps that will meet Mr. Prior's difficulty. I think so much of the present tendency is to cram for everlasting examinations. Students would do themselves much more justice if they did not think of qualifying for some examination by some particular month. Learn all things thoroughly—after all, you are preparing yourself for a future career, not for an examination.

Proportion, I think, is one of the principal

things in design. If you get this correct—not necessarily according to any particular rules—then you can proceed to the detail; and that should not be mass of crudeness, but sparing and refined, for one of the great difficulties is to know what to leave out.

If you are sketching, try to do without your india-rubber—your sketch will be all the cleaner and better; but, on the other hand, in designing it is invaluable—in fact, I don't know what we should do without it. As regards measured drawings, I think the student would do well to confine himself to measuring every building that he admires, not simply for the sake of making a pretty drawing, but to learn its secrets and apply them to his own work.

Good new work will teach you very nearly as much as old work. If you study only the old you will have all the difficulties of to-day to work out for yourself, whereas by studying modern work you will find some of these difficulties already solved. As regards materials, it is a great pity that architects should so jump from one material to another, for in this way a design is spoiled which might have been satisfactory if carried on in a proper manner. If you have to design a brick and stone building you must limit yourself to some treatment which will not produce a lot of irritating lines.

This class of design has one particular use—there is a certain amount of beastliness in all students, and it is a good thing to work it off on the class of design, where, so to speak, they throw off the rash; and, if Mr. Hare will forgive me, I think that is another use for competitions. Judging by some I have seen I think it is well for themselves that the gentlemen should have had that bad attack.

Don't study old work in small fragments—when making a study of a door, for example, see that you examine the inside as well as the outside. Take in things as a whole, and if you cannot measure a building sketch it, but put dimensions on your sketch and you will find them invaluable. A friend of mine says he always designs to $\frac{1}{8}$in. scale. That is a fatal practice. Do not adopt it, but keep your ideas larger and broader.

Mr. Dawber had spoken of originality. It may be very original, but you do not want any of the "Art Nouveau." Digest and study what has been done before you on recognized lines, and follow the principles there exhibited. The study of works in progress is also most valuable to the student. Get out of your $\frac{1}{8}$in.-scale offices and on to the building, and then learn how the work is carried out.

The chairman thought, of all that had been said, quite the most important was that relating to simplicity. The greatest difficulty a young man had was to keep his work simple. If they studied some of the old buildings and put them down on paper, it was astonishing how simple they looked, and in this connection he cited the garden front of St. John's College, Cambridge, and Trinity College Library, Cambridge.

Mr. H. H. Statham also spoke, and the vote of thanks having been passed the meeting terminated.

The subject set for the advanced class of design is "A Market Hall for a Small Village or Market Town"; and for the elementary class, "A Stone Summer-House."

A new Workhouse and Infirmary at Southmead has been erected for the Barton Regis Board of Guardians. The site occupies 13$\frac{1}{2}$ acres and the outlay on site and buildings has been £33,000. The joint architects were Messrs. W. H. Thorp and A. P. J. Cotterell. The contractors for the boundary wall were Messrs. W. & J. Bennett; for the main buildings, roads and paths, Messrs. Forse & Son; and for the drainage, Mr. Marshall Lovell.

WHAT UNDERLIES VENICE.

Some Observations by a Geologist.

A "D.Sc. in Geology" writes to the "Morning Post" in reference to "The Cracks of Venice" (see p. 143 of our last issue). The following are some extracts from his letter:—

So far as I have read no one seems to have grasped thoroughly the geological factors of the problem which is now forced on the attention of engineers and architects. Some years since a series of papers by Professor Sacco, of the University of Turin, threw great light on the geological structure of the Po Valley. . . . . Professor Sacco's papers show that since early tertiary time . . . . the valley as a whole has subsided . . . .

As the result, those portions which lie on or near the east and west median line (as Venice does) are situated on some hundreds of feet of alluvial deposits, partly littoral, partly terrestrial, partly riverine. These have been proved in borings for water to a depth of nearly 600ft.; and terrestrial deposits in the form of massive peat-beds have been proved to a depth of 400ft. Here, then, is an important factor of the problem not to be overlooked by those who are in any way held responsible for the safety of the charming lagoon city and its historic monuments. Any engineer with some geological knowledge, who will refer to Fig. 23 of the first volume of the late Sir Joseph Prestwich's "Geology" (p. 85), will, I think, at once grasp the importance of it, and will be inclined to attribute the increased sinkage of the Venetian area of late years to the excessive removal of water from the underlying strata through the numerous deep wells which engineers have sunk, though, of course, other and more general causes have continued to operate in their degree. Earthquakes in the Alps to the north and south indicate certainly that the orogenic movements, to which I have referred, have not yet entirely ceased, but it may be doubted whether they have had any direct effect on the buildings of Venice.

We are told that the foundations of the Campanile were laid on piles driven into solid clay; but we are not told what underlies this clay, though that could be approximately predicated by any geologist capable of interpreting the data furnished by the many well-sections available. Nor are we told what the thickness of that clay may be; whether, *e.g.*, it is comparable with that of the London clay, which supports the great buildings of our Metropolis. Probably far from it. To put it another way, we have no data yet published, so far as I have read, to assure us that more yielding strata below have not undergone compression with the excessive removal of water from them of late years. Such a condition of things would, as a matter of course, lead to a maximum of depression, *cæteris paribus*, where there was the greatest superimposed weight, as in the case of the Campanile with its load of over 11 tons to the sq. ft.

Ruskin in one of his pleasant day-dreams has told us how his imagination led him to see in the present conformation of the floor of the great church of St. Mark the imitation by the architect of the waves of the Adriatic; but, to my mind, when I walked over it more than twenty years ago it suggested the bulging-up of the floor, after the fashion of well-known "creeps" in the disused galleries of old coal mines, by the action of the force due to great superincumbent weight, as that is transmitted through a yielding medium in the direction of least resistance. And I asked myself the question whether the vast weight of the Campanile was not mainly responsible for it, and whether the glorious tower itself must not some day come down or topple over.

LORD ROSEBERY ON THE PASSING OF LONDON.

IN the course of his address before the annual meeting of the London Topographical Society, held at Burlington House on Wednesday last, Lord Rosebery said:—

London is changing before our eyes. It has been changing during the last quarter of a century with inconceivable rapidity, but that rapidity has been almost duplicated and triplicated since the advent of the London County Council. What ancient streets it is going to cut through in that great new avenue for which it cannot find a name; what are to be the demolitions entailed by that anonymous crescent which all the sagacity of our municipal legislators has failed to christen. I do not dare to reckon; but I do not doubt that among my three colleagues in the chairmanship of the London County Council there must be a guilty feeling that at this moment the march of utility is going to stamp out some venerable dwellings, some ancient associations, which dwellers in London would gladly have spared if that were possible.

But as these destructions are inevitable, and must go on with the development of London, surely the least we can do is to preserve for our descendants the exact picture of what was and what has ceased to exist, both in the shape of maps of streets that were and also of representations of ancient and interesting buildings which have been destroyed.

I do not profess to be an expert like Mr. Wheatley or Mr. Gomme, but I never examine a print of an old house, such as Bedford House, in Bloomsbury Square, which has so many political associations, or any sketch of the old Palace at Whitehall, which has almost entirely disappeared—the ground plan of which the Society has produced—I never come across any trivial prints of that kind without feeling a desire that they should be preserved, and so give this Victorian and Edwardian London which we inhabit some flavour or aroma of the historical London of the past, without some knowledge of which, after all, so much of our political history is unintelligible.

If we are to do this, as I think it ought to be done, and as it is not in the least likely that any public body, borough council, or other will spend the rates in doing so, it is necessary that some small nucleus should be formed of people who are earnest in this matter, and who wish to preserve for the instruction of future generations some picture of the fast vanishing London as it is. That is the function which we present to ourselves in the first place. But we also have in view the reproduction of rare maps, of some of which, as Mr. Gomme has told you, only one or two copies exist; and therefore, in the interests of their preservation, it is most desirable that copies should be made by some association or other. Even if no member of our Society wishes to preserve in his house copies of these maps, yet, in the interests of the general public, it is most desirable that they should be multiplied, so that in case of accident or fire the maps may not altogether disappear.

The following resolution was passed at the meeting: "That this Society strongly urges upon the London County Council to systematically preserve objects and places of historic interest to Londoners under the powers conferred by the Acts of 1899 and 1900, and in particular expresses the hope that the new street from Holborn to the Strand may not be proceeded with until efficient steps are taken to preserve relics and objects of interest and to put on record the particulars of their locality."

CONWAY SUSPENSION BRIDGE.

PROPOSALS BY THE CORPORATION.

THE Conway Corporation recently held a private meeting to discuss what should be done in regard to the Suspension Bridge built by Telford over the river. In 1878 the Government Office of Works offered to sell the bridge, and an effort was made to induce the county authorities of Denbighshire and Carnarvonshire to purchase it. At that time the tolls only yielded £480 per annum, and the bridge was debited in the books of the department with a capital of £450,000. The counties regarded the concern as a doubtful speculation, and refused to have anything to do with it, though it was clearly their duty to acquire it and throw it open to the public as a county bridge on the main road along the coast. The Corporation of Conway offered to participate in the purchase, and the Llandudno Commissioners were asked to join, but they, too, were shy. So Conway made the plunge alone.

The huge capital expended on the work by the Government was due to the great cost of the embankment. A vast quantity of stone was tipped to form this approach to the bridge, and so unstable was the foundation that the embankment sank several times, and it actually cost more than the bridge. On the southern slope of it the London and North-Western Railway Company based the embankment, carrying their line up to the tubular bridge, and paid to the Government £260 per annum for the right to do so. The Office of Works agreed to sell the bridge and the embankment to the Corporation of Conway for £10,000, and the railway company agreed to purchase the right to lay their line on the embankment slope for £6,500, that figure being arrived at on the basis of thirty years' purchase at 4 per cent. An Act of Parliament to wipe out the remaining debit on the books of the Board of Works had to be passed, and another to convey the bridge and embankment to the Conway Corporation as trustees on behalf of the public. These measures cost £1,500, which Conway had to pay. Then something like £3,000 was expended by the Council in putting a new floor on the bridge. This brought the total sum to be provided by the Council up to £8,000, for which sum the bridge was mortgaged to provide the money.

Since that date, owing to the growth of the seaside resorts of Llandudno and Colwyn Bay and other parts of the coast, the revenue from the tolls has quadrupled, and the Corporation have paid off the mortgage and have raised £7,000 towards the capital sum of £10,000 which the Act says shall be accumulated out of the revenue after paying all expenses for maintenance. It is stipulated that when that capital sum is completed the bridge shall be thrown open to the public toll-free, the future maintenance to be paid out of the income from the capital fund. The Corporation have now, quite suddenly, realised that this capital fund is insufficient to provide for the maintenance, though it might have been when the Act was passed owing to the greater yield of invested money at that time. They therefore desire it to be increased to £20,000, and they are going to the Local Government Board for a provisional order to make that charge. They also intend to strengthen the bridge by means of additional cables, &c., at a cost of £6,000 or £7,000, as described on p. 22 of the BUILDERS' JOURNAL for August 27th.

At present extraordinary traffic is not allowed across the structure, so that a heavy road motor or other unusually weighty vehicle must go round by Talycafn or Llanrwst to get over the Conway. Thus the Corporation have to raise £13,000 to complete the increased capital account and, say, £7,000 for the strengthening works, making a total of £20,000. The present lessor pays something like £1,700 per annum for the tolls he collects; and assuming that the maintenance costs £300, and that the Council continues to appropriate to itself the sum of £300, which it has recently resolved upon to meet the cost of management, this leaves a nett income of £1,100 per annum. Should this be realised the users of the bridge will have to continue to pay the tolls for eighteen more years. It may, however, be that before that period has passed the county councils of Carnarvonshire and Denbighshire will realise that it is their duty to take over and maintain the structure as a county bridge.

LONDON'S COUNTY HALL.

£900,000 FOR THE ADELPHI SITE.

AT last week's meeting of the London County Council Mr. J. S. Fletcher brought up the report of the special committee as to the Adelphi Terrace site for a new county hall. He said that the Council had been considering the question of a permanent home ever since its creation in 1888. They had considered as sites Christ's Hospital in Newgate Street, Millbank Prison and the Foundling Hospital. Later the site now occupied by the Hotel Cecil was offered for £400,000, but that and other sites were either rejected by the Council or their Bills were thrown out by Parliament. When, two or three years ago, it was resolved to make the fine street to connect Holborn with the Strand, another favourable opportunity arose for reserving a site for a county hall. Unfortunately, to facilitate the passing of their scheme through Parliament the Council agreed to reinstate the Gaiety Theatre and two other buildings within the crescent area, and had represented that though the improvement would cost about £4,500,000 there would be recoupment of about £4,000,000. That recoupment would have been seriously reduced if the county hall had been placed on the most costly part of the improvement area. The Aquarium site was rejected as wanting in dignity, and another site of four acres, facing the river opposite Lambeth Palace, was abandoned as not sufficiently central, while both sites were too near the Houses of Parliament. The committee now reported strongly in favour of building on the Adelphi Terrace site, which had a central but quiet position in London. The cost of that site (£900,000) was very moderate as compared with other sites, and such a favourable opportunity was not likely to recur for many years. A discussion followed, but on a show of hands the reception of the report was carried by 60 votes to 16.

Mr. Fletcher moved: "That the Council do apply to Parliament for power to acquire compulsorily for the purposes of new offices the properties bounded on the north by William Street, the Tivoli Music Hall and Adam Street, on the south by the Embankment Gardens, on the east by the Hotel Cecil, and on the west by York Buildings."

Dr. Cooper then moved as an amendment: "That in view of the heavy rates now being levied in all the eastern and southern metropolitan boroughs, it is inadvisable to apply to Parliament for sanction to raise the large sums of money which the adoption of this scheme must necessitate until Parliament has given to London some new source or sources of income."

Further discussion took place, but on a division the amendment was rejected by 78 votes to 29.

Colonel Rotton moved the adjournment of the debate, which was agreed to.

The report as to the naming of the new main street from Holborn to the Strand and the new crescent street was withdrawn, and the question will now be referred to the General Purposes Committee. The revived proposal for a tramway over Westminster Bridge and along the Embankment stood over.

BRITISH SCHOOL AT ATHENS.

THE annual meeting of subscribers to the British School at Athens was held last week at Burlington House, W. The report read by the hon. secretary (Mr. William Loring) stated that the work of the School had been carried on successfully under the directorship of Mr. Bosanquet during the past season. Among the students of the School were Mr. C. Heaton Comyn, A.R.I.B.A., and Mr. A. E. Henderson, architect. Mr. Comyn was appointed to an "architectural studentship" in connection with the excavations in Crete. He occupied himself in the neighbourhood of Athens by making a complete set of drawings of the beautiful little Byzantine church at Daou, at the south end of Mount Pentelicus, to which Mr. Bosanquet had invited his attention. Mr. Henderson was readmitted as a student for the third time, for the special purpose of the Cyzicus survey. Of the preceding year's students Mr. J. H. Marshall had been appointed Director-General of the Archæological Survey of India; Mr. Wells had settled down to the practice of his profession as an architect; and Mr. Penoyre had undertaken a course of archæological "extension" lectures. Messrs. Fyfe & Mackenzie, formerly students of the School, had served once more as Mr. Evans's assistants at Knossos.

Passing to the work of the Director, the Committee had to record the preliminary excavation of the early site at Palaeókastro, on the eastern coast of Crete. The excavation was carried out under the supervision of Mr. Bosanquet, with the assistance of Mr. Comyn. The site appeared to have been almost untouched from Mycenæan times until the middle of the last century, and contained abundant remains of houses, large and small, of the Mycenæan period, together with numerous tombs and many hundred vases, both of that and of the earlier epoch. The Director had been busy sorting and preparing for publication the last results of the important excavations at Phylakopi in Melos. The finest specimens of pottery from Phylakopi now adorned the Mycenæ room in the Central Museum at Athens; and a number of duplicates had been brought home to England, by the courteous permission of the Greek Government, and would be divided between the Ashmolean, Fitzwilliam and (probably) the British Museum.

The Committee regretted to have to report a deficit of £164 on the year's working. It was earnestly to be hoped that this deficiency might be speedily supplied by fresh subscriptions.

The chairman (Dr. Thomas Hodgkin) congratulated the meeting on the success of the School. In past times the zeal of archæologists had been somewhat intermittent. Now it was to be hoped that it would be continuous, and that we should not fall behind other nations; and that no Chancellor of the Exchequer would ever lay his lands on the little grant which had been made by the Government. The details known a generation ago of early Greek history were few and uninteresting; Carlyle had bitterly complained of Thirlwall's first volume as nothing but Pelageans and Lalages and Chaireans and Melageans and Dolopes — Dolopes — Dolopes! Now happily that was all changed, and the dry bones was made to live; and it might be that the Pelasgians themselves would be brought into clear historic lines.

Views and Reviews.

Shoring and Underpinning.

The third edition of this standard work upon the subject of shoring and underpinning has just been published. This edition has been revised by Mr. Frederick R. Farrow, F.R.I.B.A., but he has found little to alter. The book deals most thoroughly with the subject, and one of its best features is, that abstruse theoretical discussion of the mechanical principles involved is relegated to a separate chapter and is not made necessary to the intelligent understanding of the general principles. In ordinary practical work it is more usual to proceed by rule-of-thumb methods, which are quite efficient enough for the somewhat elementary works of shoring. Of course on occasion it is necessary to go into things more thoroughly, but this is for the expert. One of the most useful chapters in the book is devoted to the shoring and underpinning of mediæval buildings. This is, perhaps, the most ticklish work there is of the kind, and the avoidance of any unnecessary damage is most important, for damage to an old structure is irreparable, however careful may be the restoration.

"A Treatise on Shoring and Underpinning, and generally dealing with ruinous and dangerous structures," by Cecil Haden Stock. Third edition, revised by Frederic Richard Farrow, F.R.I.B.A. London: B. T. Batsford, 94, High Holborn, W.C. Price 4s. 6d.

Glasgow and West of Scotland Technical College.—The annual report for the past year contains nothing new of importance, but the standard of work has been well maintained. Towards the new buildings fund £176,173 has been collected, and contracts amounting to about £130,000 have been entered into.

THE MANCHESTER TECHNICAL SCHOOL.

THE Municipal School of Technology, Manchester, was opened by Mr. Arthur Balfour last Wednesday. The legatees of the late Sir Joseph Whitworth gave a sum of £5,000 and a plot of land 6,400 sq. yds. in extent, situate in Sackville Street, for the purpose of erecting the school, to which the Corporation added a further area of 900 sq. yds. In 1895 the building of the new school was begun, and from that time to the present the building and the equipment of the new school have been in progress. In addition, the Committee are erecting on a plot of land 1,248 sq. yds. in area, close to the main building, a commodious dyeing, bleaching, printing and finishing house for textile goods, and for the manufacture, dyeing and finishing of paper. The new building is of imposing proportions, and is one of the largest buildings of the city. It is oblong in plan, and comprises six storeys, the corridors on each floor being lit from two spacious areas, whilst the classrooms and laboratories are all lit from the outside. The chief and practically the only public entrance is in Sackville Stree, leading to a spacious entrance hall 4,000 sq. ft. in area and thence to the main staircase, there being two subsidiary staircases, each containing a lift, giving ready access to the rooms on each floor. Over the entrance hall is an examination and public lecture hall of the same area, and above it a commodious chemical laboratory. The basement is one great workshop and laboratory for spinning and weaving, and mechanical, electrical, steam and hydraulic engineering; whilst throughout the building extensive laboratories and workshops are provided for chemical, physical, metallurgical and sanitary work and investigations. A extensive library is provided. The building erected after the designs of Messrs. Spalding & Cross, of London, by Messrs. Robert Neil & Sons, of Manchester, is constructed terra-cotta and Accrington bricks in th French Renaissance style. The school i designed to accommodate the mechanical electrical and sanitary engineering industries the chemical and textile industries: th building and printing trades; and many minor trades and industries. The value o the sites, structures and equipment of th two buildings will be nearly £300,000. The syllabus of the school is published by Mr. John Heywood, of Manchester, price 6d. and forms a large volume. Lectures o architecture and building are given by Mr. J Wilson and Mr. A. E. Corbett, A.R.I.B.A The illustration on this page was drawn by Mr. Hedley Fitton, and is published in th syllabus.

THE NEW MUNICIPAL SCHOOL OF TECHNOLOGY AT MANCHESTER. SPALDING AND CROSS, ARCHITECTS.

Kirklington Church, about nine miles from Carlisle, has been reopened after undergoing extensive interior repairs and decoration at a cost of £1,150. The work included the re-seating of the church, chancel and choir, the putting up of a fresh ceiling in oak, the introduction of a new pulpit and other necessary fittings, and the re-painting and decorating of the whole of the walls.

A new Town Hall at Marlborough has been erected to replace the old one. It is in the Late Renaissance style and is of red bricks, with Ham Hill dressings and cream-tinted rough-cast for the upper storey. The roof is a high-pitched one, with broad eaves, and covered with dark red tiles. Mr. B. Hillier, of Marlborough, was the contractor, and Mr. C. E. Ponting the architect. The amount of the contract was £7,500, but this has been exceeded.

ARCHITECTURAL ASSOCIATION.

HOMER AND ARCHITECTURE.

By T. R. SPENCE.

A MEETING of the Architectural Association was held on Friday evening last at No. 9, Conduit Street, W., Mr. Henry T. Hare, F.R.I.B.A., presiding. The adoption of the annual report and balance-sheet was proposed by Mr. C. H. Brodie and seconded by Mr. G. F. Hooper. This was carried unanimously. The following were then elected members:—Messrs. Cecil G. Hare, Herbert C. Ingram, W. Paul, A. S. W. Mackay, Hugh J. Scott, A. Tudor Groves, R. M. Butler, Andrew N. Prentice, Stephen J. Adams, W. J. Feare, Solomon Ford, T. W. Fullerton, R. C. Foster, H. H. Whittington, Noel A. F. Haslewood, E. R. Nixey, Richard Tasker, Maurice E. Webb, E. J. Whitley, F. E. Whiting, A. Clavel Withers, J. W. Waite, George Vey, W. N. Couldrey, B. Chaikin, A. A. Hands, W. T. Temple, Alan Binning, Hamilton Reaney, A. M. Millwood, P. O. Dunk, C. Gascoyne, S. W. Hill, J. R. Osborn, M. R. Martin, P. H. Topham, E. F. Ferry, A. E. Mumby, A. Horsnall, G. F. Royds, T. C. Pope, C. M. Harris, T. S. Atlee, W. G. de M. Wilkinson, J. H. Markham, Louis Cohen, C. A. S. Vardy, W. Whymper, W. K. McDermott, G. D. Clunies Ross, G. G. Sigismund and L. Morgan.

Mr. T. R. Spence then read his paper on "Homer and Architecture and the Crafts," of which the following is a summary:—

The aim of this paper is not to enter into vexed questions of archæology or the latest discoveries relating to archaic art and their relation to the life of Homer. It is more in the nature of a fairy journey with him, noting the delicate and subtle suggestions on architecture and the crafts which interlace the expression of his joy in battle, and the lovely sea and land in which is set the story of his characters. He was the seer who "dipped into the future and saw the wonder that would be," for, we may take it, the art he described was more in the sense of a vision of its fruition. He gave in literature what Phidias gave in marble and metals. May not archaic work be the strenuous childhood of effort to materialise the conception of the seer? and only when Phidias came did his ideas reach their permanent ripeness and fulfilment. How well he has suggested in the Odyssey a broad conception of architecture in speaking of shadowy halls, echoing galleries and fragrant chambers, and the value of the bath. His genius seems to have indicated most of the things in architecture and its accessories which are acceptable to those who find their joy in this great art. Any discussion on Homer and architecture really embraces

All that is best in Greek Art.

So that the subject is a vast one. It is like accepting a brief for the scheduling of all that adds to the beauty and refinement of life in architecture. Of course, I mean one phase of architecture only, and my reverence is equally great for many others of widely distinct periods of expression in form and treatment. The architecture that Homer gives largely appertains to stately dwellings; it is the hope of all students that commissions for such will reach them sooner or later. Recently architecture has suffered somewhat from persistent efforts to graft on to that architecture, which should be spacious, large, and dignified, such forms, shapes and dimensions as appertain to the cottage or kitchen furniture.

Homer's appreciation for the decorative details of marble, colour, metals, &c., associated with architecture, seems to run on true schemes of harmony. Their gamut is not large (probably the better for that), and consists of gold, silver, ivory and bronze, so that you feel he was familiar with the refinements of life and free from the tyranny of the commonplace. His heroes, during the delight of battle, were decked with magnificent beaten armour, ornamented in *repoussé* of gold and silver; some descriptions of such are quoted later, and we only need to refer to vase paintings, &c., to see how good was the general scheme of the armour of the best Greek period. In the "Iliad" we find the first reference to architecture in a suggestive passage on Priam's palace, "adorned with polished colonnades—and in it were fifty chambers of polished stone, builded hard by one another, wherein Priam's sons slept . . and for his daughters over against them, on the other side within the courtyard, were twelve roofed chambers of polished stone, builded hard by one another."

Hephaistos plays a great part in the arts, he being the great craftsman in metal in the house of the gods. His own dwelling is described as being imperishable, star-like, a house of bronze worked by the crooked god himself, where he forged "tripods, twenty in all, to stand round his hall, and beneath the base of each he had set golden wheels, that of their own motion they might enter the assembly of the gods and again return unto his house, a marvel to look upon: this much were they finished that not yet were the ears of cunning work set thereon—these he was making ready and welding chains," &c.

The description of the shield of Achilles is carefully detailed at some length, and gives, with a keen insight, all that goes to make magnificent subjects illustrating such incidents as embrace all those elements which are decorative.

In the Odyssey

we learn more of the arts that appertain to home life and its hospitality; the provision for these things is mainly the architects' function, so that we may not pass them over. Bathing and anointing with olive oil and sweet herbs ended all fatiguing journeys and preceded all feasts. Much was made of guests arriving from either peaceful or warlike expeditions. They were led into the hall. "They sat down orderly on seats and high chairs, and when they were come the old man mixed well for them a bowl of sweet wine, which now in the eleventh year from the vintage the housewife opened."

When Telemachus was welcomed at the house of Menelaus by his wife we find the following: "Helen bade her handmaids set out bedsteads beneath the gallery, and fling on them fair purple blankets and spread coverlets, and thereon lay thick mantles to be a clothing over all. So they went from the hall with torch and spread the beds, and the henchmen led forth the guests. Thus they slept there on the outer gallery of the house—the hero, Telemachus, and the splendid son of Nestor.

Again, when Telemachus and his men had "tilted his chariot against the shining faces of the gateway, and led them into the hall divine, and they beheld and marvelled as they gazed through the palace, for there was a gleam as it were of sun or moon through the lofty palace of renowned Menelaus. But after they had gazed their fill, they went to the polished baths and bathed them. Now when they had bathed and anointed them with olive oil, and cast about thick cloaks, they sat on chairs by Menelaus, and a handmaid bore water for the hands in a goodly golden ewer and poured it forth over a silver basin to wash withal, and to their side she drew a polished table and laid upon the board many dainties."

Throughout the whole of Homer's writing there is evidence of a close acquaintance with the treasures of art of many races, and the examples of these may have fired his imagination. Many quotations might be given from the "Odyssey," but probably the following will suffice as bearing on architecture:—

"Meanwhile, Odysseus went to the famous palace of Alcinous, and his heart was full of many thoughts as he stood there, or ever he had reached the threshold of bronze, for there was a gleam, as it were, of sun or moon through the high-roofed hall of great-hearted Alcinous. Brazen were the walls which ran this way and that from the threshold to the inmost chamber, and round them was a frieze of blue, and golden were the doors that closed in the good house. Silver were the doorposts that were set on the brazen threshold, and silver the lintel thereupon, and the hook of the door was gold. And on either side stood golden hounds and silver . . . . and within were seats arrayed against the wall this way and that from the threshold even to the inmost chamber, and thereon was spread light coverings thinly woven, the handiwork of women . . . . Yea, and there were youths fashioned in gold, standing on firm set bases, with flaming torches in their hands, giving light through the night to the feasters in the palace. And he had fifty handmaids in the house, and some grind the yellow corn on the millstone, and others weave webs and turn the yarn as they sit restless as the leaves of the tall poplar trees, and the soft oil drops off that linen, so closely is it woven . . . And without the court hard by the door is a great garden of four plough gates, and a hedge runs round on either side, and here grow tall trees blossoming, pear trees and pomegranates and apple trees with bright fruit, and sweet figs and olives in their bloom. The fruit of these trees never perisheth or faileth, winter nor summer, enduring all through the year evermore; the west wind blowing brings some fruits to birth and ripens others. Pear upon pear waxes old, and apple on apple, yea, and cluster ripens on cluster of the grape, and fig upon fig. There, too, hath he a fruitful vineyard planted, whereof the one part is being dried by the heat, a sunny plot on level ground, while other grapes are gathering, and yet others they are treading in the wine-press. In the foremost row are unripe grapes that cast the blossom, and others there be that grow black to vintaging. There, too, skirting the furthest line, are all manner of garden-beds planted trimly, that are perpetually fresh, and therein are two fountains of water, whereof one scatters his streams all about the garden, and the other runs over against it beneath the threshold of the courtyard and issues by the lofty house, and thence did the townsfolk draw water."

It seems to me that

The Architect Ictinus and Phidias

have petrified the dreams or prophecies of Homer, so that we can in a measure believe they were one in architectural design, the one finding his expression in words and the other in such material elements which embody architecture and give it a local habitation and a name.

It should be our function to gather the threads together of what makes Greek art so great, and I can only indicate some things which occur to me as evidence. From what I have seen in Greece the perfection of the workmanship of every detail in the architectural remains is very patent—from the perfect arises of fillets and flutes of the immense Doric columns, the soft and accurate curves of the volutes in the Ionic caps, the daintiness, finish and shape of the egg-and-tongue and other details of acanthus leafage on horizontal mouldings: the fine sinuous uniting curves, and relief of the acanthus when used in larger and detached forms; the true and delicate contours of their mouldings and the juxtaposition of larger flat curves with smaller incised and sharply cut members; the sense of decoration they get in soft horizontal lines of shadow being picked up and

accentuated by the sharp incisive darks below; the evidence of

Reserve in the Disposition of Ornament.

If their ornament was full of nice detail so was it laid on a quiet field, and thus lost none of its value. This vignetting of the sculptor's jewels is a most commendable feature in architecture.

Notice the satisfactory way in which their bas-relief panels filled up the space they were to adorn—the subject filled the space fully and with dignity, the heads not slipping far below the top moulding. What could be better in this respect than the frieze of the Parthenon. In their groups of ornament note, notwithstanding much small work in parts, running through are always larger curving, uniting forms so that the general effect is in no way belittled, but delicacy and breadth of expression is maintained.

Our incomparable British Museum is a treasure house of Greek art, and there you may note how satisfactorily many things relating to architecture are accomplished. See how the groups of sculpture in the Parthenon pediment fill the triangular space and, as you may know, this has not always been done in modern buildings with success. The high reliefs of the figures in the metopes show a fine expressive crispness suitable to their position. The frieze, which of course, comes within the shadow, has a treatment of another kind, comparatively low in relief, yet giving a fine sense of breadth and refinement. At the first glance you think that

The Great Purple Shadows

on Greek architecture are lightless, but on examination, such is the quality of the irridescent light, innumerable soft reflections play on these reliefs and give them more definition and harmony. Well, in such juxtapositions, where two ways of treatment are involved, the result is an added value to each form of detail. This also applies to mouldings and other forms of decoration. The architects of the Italian Renaissance have treated the ornamentation and profiles of mouldings with a charming variety and liberty. Mino de Feisole is about the best in this way. Yet do not start from Mino de Feisole in your efforts to add further interest to such detail; rather add your invention to the purer Greek forms.

It may be contended that there is not much to be learned of architecture proper from Homer, yet I venture to think that what he says of it is of significance and interest to those practising this art, for by that means they will be led to take a deep interest in the efforts of later Greek architects and artists to illustrate or build up into permanent form his imagery. The examination of their achievements will result in an education.

Please do not think that your task is to reproduce only from the cells of memory the best details of the Greek or any other period; but think how much can be gathered from their sense of proportion, the value of plain spaces, and the vignetting and placing of such adornments as their sculptors, painters and metal craftsmen could supply.

Costume of the Greeks.

To me the clothing of the Greeks ranks, as costume, very high, if not the highest, as a motif for the architectural sculptor. It does not seem an invention of pushing tailors. It is of the simplest construction, and follows and accentuates all the sinuous motions of the figure. Its lines are endless in variety, and can be governed by and made subservient to the sculptor's aims. The best mediæval costumes bear a close relationship to those of the Greek. Then, again, the symbols of their religion as seen in the Parthenon frieze are of refined and decorative forms.

We gather from Homer a fine sense of site for his architecture, as he mentions in his descriptions of the House of Alcinous as having a fair prospect. Then, again, a later writer speaks of Athens as the "city of the violet crown," the crown being the Parthenon. I can speak from experience of the site of the House of Agamemnon on the lower spurs of the mountains of Argos. Behind are the higher peaks, and far away below stretch the plains of Argolis—as Homer phrases it, the pasture land of horses—and beyond the boundaries of this plain lies the blue shimmering bay of Nauplia. On speaking of

Greek Landscape,

with its long, horizontal lines of blue seas and grey-green plains, from the boundaries of which rise the broad and dignified mountain forms, all bathed and united in the iridescent air of that divine land, makes it an unequalled source for instilling into an architect such a sense of colour for decorative purposes as cannot be obtained from text-books of coloured ornament.

This reference to landscape may seem a wandering away from architecture, but no source of inspiration is unworthy. Most architects have a deep interest in interior colour, but many cherish as their only idols schemes of grey-greens and reds, avoiding that which is sumptuous in colour. When you get over the wall of the Swiss Alps revelations come upon you that the diffused purple has harmonies equally beautiful. In Greece all the greens, blues and greys, &c., seem to be steeped in a bath of purple. This veil of purple iridescent atmosphere is the magician which assimulates and brings all local colour into decorative completeness. Unfortunately we cannot bring the quality of the sunlight here, but, still, remembrance of these things has an educational value.

My remarks may have been of a wandering nature, but apart from the science and ever-changing needs of architecture it is a great and beautiful art; and to give it that crown of art or beauty, air of distinction or style, some little deviation in the side paths of the softer emotions cannot be a fruitless journey. Whatever may be the perfection of the anatomy of the parts of your architectural work, it can never suffer from wise and restraining disposition of its bejewelling. Frankly, a great architect must possess many gifts. He must have that which is generally known by the words common sense; it is rather a clumsy phrase, which means so much, for it really embraces a subtle practical wisdom, a sense of winnowing the wheat from the chaff, and, as far as architecture is concerned, a thinker in building material rather than pencil. I venture to say he must have added to these qualities the instincts of a poet to finally set that seal of completeness on his conception which makes a work of art.

Discussion.

Mr. John Slater, B.A., in proposing a vote of thanks to the reader of the paper, said that from the excavations made by Schliemann we knew the plan of a Greek house, but not much about the interior. Schliemann had found that city after city had been built upon the other on the same site, and he thought much the same had occurred in Homer's poems. Bards had handed them on by word of mouth, and in this way accretions would come to the original poems. He did not consider the descriptions of architecture should be taken literally. He agreed with Mr. Spence, as to the advantage which the study of Greek architecture was to the student.

Mr. R. Phené Spiers seconded the vote. He thought Mr. Spence had taken the right line in stating that building construction, specifications, &c., were not everything, but that there were higher ideals. He was of opinion, with Mr. Spence, that Homer's ideals in art was to be seen realized in the later work of Phideas and his contemporaries, for the architecture of Homer's day must have been very barbaric. With regard to the word translated "amber" in one of the descriptions from Homer he thought this was not amber, but a metal, probably an alloy of silver and gold.

Mr. J. D. Crace and Mr. Hare also spoke, and Mr. Spence briefly replied. The meeting then terminated.

CONCRETE AT DUSSELDORF.

"'BETON,'" says "Engineering," "means on the Continent what is usually called concrete in this country. But the term has a very different ring over there. Here the word suggests foundations and dams. In Germany, as in France, whole works, bridges, hotels, churches and monuments have been built in cement and beton; and the visitor to the Düsseldorf Exhibition would not suspect that the beautiful columns, their capitals and reliefs, the statuary, the bridge and flight of stairs, are really all worked in beton, however much they resemble sandstone, marble and granite. The foundations of the columns in the Exhibition, which have a total height of 115ft., go down to 18¼ft. below the surface, and consists of concrete blocks 42ft. 7in. square, 55in. in thickness, made of 1 part cement to 10 parts of gravel, and containing a grid of I-irons. The capital, 18ft. in height, is made up of rings and of four blocks, held together by iron anchors. The capital is crowned by a metal dome and by a figure of Victory. The various beton mixtures were examined at the Royal Testing Station of Charlottenberg; the 1 in 10 mixture was in test-blocks seven weeks old, crushed by loads varying from 286lb. to 330lb. per sq. in.; while the 1 in 7·5 mixture bore 315lb. The bridge, 98ft. span over the basin, is remarkable for its small rise of only 2 metres, that is, one-fourteenth of the span. The ground was by no means favourable; the foundations go down to a depth of about 17ft. Before the opening of the Exhibition the bridge was loaded with a 27-ton steam roller and a crowd of people, equivalent to a weight of 92lb. per sq. ft."

Bolton Hall, Yorkshire, was practically destroyed by fire last week. Most of the valuable pictures, furniture, &c., were saved.

At the East United Free Church, Aberdeen, a large organ recently erected, the pulpit, and a carved screen were destroyed by fire last week. The organ and screen cost over £1,500, and the church itself has been greatly damaged.

Richmond Bridge.—The Richmond Town Council have decided by a majority of one to postpone the proposal that the council should ask the Surrey and Middlesex County Councils to build a new bridge over the Thames at Richmond, on the ground that the existing bridge was unsuitable and dangerous.

A Wesleyan Church at Churchdown, Cheltenham, is being erected near Drew's Court Farm. The plan is L-shaped and includes church and school combined, being designed for use separately or together, and having a total accommodation for about 200 persons. Plain Early English style is adopted, and the materials used are hammer-dressed Painswick stone with Bath-stone dressings. The roof will be covered with green slates, and a stone tower and spire will be erected over the entrance porch which gives access to the church, and also to the schoolroom or lecture-room. The floors will be of wood blocks, and the walls finished internally with sand-faced cement dados and oak mouldings, with the upper portion finished for tinting. The roof will have hammered-beam principals, stained dark. The seating will be of oak or pitch-pine, and the windows and screens of lead glazing. The architect is Mr. J. Fletcher Trew, M.S.A., of Gloucester, and the builder Mr. William Jones, also of Gloucester.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Camera-Obscura on a Building.

DOLGELLEY.—C. H. S. writes: "How should a place be constructed for a camera-obscura on the top of a building?"

All that is required is a small circular room, absolutely light-tight, with door fitting in a rebated frame felt-lined to exclude light. A circular table is fixed in the middle of the room, and painted white, while over the centre of the table is a vertical circular hole in the roof in which the revolving mirror can be inserted. Any optician or lantern manufacturer would construct the mirror with the necessary simple mechanism for its revolution, if supplied with the plan and section of the room, and would advise as to size and height of table. G. A. T. M.

Copyrighting Architectural Plans.

LEIGH.—PONS writes: "Is there such a thing as copyright in architectural plans?"

It is not possible to copyright an original architectural plan; but a lithograph that has been circulated, or a published reproduction, may be copyrighted as a "book" on payment of the fee of five shillings. If published during your lifetime the term of copyright would last for forty-two years from the publication of the plan or the period of your life and seven years from your death, whichever is the longer term. If published after the author's death, then the proprietor has copyright for forty-two years from the first publication. A "book" cannot be registered before it is published. An elevation of a building would need to be registered as a "picture." Full instructions as to both procedures can be obtained by application to the Registrar, Stationers' Hall, London, E.C. To secure copyright in Great Britain of works intended to be published in America and other foreign countries (except the Kingdoms and States represented in the Austrian Reichsrath) which have not adopted the provisions of the Berne Convention, simultaneous publication in both countries is essential, and the work should be registered at Stationers' Hall and one copy delivered to the British Museum, and four copies lodged at Stationers' Hall for the public libraries.

Fixing Shear Legs.

NEWPORT, MON.—A. S. M. & Co. write: "A question has arisen with respect to the proper method of fixing a shear legs (height 16ft.) on a tall chimney. The scaffold consisted of staging fixed inside the chimney (about 20ft. in diameter), a manhole about 6ft. square being provided in the middle. The apex of the shear legs is directly above the middle of the manhole, and the three legs of the shears rest in sockets in the staging. An accident occurred through the carelessness of the men in lifting a stone, by which the shear legs swung out of its sockets and struck a man, thus injuring him. Was sufficient precaution shown in placing the shear legs in sockets? Is it the usual trade custom in such cases to bolt the shear legs to the staging? What is the proper method of fixing such shear legs?"

The writer has never seen shear legs fixed in their sockets, although he has used them on all sorts of jobs. With ordinary care there is no tendency for a leg to come out of its socket, but it is frequently necessary to hold the footing piece containing the socket in place. In any given case everything depends upon the exact conditions as to whether the shear legs are properly fixed and used. HENRY ADAMS.

Filtering Water for Concrete.

BELVEDERE.—J. P. writes: "How can river-, rain- or well-water be filtered so that it can be used for mortar or concrete or artificial stone-making? How can water be tested to ascertain whether it contains anything injurious to its use for these purposes?"

Generally speaking, any of the waters named would be sufficiently pure for making mortar, concrete or artificial stone without any preparation. In times of flood river-water becomes turbid through mud carried down, but this soon goes to the bottom if the water be left undisturbed in a settling tank. The best test for any given sample of water is to use it in mixing cement briquettes for testing in a machine, and then to note the effect, if any, in lowering the tensile strength. The dissolved impurities may be ascertained by evaporating a given quantity of water and weighing the residue. A sand filter-bed may be used for purifying on a large scale, but it would probable be unnecessary. HENRY ADAMS.

South Africa for Architects' Assistants.

T. D. L. writes: "As an architect's assistant anxious to obtain a berth in South Africa I should be glad to have some information on the subject."

Read the article on p. 141 of our last issue.

Maximum Age for Clerk of Works.

NEWPORT, MON.—N. C. B. writes: "What is considered to be the maximum age at which a clerk of works might apply for an appointment?"

There is no limit of age for an architect's clerk of works. It is a question more of physical capacity and other things. As engagements are usually for one building or one job only, and subject to a month's notice, age is not so important as with estate clerks of works, whose engagement, being usually of a permanent character, fixes the limit at about 45 to 50 years. T. P.

Books on Architecture.

GATESHEAD-ON-TYNE.—F. H. P. writes: "What book on architecture, price about 7s. 6d., would you recommend for study and reference?"

We recommend Banister Fletcher's "History of Architecture" (B. T. Batsford, 94 High Holborn, W.C., price 21s.); but two books also to be recommended are "Classic Architecture," by T. Roger Smith and John Slater, and "Gothic Architecture," by T. Roger Smith and R. E. Poynter, published by Messrs. Sampson, Low, Marston & Co., Ltd., price 5s. each.

Books on Modelling.

ALDERLEY EDGE.—MODELLER writes: "Please name a cheap book on modelling in clay—architectural subjects principally."

We know of no cheap book. "Modelling," by E. Lanteri (Chapman & Hall, Ltd., price 15s. nett), is the best work on the subject, but there is a useful chapter on modelling from its more architectural side in Millar's "Plastering—Plain and Decorative" (B. T. Batsford, 18s. nett).

Parish Rooms at Braunton have been erected on Dean's Close, adjoining the Vicarage, and within a stone's throw of St Brannock's Church. The buildings consist of a large lecture hall, 55ft. by 25ft., with platform, seating about 300, with classrooms and offices. The stone was given by the churchwarden, the cartage done by another parishioner without charge, and the architect engaged by a third. Mr. Southcombe, of Barnstaple, was the architect, and Mr. Harry Slee, of Santon, the contractor.

Builders' Notes.

The Builders' Benevolent Institution.—An election of pensioners will be held in December at the offices, 31 and 32, Bedford Street, Strand. Applications must be received at the offices by October 27th.

The Southampton Steam Joinery Works, at Northam, were burnt down last week. Damage to the extent of £12,000 was caused, and over one hundred hands are thrown out of employment. Much valuable machinery was rendered useless.

Woolwich Municipal Buildings. — The Woolwich Borough Council at its meeting last week accepted the tender of Messrs. Johnson & Sons, of Leicester, to erect municipal buildings in Wellington Street, Woolwich, at a cost of nearly £51,000. This amount is exclusive of the cost of the site. A proposal to add a town hall to the buildings at an extra outlay of £9,000 was defeated by 21 votes to 9.

Partnership Dissolved.—The partnership heretofore subsisting between Messrs. Thomas Baker Davis and Edward Arthur Chamberlain, carrying on business as builders and house decorators at No. 48, Newcomen Street, Southwark Street, London, under the style or firm of Davis & Chamberlain, has been dissolved by mutual consent as and from July 30th. All debts due to and owing by the late firm will be received and paid by Mr. Edward Arthur Chamberlain.

Working Men and Rifle-Shooting in Winter. — Lieut.-General F. Lance, C.B., draws attention to the Society of Working Men's Rifle Clubs, of which Earl Roberts is president. To establish a rifle club fully equipped with the apparatus recommended, rifles, &c., a hall or room 40ft. or more in length is required, and a sum of £15 will more than cover the initial cost; whilst, without the apparatus, a small club could be started for £5. The profit on the sale of ammunition and a small subscription from members will cover the cost of maintenance. The committee of the Society has just published a little book showing the best means of forming and conducting a miniature rifle club, and a copy will be gladly sent free of charge to any person interested in the subject. (Offices: 17, Victoria Street, Westminster.)

The International Fire Exhibition at Earl's Court, 1903.—At the executive meeting of the British Fire Prevention Committee last week the announcement was made that the Committee's preliminary arrangements for the International Fire Exhibition had been completed and the general programme finally decided upon. An eminently influential Advisory Council, representative of the great technical and fire interests, and headed by the President of the Royal Society and presidents of the leading scientific institutions, has now been duly constituted and the various working sub-committees are in course of formation. The hearty co-operation of the Duke of Marlborough, K.G., president, and the leading members of the National Fire Brigades Union, the officials of the Private Fire-Brigades Association and St. John Ambulance Association has been assured, whilst the various Continental fire authorities have promised active assistance. The preliminary work for the Fire Congress to be held next year at the time of the exhibition has also now been started under the direction of Mr. Edwin O. Sachs, chairman of the Fire Prevention Committee. A number of most important questions will be discussed at this conference, at which the leading authorities of all countries will be represented. The exhibition will have the advantage of eminently interesting exhibits in the way of modern constructional and engineering work and the latest fire appliances, as well as historical relics, &c.

Mr. F. Towl, of Walthamstow, has been appointed building inspector and clerk of works to the Woodford District Council.

Fireproofing.—The Columbian Fireproofing Co., Ltd., of 37, King William Street, E.C., have just obtained the contract for fireproof floors and roofs for the large bakeries at Fulham for Messrs. Macfarlane, Lang & Co., of Glasgow, as well as for branch banks at Manchester and Deptford for the London City and Midland Bank, of Threadneedle Street.

Associated Portland Cement Manufacturers (1900), Ltd.—The second annual report of the directors shows that the profits do not allow a dividend on ordinary shares. The cost of coke and other materials has been high, and selling prices of cement have been forced down owing, among other things, to the great over-production on the Continent; but the directors report that the demand during the past six months has been good, and they confidently look for increased profits in the future. The rotary kiln plant at Swanscombe is working well.

An Income from Sea-sand.—Until recently builders and contractors were allowed to help themselves to sand and shingle from Yarmouth beach, but the Corporation, finding how the quantities removed steadily increased, decided to impose a nominal charge of threepence per cartload. Small as the charge is it suffices to return a revenue to the civic coffers of no less than £400 per annum, as was shown at the last meeting of the town council, when the half-yearly estimate for the new rate set down £200 as six months' income from sand and shingle taken from the beach.

A Book on Fire Prevention.—Mr. B. T. Batsford, of High Holborn, W.C., announces that a book entitled "Facts on Fire Prevention," edited by Mr. Edwin O. Sachs, and embodying results of investigations with fire-resisting materials by the Fire Prevention Committee, will be issued towards the end of this month. The book, which forms two volumes of 220 pages each, profusely illustrated from photographs and drawings, deals with floor-construction, partition-construction, ceilings, window and door protection—all subjects of considerable immediate importance, both in respect to the practice of building in London and the various proposed amendments in the Building Act and factory regulations. The volumes contain facts only, as distinct from views and criticisms, and the book is intended as a standard work of reference.

The late Mr. W. B. Wilkinson.—We regret to announce the death of Mr. W. B. Wilkinson, of Newcastle-on-Tyne, on October 13th, in his eighty-fourth year. He was the founder of the well-known firm of W. B. Wilkinson & Co., Ltd., of Newcastle-on-Tyne and London, and was the originator of the now universally known concrete pavings. The first floor ever laid in this form was a greenhouse floor in Newcastle-on-Tyne by this firm, and afterwards the business developed to an enormeus extent, their paving being laid all over the kingdom, and even as far away as Lisbon. Mr. Wilkinson took out a patent in 1854 for fireproof construction. He used wire rope and small bars embedded below the neutral axis of the concrete. In 1856 he patented a hollow tubular fireproof and sound-proof partition, and in the 'eighties an ornamental concrete paving, which he called "Specular Granitic." The deceased gentleman was a J.P. and was chairman of the Newcastle and Gateshead Gas Co., director of the Newcastle and Gateshead Water Co. and the North Shields Gas Co., and was connected with many of the largest businesses of the North of England, while his connection with philanthropic institutions of the district was equally extensive.

Bricks and Mortar.

Aphorism for the Week.

It has been, in all ages, the aim of good architecture not only to add beauty to utility, but, so far as possible, to make it grow out of, and result from, the uses and construction of the various parts of the building.—Sir Gilbert Scott.

Our Plates. The four houses and shops in High Street, Oxford, recently completed, are built of brick faced with fine rough-cast and with dressings and chimney stacks of Milton stone. The roof is covered with Naunton stone slates in diminishing courses. The bay windows facing the street are of oak. The builders are Messrs. Benfield & Loxley, of Oxford, and the architect is Mr. E. P. Warren, of Westminster. The perspective was exhibited at this year's Royal Academy.—The drawing of the Papal Palace at Avignon, by Mr. Percy Wadham, is worthy of study as careful and accurate draughtsmanship in that difficult medium—line. We have in hand two other large drawings by this able draughtsman which will be published shortly. This mediæval palace of the Popes has been in a state of decay for over a century—indeed, ever since it was handed over to the First Republic by the Popes—but is at last to be preserved. It was this palace that Froissart characterised as the most complete stronghold and the most beautiful abode in the world. Its strength was undoubted, and it was one of the finest examples of the military architecture of the fourteenth century; but there were certainly two opinions as to its beauty. Seven popes reigned here between the election of Clement V. and the return of the eleventh Gregory to Rome, and most of them added to the already huge dimensions of this temporary Vatican. Since then it was occupied for a century as a barracks, and its chambers cut up into guard-rooms and dormitories. The soldiers have not been respectful towards the frescoes or the sculptured work ornamenting many parts of the great construction. Among the numerous acts of vandalism committed has been the desecration and, it may be said, the obliteration of the mural paintings in the Chapels of St. John's Tower representing scenes in the Baptist's life, the Crucifixion, and St. Martial. Furthermore, frescoes representing the Last Judgment and Christ on the Cross, are utterly defaced. The citizens of Avignon want to turn the château into a museum of religious art, but this and the building of a new barracks will necessitate a large outlay. Thus great difficulties are in the way, and it may be a long time yet before the Palace of the Popes becomes a rendezvous of intelligent or merely curious visitors from every quarter of the globe. The Emperor Napoleon the Third promised so far back as 1859 to apply 4,000,000f. to the restoration and preservation of the palace as an interesting historic relic, but he was too fully occupied with other schemes and projects to carry out his promises. The castle or palace rises majestically from the banks of the Rhone. John Stuart Mill lived at Avignon for some years.

A Greek Competition. The United States Consul at Patras gives notice in a report of a competition for plans for a church in that city. The decision has been reached to substitute a new building for that dedicated to St. Andrew, which was erected early in the second quarter of the last century, and for this purpose a sum of 2,000,000 drachmæ has been set apart. Assurance is given that contributions from foreign architects who may wish to compete will be welcomed. The general style will be Byzantine. The Consul adds some of the governing conditions, sufficient, he thinks, to enable artists and architects to decide whether they can afford with profit to enter the contest. The general dimensions are left to the discretion of the architect, but the whole structure must come within a ground space of 25,834 sq. ft.; in making the plans attention must be paid to the possible effect of earthquakes, to which the region is subject; and accommodation must be provided for at least 5,000 worshippers, exclusive of standing room, which is to be provided in the women's apartments and other annexes. It is intimated that possible models may be found in the Russian Church of St. Nicodemus at Athens, or in the Church of Sta. Sophia at Constantinople. The competition will be divided into two parts, only those who pass the first degree being entitled to enter the second. For the former certain general conditions are laid down, and the preliminary plans thus submitted will be examined by the committee, of which the Metropolitan Bishop of Patras is the chairman. Those successful in passing this degree will be required to meet some additional requirements. The competitions for the preliminary trial will close on February 13th, 1903, when those who have passed with success into the second degree will be allowed an additional 150 days from the time that decision is made. The final plans will be submitted to some European academy of fine arts. When it has decided upon the merits of the plans, the committee will award a first prize of £400, a second of £160 and a third of £80.

A Hippodrome for Manchester. Mr. Bertie Crewe has prepared the plans for a new building at Manchester to be called the Royal Hippodrome. On either side will be a winter garden, with small stage and orchestra, into which the public will be admitted while waiting for the doors to open, and where they will be entertained with vocal and instrumental music, &c. One of these, the larger, will be set aside for the occupants of stalls, circle and pit, and the other for the gallery. This will serve to keep the crowds off the street. A complete set of entrances and exits will lead direct from these gardens to all parts of the hippodrome. The auditorium will be no less than 105ft. from curtain line to back wall, and 90ft wide, in spite of which there will not be a single column of any description in the line of sight, the entire circles being supported on the cantilevers. The ceiling will be domed and surmounted by a sliding roof worked by electricity from the stage. The latter will have a depth of 42ft. and a width of 90ft., and will be 58ft. to the gridiron floor. Under the stage will be a tank with a superficial area of 600ft., and Mr. Crewe has designed a means whereby the whole stage above this tank can be slid off, so that when water effects are required they can be ready in three minutes. A specially-designed ring will also be used on this stage, so that every class of performance can be exhibited without a large portion of the auditorium floor being taken up. The width of the proscenium opening will be 40ft. The dressing-rooms are in a separate fire-resisting block The building will be opened on August Bank Holiday, 1903.

Llan-Degvan Church. This church has been re-opened after restoration. The walls, which were composed chiefly of local boulder stones, had been originally built with tempered clay which would be the only means at hand in the fourth century, when lime mortar was unknown in Anglesey. The old oak principals of the roof were reduced by decay to a small core in each beam. By dint of careful selection of these cores, the builders, Messrs. R. & J. Williams, of Bangor, have saved enough to enable them to make an altar. The new roof has been most carefully made to appear as nearly as possible like the

old roof. The furniture of the church consists of new oak seats, pulpit, reading desk and chapel screen. The lighting of the church is effected by nine new lamps, hung from the roof beams by chains and links. The outer and inner doors of the porch and the vestry door are of new English oak. The floor has been laid with wood blocks of Canadian maple on a concrete bed. In the chancel have been placed a carved dado of alabaster and a super-altar of the same material. The sanctuary floors are laid with white marble. The old stoup has been fixed in position "tooled" and cleaned. The old font has been mounted and placed outside to the right of the porch. This font was found in 1848 in the garden at Pant Howell, and was afterwards removed to the churchyard. The windows have, with one exception, been renewed, the mullions in all of them being of Cheshire red sandstone. The old monuments have been cleaned and refixed. The architect of the restoration was Mr. P. S. Gregory, of Bangor.

Official Architecture. In the note on the office of Supervising Architect of the United States Treasury Department, the reorganization of which was begun by Mr. Aiken and carried by Mr. John Knox Taylor to a higher level than was thought possible, the "American Architect" says:—"The personnel of the office is of an unusually good type, and the place has acquired the real atmosphere of an architectural studio, to have access to which a young man may now honourably be eager. Ten years ago it would never have occurred to us to recommend an able young man to secure a position in the Supervising Architect's office; it would have been simply to advise his voluntarily seeking to degrade his own talent and set a bar across the path of his professional progress. Happily, things are changed, and we can now not only advise but urge young men of ability, who have not the connection and backing that entitle them to believe they can become successful private practitioners, to seek a position in the Government office."

Aston Hall. Aston Hall, Birmingham, is now nearly 270 years old, and numerous repairs are being carried out under the supervision of Mr. J. A. Cossins, architect. For the past fifteen years the hall has been practically continuously in the hands of the workmen. Minor repairs are constantly being executed, and the work is necessarily of a slow character. The greater portion of the work is out of sight, consisting as it does of strengthening by underpinning, &c., beams and dangerous fireplaces especially having been given attention. Last year the great work which had to be undertaken was the reinstatement of one of the pavilions on the south side. When that was completed one of the small towers was found to be in a dangerous condition. Scaffolding was erected to enable the men to take out certain rotten timbers to replace them with new and with iron girders, to reinstate all the lead-work on the roof, to repoint the whole of the brickwork and also to deal with a great deal of the stonework. This work has just been finished. The workmen are at present engaged in making sound some of the decayed stone parapets and other works as they are discovered. Other parts of the hall to which considerable attention has been devoted is the roof-tiling and many of the lead gutters. Mr. Cossins states that the old foundations of the hall, from end to end, are faulty, and this is responsible for much of the work which is necessary. In a few years the hall will be in a much stronger condition than has been the case for more than a century.

A Leeds Church. Trinity Congregational Church, Leeds, illustrated on this page, is a new building now being completed from the designs of Messrs. Danby & Simpson, architects, of Leeds. The total cost will be about £23,000. The church consists of nave, aisles, transepts, chancel and a tower and a spire rising to 130ft. The main entrance is approached by a flight of stairs leading to an outer vestibule—at what would be the west front were the building oriented in the usual ecclesiastical style; as a matter of fact, it is south-east. Above is a seven-light window, and there is a corresponding window at the chancel end (by Messrs. Atkinson Brothers, of Newcastle-on-Tyne). The pulpit is at the corner of the southern transept, and is of carved oak resting on a pediment of Caen stone, relieved with alabaster pillars. The fittings in the chancel, the choir stalls and the organ-case are also in carved oak; while the pews are of pitch-pine, and accommodate 800 worshippers. There are no galleries. The contracts were in every case let to local firms, the list being as follows:—Masonry, Messrs. C. Myers & Sons; carpentry, Messrs. H. Atkinson & Son; plastering, Mr. J. W. Watson: slating, Messrs. J. Atkinson & Son; plumbing, Messrs. W. Barrand & Co.; painting, Mr. A. Bateman; heating apparatus, Messrs. J. & H. Smith; electric lighting, Mr. Norman Hirst and Mr. A. Dickinson. The illustration on this page has been kindly lent to us by the "Leeds Mercury."

TRINITY CONGREGATIONAL CHURCH, LEEDS. DANBY AND SIMPSON, ARCHITECTS.

New Patents.

These patents are open to opposition until November 24th.

1901.—Excavators.—18,276. J. L. Powell, 16, Clive Place, and S. H. Davey, 104, Plymouth Road; both of Penarth, near Cardiff A number of buckets with cutting edges are arranged on the face of a disc which is rotated by any convenient means. The material is thus excavated and carried round in the bucket to the opposite side, where it falls out into a truck. The device may be used in the heaviest clay, as this cannot become stuck but must fall out when the bucket has passed a certain angle.

Automatic Electric Lifts.—18,577. J. Bush, 90, Lausanne Road, Peckham; and M. T. Medway, 175, Shardeloes Road, Brockley, Kent. By pressing a button on any floor all the other call-buttons are cut out and the lift goes either up or down to the floor in question, and there stops. When the passenger enters the lift his weight again cuts out the call-button, but the lift buttons are put in circuit by the closing of the gate. The passenger then presses the button for the particular floor he wishes to reach, and the lift is operated accordingly.

Combined Lock and Latch.—18,756. E. T. John, "Mayfield," Llanbadarn Road, Aberystwyth. The fastening can be opened by hand when unlocked and by a key when locked, and can also be fastened so that no key can open it, thus forming a locked bolt.

Hot-water Heating Apparatus.—18,930. O. M. Row & Royles, Ltd., 131, Great Bridgewater Street, Manchester. A casing is fitted on the flow pipe (preferably near the calorifier) with a small turbine inside for driving the water forward and thus creating a more rapid and uniform circulation than is afforded by the natural flow. The turbine is driven by a jet of steam from the calorifier steam-pipe, and, after use, is delivered into the calorifier to heat the water.

Lubricating Pug-Mills.—20,584. A. E. Glazebrook, Albion Villas, Colley Lane, Cradley, Staffs. The forming die has a series of fine perforations through which the lubricant—oil, water or steam—is forced. In some cases shields may be used to prevent the perforations becoming clogged with the clay.

1902.—Shallow Drains.—703. W. G. Nicoll, Eastwood, Parkstone, Dorset; F. Swinburne, North Street, Emsworth; and R. G. Carte, Burndale, Emsworth, Hants. The drain is square in section, with a central circular hole in it. It is made of concrete or other suitable material, and when laid its upper surface forms part of the pavement.

Concrete Piles.—7,984. A. E. Williams, Dagenham Dock, Essex. A double-flanged beam of steel or iron extends from end to end of the pile and is moulded around with concrete. It is encircled by transverse metal hoops or bands embedded in the concrete, and the lower pointed end of the pile is formed by cutting away the web and bending the flanges of the beam inwards.

Artificial Asphalt.—10,423. R. Hermes, Guben, Germany. The mixture consists of 11 parts of tar and 2 of resin, heated together, and the addition first of 1 part of sulphur and then of 11 parts of powdered lime.

The following specifications were published on Thursday last, and are open to opposition until December 1st. A summary of the more important of them will be given next week.

1901.—18,764, Fripp & Watt, window fastenings. 18,913, Davidson & Davidson, cutting holes in wood. 19,224, British Thomson-Houston Co., Ltd., & Holden, electricity meters. 20,064, Hunt, self-sustaining gear for lifts, hoists, &c. 20,075, Redman, gas pilot-lights. 20,218, Barnsley, Barnsley & Barnsley, automatic brakes for pulley blocks, hoists, &c. 20,287, Wehinger, machinery for making wood-flooring. 20,325, Thomson, carrying standards of window fittings. 21,921, Maschke, dust collecting and removing apparatus. 22,277, Irwin, tap. 22,626, Garnier, means for securing windows. 22,729, Feeny, portable ramps. 22,788, Hamilton, fixing tiles in grates. 22,946, Cartland, door top hinges. 22,992, Collins & Milne, bolts for doors, windows, &c. 23,630, Krauss, means for thawing frozen pipes. 24,396, Britton, door checks. 24,605, Taylor, hot-water heating apparatus.

1902.—679, Howard, parallel rulers, protractors, &c. 5,096, Hendry, window-sash frames. 5,557, Hamilton, fixing tiles in grates. 12,538, Ott, soldering apparatus for band-saws. 13,881, Bromley, combined fire-escape, household lift, &c. 14,801, Washington, Stanton & Woore, heating and protecting system for pipes, fire-plugs, &c. 14,876, Dietrich, steam-heating systems. 16,500, Frederiksen, locks. 17,012, Angus, impregnating wood. 17,468, Adams, sink supports.

Law Cases.

Defrauding Messrs. Young & Marten: Traveller committed for Trial.—At Stratford recently John Locke (thirty-four), a traveller for Messrs. Young & Marten, Ltd., builders' merchants, of the Broadway, Stratford, E., was charged on remand with obtaining £15 17s. 9d. by false pretences, and with forging and uttering two cheques for £15 17s. 9d. and £10 with intent to cheat and defraud his firm. On August 23rd he was given a cheque for £15 17s. 9d., sent by J. W. Carr, a builder, of Acton, with instructions to hand it back and get another cheque for £3 more in full payment of an account which was in dispute, but, instead, he gave Mr. Carr to understand that he was authorised to accept the £15 17s. 9d. in full payment of the disputed account, and thereupon Mr. Carr marked the cheque "Please pay cash," and the prisoner got cash for it at the bank. In the second case a Mr. H. Roberts, plumber, of Eltham, sent a cheque for £10 to the prisoner in connection with an account with Messrs. Young & Marten, and prisoner, instead of forwarding the cheque to the firm, sent it to his landlord's agent in response to a demand for rent due. In each case the cheque was endorsed "Young & Martin," and Mr. P. B. Wood, the secretary, pointed out that in all his communications to the firm prisoner invariably wrote "Martin" for "Marten." After a long hearing Locke was committed for trial on the three charges.

Alleged Damage by Tube Railways.—At Red Lion Square, Holborn, last week Mr. Under-Sheriff Burchell and a special jury heard the case of *Matthews* v. *the Great Northern and City Railway Co.*, a claim for compensation in respect of structural injury alleged to have been caused to Nos. 110 and 126, New North Road, by subsidence due to the construction of the new "tube" railway from Finsbury Park to the City. The claimant stated that from the end of the year 1900 until recently various structural defects had developed. On behalf of the company counsel contended that the method by which the "tubes" are constructed, by means of the "Greathead shield," precluded the possibility of any movement or subsidence of the soil through which they are driven; and that the houses in question were sixty or seventy years old and rested on very shallow foundations. Mr. E. A. Gruning and Mr. H. Chatfeild Clarke, architects; Mr. Leslie R. Vigors, surveyor, and Mr. Johnston, engineer to Messrs. Pearson, the contractors for the line, were among the witnesses. The jury's verdict was unanimous for the defendant company, that damage had not been done by the construction of the "tube" but that it was the work of time.

Plumbing with Rags and Paper.—At the North London Police Court recently a plumber named Coaker was prosecuted by the Islington Borough Council for having improperly set up soil pipes. Sanitary Inspector Metcalf said that Coaker had run molten metal into the joints of the pipe where it was easily observable, but at the back of the pipe the joints were stuffed with rags and paper. This was in August, and the pipes were still in the same condition. Coaker said he could not deny it, but the fact was he was assaulted by some men on the job, and was unable afterwards to do the work or properly supervise it. A fine of 40s. was imposed, with a penalty of 20s. per day for fourteen days, altogether £16, or a month's imprisonment.

An Architect's Speculation.—On Friday last at the Whitechapel County Court Mr. W. A. Longmore, architect, of Great Alie Street, sued Mr. G. T. C. Goatley, of the United Lay Solicitors' Agency, 93 and 94, Chancery Lane, for the return of £30 advanced under peculiar circumstances. The defendant represented to the plaintiff that the Hackney Safe Deposit Co. was about to be registered as a limited liability company, and that the plaintiff might be its architect if he subscribed a sum of £50 to preliminary expenses. To this the plaintiff agreed, but when he had advanced £30 he grew suspicious, and withdrew from the bargain. The defendant admitted that the Hackney Safe Deposit Co. had not been registered, but did not see why the money should be returned. Judgment for plaintiff with costs.

"Squares" under the L.B.A.: Important Case.—At the Bow Street Police Court on Thursday last Samuel Poldew, builder, Woodstock Road, Uxbridge Road, was summoned by Charles Foster Hayward, district surveyor, for contravening the London Building Act, 1894.—Mr. Hayward said the defendant was erecting a large building at 116, High Holborn, the basement to be used as shops and the four upper floors as flats, each of which would accommodate at least three persons. Section 74, sub-section 2, of the London Building Act, 1894, provided that in every building exceeding ten "squares" (1,000 ft. super.) in area, used in part for the purpose of trade or manufacture and in part as a dwelling-house, the different parts should be separated by walls and floors of fire-resisting materials and have staircases and passages constructed in a similar way. In the building in question there was a staircase about 3ft. wide. It was made of deal, and stood some distance from the shop door; there was an awkward bend, and in case of fire the people in the flats would have a great deal of difficulty in getting out. He had served notices on the defendant, who had tried to evade doing what he would have to do if the building exceeded ten "squares" in area by walling up two vaults. But even then the building came within the Act, as the area was still slightly in excess of the ten "squares." He considered the place a perfect "fire trap." He was continually receiving circulars from the London County Council as to the precautions to be observed against fire.—Mr. Fenwick: If there were no vaults, and the area or the building was slightly less than ten squares, would the danger be as great?—Mr. Hayward: Yes.—Council for the defendant said he was in a position to prove that now the vaults had been walled off, the area of the building was less than ten "squares," or 1,000 ft. super., and therefore did not come within the section of the Act under which these pro-

ceedings were taken. The section was very restrictive, and if a man could erect a building just small enough to evade it he was quite justified in doing so. Counsel then called witnesses to prove that the area of this particular building was less than ten "squares," but they agreed that if a staircase which was to be erected outside was to be included that measurement would be exceeded.—Mr. Hayward contended that the staircase, although outside, would form part of the building, and should be included in the measurement.—Mr. Fenwick said the case was an important one, and he would reserve his decision until this week

Keystones.

At St. Agnes's, Kennington Park, choir stalls have been erected at a cost of about £300 as a memorial to Queen Victoria.

At St. Paul's Church, Wooburn, Bucks, a new bell has been added to the seven ancient bells, which have been rehung in celebration of the Coronation.

St. Peter's Vicarage, Southwark, is shortly to be erected in Sumner Street from plans by Mr. A. H. Ryan-Tenison, A.R.I.B.A., of 12, Little College Street, Westminster, S.W.

A Fire Station at Coventry has been erected at a cost of about £5,000. It occupies an area of about 1,220 sq. ft. on the Pool Meadow, and is two storeys in height, with an ornamental tower rising to a height of some 70ft.

The Young Men's Christian Association Premises in London Road, Lowestoft, are being enlarged by an additional storey. Mr. Herbert J. Greene, A.R.I.B.A., of Norwich, Lowestoft and Lynn, is the architect, and the contractor is Mr. John Ashby, of South Lowestoft. The front of the building will have Costessey moulded dressings.

St. Peter's Boys' School, Southwark.—A new boys' school to serve this parish is to be modelled from the existing grammar-school building, in accordance with the plans sanctioned by the Board of Education and prepared by Mr. A. H. Ryan-Tenison, A.R.I.B.A., of 12, Little College Street, Westminster, S.W.

Hartshorne Parish Church is being restored. The scheme includes the restoration of the chancel and enlargement of the church by building a new aisle and vestries, and the restoration of the nave and tower, at a total estimated expenditure of £2,711. The plans for the restoration have been prepared by Mr. G. F. Bodley, R.A. Messrs. Ford & Co., of Derby, are the contractors.

A Wesleyan Church and School at Kington has been erected at a cost of about £2,200. The style is Gothic, and the materials are pressed brick with Bath-stone dressings. The woodwork is of pitch-pine, with the exception of the rostrum, which is of polished American walnut. The church seats 200. The schoolroom, built at right angles to the church, accommodates 300 children. The architects were Messrs. W. T. Morley & Son, of Bradford, and the contractors Messrs. Bowers & Sons, of Hereford.

The Arts and Crafts Exhibition Society have been awarded special honours at the Turin International Exhibition of Decorative Art. By unanimous vote of the international jury a special diploma of honour was given to the Society. Their next exhibition of decorative design and handicraft in London will be held at the New Gallery and will open in the middle of January. Owing to the limits of space the works shown will be those of artists and craftsmen of the United Kingdom. The receiving days will be the last three days of December.

Municipal Buildings at Jarrow are being erected at an estimated cost of about £9,000, in Grange Road. The elevations are in Renaissance style. Mr. Fred Rennoldson, of South Shields, is the architect, and Mr. James C. Nichol, of South Shields, the contractor.

At Newtown Parish Church a stained-glass window has been erected as a memorial of Queen Victoria, at a cost of £400, from designs by Mr. R. Creed, architect, of Finsbury Circus, London. The execution of the work was entrusted to Messrs. James Powell & Sons, Whitefriars, E.C.

At St. Jude's School, Southwark, extensive alterations and additions are to be carried out in accordance with plans sanctioned by the Board of Education and prepared by Mr. A. H. Ryan-Tenison, A.R.I.B.A., of 12, Little College Street, Westminster. The tender of Messrs. Parsons & Co, of Wandsworth, standing at £2,200, has been accepted subject to the work being executed in sections.

Preservation of Derwentwater.—Princess Louise, vice-president of the National Trust for Places of Historic Interest or Natural Beauty, last week opened the Brandelhow estate on Derwentwater, which the Trust has acquired for the use and enjoyment of the public in perpetuity at a cost of about £7,000. The property comprises 108 acres of picturesquely-wooded and common land on the shore of the lake.

Truro Cathedral.—At the last meeting of the General Committee of Truro Cathedral the financial report was presented, and showed that after allowing for expenses there would be a surplus of over £1,800. The architect and contractors, it was also stated, were perfectly satisfied with the progress and condition of the building, and saw no necessity for the removal of the fractured bases of the nave. The building operations will in all probability be completed by May 1st next.

The Ruskin Memorial.—Lord Avebury laid the foundation-stone of the first portion of the Ruskin memorial building at Bournville yesterday. Alderman George Baker, who succeeded Mr. Ruskin as Master of the Guild of St. George, presided. The building will embrace library, lecture-room and rooms for the study of handicrafts, &c., and will enable the committee to carry out at an early date a practical experiment on the lines of Mr. Ruskin's teaching.

"Academy Architecture" for 1902 (vol. 21) forms, as usual, a most interesting collection of architectural drawings hung at the Royal Academy Exhibition, the Royal Scottish Academy, and the Royal Glasgow Institute of the Fine Arts, as well as sculptures, and numerous designs by English and Continental architects. A colour plate is given of the Board Room in Electra House, Finsbury Pavement (Mr. John Belcher, A.R.A., architect); of the interior of a church by Mr. G. H. Fellowes Prynne, F.R.I.B.A., at Lower Sydenham; and of a house at Littlestone-on-Sea, by Mr. John Cash, F.R.I.B.A. "Academy Architecture" is published at 58, Theobald's Road, W.C., price 4s. 10s. nett.

The Ruins of Tintern Abbey came into possession of the Crown recently on the disposal of the Beaufort estates in Monmouthshire, and the Department of Woods and Forests is engaged in works of preservation and restoration. Mr. Waller, of Gloucester, one of the Crown architects, has the supervision of the work, and an endeavour is being made to restore old material to its original position where possible. In connection with this object extensive excavations have been made, and portions of the ruins which have long remained hidden beneath several feet of soil have been disclosed, notably the lay brothers' quarters and the ancient watercourse made by the builders of the Abbey.

The new Fever Pavilion at the Swindon Hospital, Gorse Hill, is to be opened to-day. Mr. A. J. Colborne, Newport Street, Swindon, was the contractor.

At St. Wilfrid's Catholic Church, Hull, a stained-glass window has been erected. The work was executed by Mr. Norman Reed, of Newcastle-on-Tyne.

A Public Library at Falkirk has been opened by Mr. Andrew Carnegie. Messrs. M'Arthy & Watson, of Frederick Street, Edinburgh, were the architects. It is two storeys in height. The cost has been £6,000.

Mr. H. Syer Cuming, a vice-president of the British Archæological Association, died recently in his eighty-sixth year. His museum of interesting and valuable natural and artificial rarities, of which his father, the late Mr. Richard Cuming laid the foundation so far back as 1782, has been bequeathed to the Newington Public Library, Walworth Road.

The Pretoria Cathedral.—Despairing of being able to erect a sufficiently large section of the proposed new cathedral in Pretoria, the bishop of the diocese has been compelled to enlarge the present temporary structure, and the work of throwing out the aisle is now in hand. It will cost £650, and provide 200 additional sittings, making a total of 620. The bare shell of the new cathedral will cost £20,000, of which only £2,000 is subscribed.

Manchester Infirmary Site: The Matter Settled.—At a special general meeting of the trustees of the Manchester Royal Infirmary, held on Thursday last, a resolution was passed confirming the policy that there shall be no rebuilding of the infirmary on the Piccadilly site; that that building and site be disposed of on terms to be approved by the trustees and sanctioned by the Charity Commissioners; and that a new infirmary, on plans to be approved by the trustees, be built at Stanley Grove without delay unless a better site can be obtained.

A Municipal Art Gallery Wanted.—Six deputations have asked the Hampstead Council to facilitate the provision of a Municipal Art Gallery and Museum for the borough. The speakers included Sir Samuel Wilks, Mr. Storey, A.R.A., and others representing the local art, scientific, antiquarian and medical societies. The council was asked to sanction the erection of the art gallery and museum by public subscription on a site, belonging to the borough, adjoining the Central Public Library, Finchley Road, and thereafter to maintain the building out of the penny library rate.

A new County School at Wrexham has been erected at a cost of about £10,000. It accommodates 140 boys and 125 girls, and is arranged in two sections, with a large assembly hall occupying the central position, common to both. The staircases are of granolithic concrete, constructed by Messrs. Ward & Co., of London. The floors generally are of wood blocks, laid by Messrs. Ward & Co. The heating is by open fire-places and hot-water pipes, which are carried throughout the building. Messrs. Lander's grates are used, and the hot-water heating has been carried out by Messrs. Dargue, Griffiths & Co., Liverpool. The whole of the building is of bricks, faced with Messrs. J. C. Edwards & Sons' Ruabon best-pressed bricks, and the stone used in moulded and plain work is from the Cefn Quarries. The roof is of slate. Mr. W. E. Samuels, of Wrexham, was the contractor. The architect was Mr. John H. Phillips, M.S.A., of Cardiff, whose designs were selected in open competition.

Tenders.

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, *Effingham House, Arundel Street, Strand, W.C.*

(Oil or Pneumatic Check Action).

FANLIGHT OPENERS. New Patterns.

PANIC-EGRESS BOLTS. Approved by the L.C.C

Engineering Notes.

The Technical Schools, Kingston-on-Thames, have been supplied by Messrs. E. H. Shorland & Brother, of Manchester, with their patent Manchester grates.

Mr. Peter Brotherhood, the mechanical engineer who, by the invention of a new type of steam-engine, and afterwards of a special high-pressure air-compressing pump, greatly assisted in the development of the automobile torpedo died last week in his sixty-fifth year.

The "Mechanical World" Pocket Diary and Year-Book for 1903.—The sixteenth annual edition of this handy little book has just been published. The section on electrical transmission of power has been amplified and many new tables added. The book contains much that will be of considerable use to the architect, although it more especially appeals to the engineer. It is published by Messrs. Emmott & Co., Ltd., New Bridge Street, Manchester, price 6d. nett.

Surveying & Sanitation.

Australian Wood Paving.—The Government of New South Wales has forwarded a supply of hardwood from the Colony to be laid down in one of the busiest thoroughfares in Westminster in juxtaposition to blocks of other kinds of street-paving woods. The intention is to obtain a practical test of the durability of the New South Wales wood when used in the streets of London.

Mr. James Frederick Field, of the firm of Field & Sons, auctioneers and surveyors, of 54, Borough High Street and 52, Chancery Lane, E.C., died last week at the age of fifty-eight years. He was elected president of the Auctioneers' Institute in 1896, and was unanimously chosen to fill the office for a second year. Mr. Field, who was a Fellow of the Surveyors' Institution, was the only surveyor who gave evidence in favour of "betterment" before the Parliamentary Committee. He was one of the valuers under the London County Council and a surveyor to the Board of Trade, and was frequently employed as an expert witness or arbitrator.

Coming Events.

Wednesday, Oct. 22.

An Architectural Causerie.

Discoveries about the Campanile. The ruins of the Campanile at Venice have been removed by barges, and the piazza in front of the basilica is completely disencumbered of rubbish. The technical commission nominated to enquire into the cause of the catastrophe has already succeeded in making some curious discoveries. On the ground floor in the caretaker's lodge an economical kitchen—*cucina economica*—(probably a hot-plate or a gas-stove) had been installed in the thickness of the wall; in the centre of the tower the brickwork had been cut away to form cupboards, a recess, and, lastly, a small aquarium. Another face of the tower had been cut into as far as the middle of the thickness of the wall to increase the size of the caretaker's lodge, and in the wall thus reduced in thickness openings had been formed for ventilation. In other words, the commission has been able to verify with its own eyes the prophetic words of the architect Commendatore Giacomo Boni: "The Campanile is in the condition of a man who has had both his legs amputated." It results from these discoveries that the stability of the foundations of the tower is considered to be placed beyond question, and one of the most specious objections to the rebuilding of the Campanile, the palladium of Venice—the alleged insecurity of the foundations—is thus removed. It is a curious coincidence that the present secretary of the municipality of Venice, the Commendatore M. Memmo, who is believed to be the last of his race, is a descendant of the Doge Memmo, in whose reign the foundations of the Campanile are said to have been laid in the year 888.

A Florentine Sketch. The sketch on this page, by Mr. Herbert Raine, is taken from the inner hall on the ground floor of the Palazzo Vecchio at Florence. As one enters this hall there are two low, broad, soffited, semi-arches, one on either side, butting against enormous piers and springing from masonry which projects within the arches in the shape of pedestals, two to each arch. On these pedestals there are four seated lions, and between each couple is a small wall fountain. The architectural effect of the whole is most dignified and unique, and shows a most effective way of dealing with the angular portions of an arch where the headroom is limited.

Erebus, Erebus. On the dismal slope that leads down to the Tunnel of Penance two spirits conversed—one was Heine, the other Swift. Moans and groans proceeded out of the mouth of the Tunnel, terrifying to any human ear, but almost tuneful to the fearful genius of the Dean. As they drew nearer they saw a long line of tormented forms climbing the steep ascent that lay to the left of the Tunnel.

PALAZZO VECCHIO, FLORENCE: A SKETCH IN THE INNER HALL, BY HERBERT RAINE.

"See, see," cried Swift, "these are they which planned and built on earth—but badly. Let us watch them." As each poor soul reached that black entrance a loud voice cried out his name, and thereupon a devil, who sat before a great book, turned over the grimy leaves till on the page he saw all that the man had planned or built. So was he consigned to his fate in that Tunnel of twenty stages, and, exactly as his deserts were, was taken to his appointed place. The worst stood trembling at the first stage and passed moaning through the remainder till, at the last, they worked out their end and emerged into the light that shot in narrow shafts through the opposite end of the Tunnel. "What wretch is he?" cried Heine to a swarthy devil who tended a pot of boiling pitch. "Ha! ha! here is an architect who made much money, but spoiled the land with hideous houses. He was fond of a 'free treatment.' Now he is rather more restrained in feeling, and the string-courses of his life are built in blocks of pitch. He has a friend over there, ha! ha! who used to design hotels. Now you see him always adding room to room, but still a voice cries in his ear 'More, more,' and so, in feverish haste, he goes on with his never-ending plan. Come, I will show you others. There are many kinds and conditions of them. That hollow-eyed man whom you see sprawling on the floor is doomed to work with a bent square and a curved ruler, for it was he who began 'L'Art Nouveau' and made his brain a wilderness. Aye, there are young souls about, assistants forsooth who looked on travellers as if they were dogs; and builders, too, who evaded by-laws. That man, you see him to the right, walks on a place which is always wet with the sniffings of those who took cold in his houses—he omitted his damp-courses, and now he is condemned to pace that slimy path." "That is a strage man, and a strange fancy of his," said Swift, pointing to a form that eyed some object through a glass. "Yes," replied his informant, "he is one of those whose houses were so mean that he is required to look at them through a telescope. They make him writhe, but his fate is for the present to remain glued to that eye-piece. Let us pass. Aye, it is quieter here, for we come towards the end, where the pains are light and the troubles less intense. I am too busy to tell you more: you must guess what all these men are paying penance for: I leave you, for the light is too strong here—it hurts my eyes—and there is much for me to do with pitch and pot." Speaking thus, he went back into the gradual gloom, while Heine and Swift passed onwards to the brightening light where the New Men were.

THE CHAMBER OF DEPUTIES, PARIS. GUY DE GISORS, ARCHITECT.

THE CHAMBER OF DEPUTIES, PARIS.

THE Chamber of Deputies, otherwise called the Palais-Bourbon at Paris, is at present undergoing a process of cleaning and reparation during the recess. The paintings and a portion of the furniture are being renewed, as well as the worn-out carpets, the ceilings which threatened to fall, the desks hacked by the penknives of the Deputies, and the green baize tables of the committee-rooms stained with ink and burned by cigars.

On the left bank of the Seine, between the Invalides and the Rue du Bac, there stood in 1721 the hôtels du Maine, de Torcy, de Seignelay, and at the end of the Rue de Bourgogne the Hôtel d'Humières, which last was destined to become in later times the Chamber of Deputies. The Hotel d'Humières was scarcely finished when it became the property of the Duchess de Bourbon, daughter of Louis XIV. and Madame de Montespan. The duchess quitted the ancestral residence of the Condé family near Luxembourg for the banks of the Seine, in the midst of an agreeable landscape, opposite a bridge proposed to be built, which the city owes to the munificence of a former mayor, the Pont de la Concorde, which, begun in 1789 by the architect, Jean Rodolphe Perronet (1708 94), was not completed until 1790. At the same time that the Hôtel d'Humières, transformed, improved and enlarged by considerable additions, took the name of the Palais-Bourbon, there sprang up at its side the Hôtel de Lassay or de Brancas, now the residence of the President of the Chamber. Count de Lassai was the lover of the Duchess de Bourbon, whose portrait is painted by Saint-Simon in his memoirs in a manner not easily forgotten. He died in 1745, two years after the duchess. After his death his hotel was inhabited by Louis Joseph de Bourbon, Prince de Condé, who subsequently became commander of the regiment of emigrants.

At the revolution these princely dwellings were declared to be the property of the nation, and the Palais "ci-devant Bourbon" became Maison de la Revolution, and by a decree of the year III. of the Republic was assigned to the Council of Five Hundred, a portion being given over to the Central School of Public Works, afterwards the polytechnic. The architect, Guy de Gisors (1762–1835), the grandfather of M. Scellier de Gisors, architect to the Senate, pulled down the palais and built on the site the present Chamber of Deputies, which the Five Hundred took possession of in 1798.

In 1814 at the first restoration of the Bourbons the hotel was restored to the Prince de Condé by Louis XVIII., and the prince resided there until 1818, when he died and was succeeded by his son, the father of the Duke d'Enghien, who died under tragical circumstances at the Château Saint-Leu on August 27th, 1830. Madame de Feuchères lived in the pavilion to the right of the president's lodging. This pavilion has since served at one time as a residence for a questor, at another as a residence for the chief of the staff of the President of the Chamber. It was for some time during the revolution of 1830 inhabited by General Cavaignac.

After the restoration the goverment paid the Condé family a rent of £3,000 a year, and in 1827 purchased the freehold of the portion of which they were tenants for £210,000, and in 1843 acquired the premises fronting on the Quai des Invalides for a further sum of £201,979. On the site of these buildings the Foreign Office was built.

The hall of the Five Hundred becoming dilapidated, the architect Jean de Jolly (1762–1835) was instructed to rebuild it and to provide a temporary building during the rebuilding. This was done; a temporary chamber was constructed in one of the internal courts which became the theatre of some important events, and here Loui Philippe was proclaimed King of the French on August 9th, 1830.

The present chamber, which was completed in 1832, is ornamented with twenty four columns of Cararra marble, and contains works by Delacroix, Pujol, Horace Vernet, Pradier and Rude.

In 1846 the Hôtel de Lassay was enlarged and the gallery constructed between the residence of the President and the Chamber of Deputies. The total cost of the buildings up to the present time is stated to be not less than 60 millions of francs (£2,400,000). By a return made in 1852 the figures were £1,575,119, but that amount has been considerably increased since that date.

NEW BUILDINGS AT OXFORD.

IN the BUILDERS' JOURNAL for November 13th, 1901, some particulars were given of the restoration of the colleges and other works at Oxford. These may now be supplemented by the following extracts from the "Oxford Chronicle," whose annual custom it is to notice the various improvements which have taken place in Oxford during the previous twelve months, or which are in progress.

The University.

The scheme of rebuilding the hall attached to University College has been carried out. In 1895 to 1897 a block of buildings in connection with the hall was erected in Logic Lane, designed in a somewhat domestic style, and built in brick, rough-cast and timber. This block has been extended in the same style so as to connect it with the front block in High Street. This front is built of stone and is of simple design, in harmony with the usual collegiate style. The new portion of the buildings provides fifteen sets of rooms, besides porters' rooms, servants'

quarters, bathrooms and offices with every modern improvement. The rooms are large, several of the sitting-rooms measuring 18ft. by 14ft. and the bedrooms 11ft. by 14ft. They are lighted throughout with electricity, and the staircases and corridors with gas. The architect is Mr. H. W. Moore, and the contractor Mr. Samuel Hutchins, both of Oxford. It was originally proposed to connect the college and the new buildings by means of a subway, but the city claiming the ownership of the subsoil, the college refused to acknowledge this right. As a way out of the difficulty the college suggested a bridge across the intervening space.

The new Buildings being erected by Hertford College

at the corner of New College Street and Catherine Street are about half completed. The foundations were put in by the college, and the remainder of the work is being carried out by Messrs Benfield & Loxley. The building is of stone and is of the usual collegiate character, the roof rising to a height of 50ft. The whole makes provision for twenty-four sets of rooms. It is satisfactory to notice that the college intends to preserve that historic structure known as the Octagon House. This curious building, which stood outside the wicket-gate in the city wall, was a house of charity, in which poor scholars or others arriving at the confines of the city after the gates were closed found shelter. Its true form has been shown by the destruction of the old building which had been built against it, and this has also revealed some handsome carving and gargoyles. It is understood to be the intention of the authorities to restore this remarkable building as nearly as possible to its original form, and it is possible that it may serve as a gateway to the quadrangle, which will be formed should the new buildings be extended at some future date. The new buildings are expected to be ready for occupation at Michaelmas term next year. The architect is Mr. T. G. Jackson, R.A.

The Daubeny Laboratory

in the Botanical Gardens has been extended by the addition of a wing. The original buildings were occupied by Dr. Daubeny, and are now the property of Magdalen College, being fitted up as a botanical library and chemical laboratory for the use of Magdalen students. The old room will probably be turned into a lecture-room and museum, while the lower room in the new building will be reserved principally for research work, and the upper rooms for practical inorganic chemistry. Messrs. Benfield & Loxley are the contractors.

The Eye Hospital.

The new wing of the Oxford Eye Hospital was opened yesterday by the Countess of Jersey. The enlargement has not consisted of the erection of an entirely new wing, but of an addition of an upper storey to the existing east wing. This portion of the building is now as large as its companion west wing. Much expense has been incurred in the enlargement—not merely in the actual building operations but in the furnishing of the new apartments with all the improved appliances which have recently been produced. The new wing comprises a main ward, capable of accommodating fourteen patients, an operating theatre, nurses' apartments, anterooms and lavatories. As a means of approach to this upper storey, an upper corridor has been added to the existing central corridor.

During the past year many street and other improvements have been carried out by the Corporation under the direction of the city engineer.

Other new Buildings.

Mr. Frank Cooper, of "Oxford" marmalade fame, finding his already extensive business so much on the increase, is building a new factory. The building, which is being erected by Messrs. Kingerlee & Sons, under the supervision of Mr. H. Quinton, architect, of Oxford, is situated near the Great Western Station and opposite the North-western. The front elevation is in Bath stone and red rubber bricks.

At the Nazareth House, Cowley Road, important additions have been made, consisting of new schoolrooms and dormitory wing. The buildings are upwards of 100ft. in length and four storeys high, and the material used is local red facing bricks and freestone dressings. Mr. E. Goldie, of Kensington, was the architect, and Mr. J. Wooldridge, of Oxford, the contractor for the whole work.

The large new telescope for the Radcliffe Observatory has been erected during the year in the tower built specially for its reception. The lifting floor erected in the tower is almost unique in England as a convenience for the use of a large telescope.

To the Boys' Higher Grade School in Cowley Road a spacious classroom has been added, and in consequence the other rooms have been more conveniently arranged and the accommodation of the school substantially increased. Mr. David Fisher, of Magdalen Street, carried out the work.

A new schoolroom and dormitory have been added to the convent in Woodstock Road, the contractor being Mr. Wyatt, of St. Giles.

It is proposed to erect shops at the north-east corner of Carfax from designs of Messrs. Davy & Salter, F.R.I.B.A.

THE CHAMBER OF DEPUTIES, PARIS.

VERANDAH, "MOOR CRAG," WINDERMERE. C. F. A. VOYSEY, ARCHITECT.

Bricks and Mortar.

Aphorism for the Week.

Gates of monarchs
Are arch'd so high, that giants may get through.—SHAKESPEARE.

Our Plates. "MOOR CRAG," Windermere, for Mr. J. W. Buckley, is built of local stone, cement rough-cast outside, with door and window dressings and paving in green Westmoreland stone, the roofs being covered with green Westmoreland slates with lead hips and ridges. All the interior joinery is in oak and every room is oak-lined to a height of 6ft. 6in., with plain white plaster above. The contractor was Mr. G. H. Pattinson, of Windermere, and the architect Mr. C. F. A. Voysey, of 23, York Place, Baker Street, W.—St. Bartholomew's Hospital, London, is the most ancient in England, having originated in a priory of the same name founded in 1100 by Rahere, a minstrel of King Henry the Second's court. It was repaired and enlarged when Dick Whittington was Lord Mayor of London, and founded anew, at the dissolution of the religious houses, by Henry the Eighth, 1547. The gateway towards Smithfield, the subject of Mr. Ernest G. Theakston's measured drawings, was built in 1702. Some further particulars will be found on the centre-plate. The great quadrangle of the present hospital was built in 1730-33, after the designs of James Gibbs.

Turning Granite Columns. ARCHITECTS will be interested to learn the limit of size to which it is practicable to turn and polish granite columns in America. In the new Episcopal Cathedral in New York provision is made for eight columns, the shafts of which, of polished granite, are 54ft. long and 6ft. in diameter. "There seems to be no difficulty in getting these shafts as monoliths out of the quarry," says the "American Architect," "but in order to polish them they must be put in a lathe; and after several years' trial the contractor, Mr. John Pierce, has come to the conclusion that it is impracticable with any machinery now in use to support the columns in such a way that they will not break, from their own weight, while being turned. The turning itself presents no great difficulty, as lathes capable of turning a cannon 60ft. long have been for many years in use; but a cannon needs little or no support in the middle while being turned, whereas a granite cylinder 9 diameters long, supported only at the ends, cannot be depended upon to sustain its own weight. If it were possible to rest the middle portion on a support of some kind, the strain would be greatly diminished, but, in the nature of things, it is impracticable to give a stone, which is comparatively rough when put into the lathe, a firm support of this sort. The trustees of the cathedral on being informed of the circumstances have authorised the making of these shafts in two pieces, one 36ft. long and the other 18ft. Only three of the columns are as yet ordered, the intention being to erect them by subscription as memorials of distinguished persons. They cost about 16,000 dols. (£3,200) each, so that they do not form a very expensive monument, and it would be difficult to devise a more effective one for the money."

A Criticism of the New Glass at Westminster. MR. LEWIS F. DAY, writing in the "Manchester Guardian" upon the subject of the new windows just erected in Westminster Abbey at the end of the south transept, says: "Messrs. Burleson & Grylls had not much difficulty in improving upon the gaudy glass erected here in 1847 by Ward & Nixon, and removed to make way for the new windows. The new work stands quite on another and a higher plane of technical and decorative excellence. Messrs. Burleson & Grylls learnt their trade years ago in the studio of Messrs Clayton & Bell, and they have not forgotten it. They have a full knowledge of glass and of its technique, and they are capable figure-draughtsmen. And yet the work is not to be pronounced a success. It may not be their fault at all. The vergers tell you, upon enquiry, that it was designed by Mr. G. F. Bodley, R.A. That, of course, is a polite fiction. No busy and successful architect, even if he were master of the *technique* of glass-painting and of figure-draughtsmanship, could possibly find time in the intervals of his professional practice to design work on a scale of this magnitude. But he would presumably prescribe the lines the design should take. And it is here that he is at fault. . . . They (the architect and the glass-painters) have given us mock-Perpendicular glass in Early English architecture—a gay window in a sombre building. And the early window-openings did not lend themselves to this late Gothic treatment. The lower lights are too squat in shape to allow space for canopy work, and the figures are consequently stunted in proportion, at the same time that their niches seem (to eyes accustomed to old glass) too wide for them. And when it comes to the design of the rose window, the radiating figures stand, perforce, some with their feet, some with their heads towards the hub of the great wheel, with most unfortunate results when the change from one to the other of these undignified positions takes place. . . ."

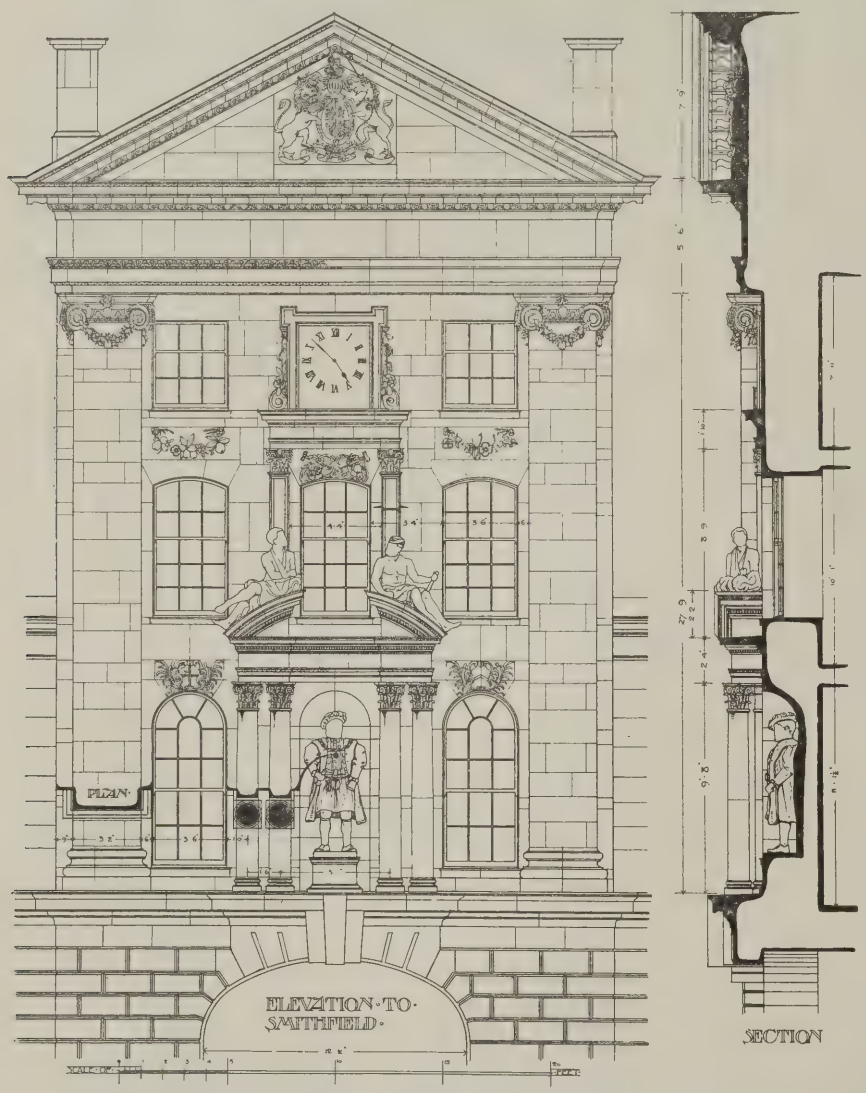
Damp Walls. EVERY day, remarks a writer in "L'Industrie," one has to deal with newly-built walls which cannot be papered. In fact, the surface of new walls requires a considerable length of time in order to dry. During this period the atmospheric carbonic acid transforms the hydrate of lime into carbonate of lime by elimination of the water. The consequence of this slow method of drying is great loss of time, caused by having to wait before papering the walls. However, numerous endeavours have been made to remedy the question, but in most cases without result. The writer of the article himself made many experiments, and finally succeeded not only in drying newly-built walls but also humid surfaces by coating them with a waterproof solution imperceptible to the eye, which makes it possible immediately to paint or paper the walls This wash is prepared as follows:—Dissolve 5lbs. of pure olein in 5lbs. of benzine, and coat the damp surfaces with the mixture. This solution of oleic acid, owing to its great fluidity and the capillarity of the mortar, sinks deeply into the latter, and together with the hydrated lime in the mortar produces a formation of greasy lime which constitutes a waterproof coat. The proportions of the mixture can, of course, be modified according to circumstances; and, instead of benzine, other solvents of the nature of ether and benzol may be utilised. A variation of this method is the employment of other fatty or resinous acids instead of olein. The resinous acids form with the lime hydrate a resinate of lime which has the same waterproof properties as fat lime. Damp or newly-built walls thus coated may, after almost instantaneous evaporation of the liquid, be papered or painted. As in the case of walls in cellars or tunnels, this process can be also employed successfully to coat cement, terrazzo or mosaic work.

Prince Christian Victor Memorial. AT a meeting held last week of the Royal Albert Institute Committee for the erection of a statue to the memory of Major Prince Christian Victor, King's Royal Rifles, to be placed near the foot of the Hundred Steps leading to Windsor Castle from Thames Street, a model was submitted by Mr. Goscombe John, A.R.A., the sculptor chosen to carry out the work on the death of Mr. Onslow Ford. A model was also submitted by Mr. A. Y. Nutt, M.V.O., architect at Windsor Castle, of the sculptured niche in which the statue is to be placed. The whole cost is being defrayed by private subscriptions. The design has been approved by the Committee. The statue, which will be of bronze, will represent the Prince standing bareheaded, with one foot on a boulder

and both hands resting on the hilt of his sword. Below will be an inscription, and there will be shields right and left, bearing the Prince's coat-of-arms on one side and the badge of his regiment on the other.

A Visit to St. Saviour's, Southwark. The Surrey Archæological Society recently visited St. Saviour's, Southwark, which is considered to be the finest mediæval building in London after Westminster Abbey. Fifteen years have passed since the Society last visited the church, and in the interval the building was most happily restored under the direction of the late Sir Arthur Blomfield, A.R.A. Mr. Philip M. Johnston read a paper describing the building. Beginning with an account, as far as it could be ascertained, of the original church, when it was part of the conventual buildings of the Priory of St. Mary Overie, Mr. Johnston pointed out the still remaining traces of Norman work. The old stone roof of the nave fell in 1469, and was replaced by an oak roof, which gradually fell into decay with the rest of the nave, until, in 1838, the whole was taken down and a nave of the meanest description substituted. This remained until the more adequate and nobler-looking building which has now taken its place was erected. Mr. Johnston referred to the good work done by Gwilt in the early years of the nineteenth century, a time when much of the most deplorable work in our churches was being carried out. It was chiefly to his good offices that the beautiful Lady Chapel, as it is now called, or the retro-choir, had been preserved to us. Mr. Johnston proceeded to point out the leading features of architectural value, and explained what had been done by the late Sir Arthur Blomfield, and how far it carried out the original design of the church. After inspecting the many objects of interest in the church, including the old tombs and the modern stained-glass windows in the nave, which commemorated the most famous of the literary and dramatic geniuses who had been associated with the church and parish, the party reassembled in the Lady Chapel, where Prof. John W. Hales, M.A., F.S.A., of King's College, London, delivered a discourse on Shakespeare's connection with the Bankside, and on the early theatres there.

Mr. Kipling at South Kensington. Probably few people know that a portrait of Mr. Lockwood Kipling, Mr. Rudyard Kipling's father, forms a portion of the exterior decoration of the Victoria and Albert Museum. The fact is that Mr. Kipling did a great deal of decorative work for the then new buildings before he went to India, being associated with Messrs. Townroe, Gamble and others under that able pupil of Alfred Stevens, Godfrey Sykes. The north side of the quadrangle of the museum has a series of panels filled with mosaics representing various politicians, officials and artists associated with the institution going in processions, each personally conducted by a classical lady, to receive the (allegorical) reward of their services. That of Mr. Kipling is in the third panel from the west, and he is on the left of the third group. The completion of the east side of the quadrangle has enabled the final panel of this series to be put in place. It is understood to contain portraits of the later directors of the museum and of representatives of the Science and Art Department and the Board of Education.



Siamese Art. The art of Siam is little known in this country, though it has given rise to a good deal of speculation among collectors. The porcelain, for instance, has been a subject of much discussion. As a matter of fact, it is not Siamese at all, but Chinese, models of old Siamese origin and decoration having been sent to that country to be copied, and it is the ware so produced that has caused the puzzle. Similarly, metal-work is made in India for the Siamese market from designs furnished in the same way. In the new Royal Museum in Bangkok some of these pattern-

"MOOR CRAG," WINDERMERE. C. F. A. VOYSEY, ARCHITECT.

pieces are now preserved. The only handicrafts flourishing at the present time of purely native origin are basket-work and mother-of-pearl inlay, of which some magnificent specimens are still to be obtained. The temples, however, contain a good deal of native mural painting of considerable interest. They are generally in a state of ruin, but will probably not be allowed to deteriorate much further, as the King has now apportioned an annual sum of money to keep them in repair. Siam, too, is going in for a system of art instruction. At one time or another young members of the aristocracy have been sent to this country to be educated in this subject among others. Mr. W. H. Lord, an old South Kensington student, is now in Bangkok for the purpose of organising the work; and as he also has the direction of the Royal Museum, such native handicrafts as still remain will probably be better looked after in future.

A Greek Temple larger than the Parthenon.—In the course of the excavations he has carried out on the site of the famous Temple of Hera, Samos, the Inspector of Antiquities at Athens found twenty columns and an altar almost untouched. The temple was a colossal one, larger than the Parthenon, but it has been several times stripped of its ornamentation. The excavations are being carried to a depth of 5 mètres, and will be continued for some time under the direction of the Society of Hellenic Archæology.

THE SOCIETY OF ARCHITECTS.

ANNUAL REPORT.

THE annual general meeting of the Society of Architects was held on Thursday last at St. James's Hall, Piccadilly, W., the chair being taken by Mr. G. Gard Pye, vice-president.

The eighteenth annual report of the Council for the session 1901-02 was adopted.

Among the matters on which the Council has taken action are the following:—

Board of Examiners for Science, S.K.—It having been represented to the Council that amongst the Board of Examiners in Science there appeared to be no architect to deal with "Building Construction," though the papers on this subject appeared to relate rather to architectural than engineering construction, the Council took the matter up and received an intimation that the question would be considered.

County Surveyors and Private Practice.—The Council having had before it the question of county surveyors and private practice, the matter was discussed and the following resolution unanimously passed: "That this Society is of opinion that it would be in the best interests of the public if architects, surveyors and engineers holding official appointments were debarred from private practice."

Ancient Lights.—The Council has noted with satisfaction the formation of a Joint Committee of the R.I.B.A. and the Surveyors' Institution to take into consideration the present state of the law with regard to ancient lights, and has intimated to the Joint Committee its willingness to afford them any information or assistance in its power. The matter is engaging the attention of the Council.

Proposed College of Science, Dublin.—A special meeting of the Council was called in June at which it was unanimously resolved "That the sympathy of this Council be tendered to the Royal Institute of the Architects of Ireland in the attitude they have taken on the subject of the proposed selection of an architect by His Majesty's Treasury for the erection of a College of Science in Dublin, and it is the opinion of the Council that for an Irish work of this national character an Irish architect should be solely employed."

Provincial Branches of the Society.—It has not been deemed advisable to take immediate steps to form branches of the Society in the provinces, as has been suggested, but the Council has under consideration the formation of students' sections in various centres with the object of affiliating the younger members of the profession with the Society and as a means of organising the entrance examinations in the provinces.

Examinations to qualify for Membership.—The half-yearly examinations continue to attract many enquiries and an increasing number of candidates. This is largely due to the policy of the Council in extending the examinations into the provinces. A centre has been formed and examinations held in Manchester as well as in London. The Council has appointed as examiners in Section I., Subject *a*, Messrs. R. F. Vallance, F.R.I.B.A., and S. Wyborn, in the places of Messrs. W. A. Bassett-Smith and J. W. Manning, resigned, the vacancy caused by the resignation of Mr. C. E. Gritton, examiner in Section IV., not yet being filled. The syllabus has been revised and materially strengthened.

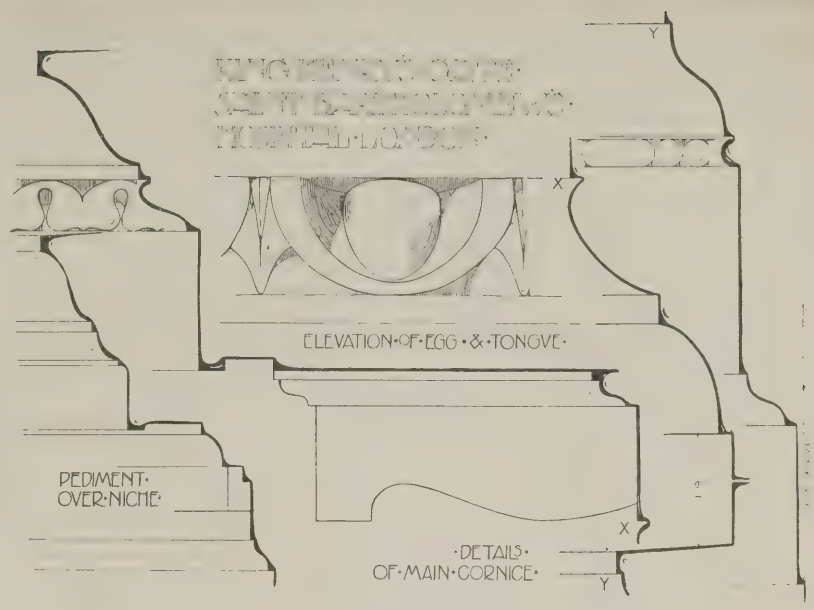
Local Hon. Secretary for Bombay.—In consequence of the death of Mr. J. Campbell, F.R.I.B.A. the local hon. secretary for Bombay, it became necessary to appoint a successor, and Mr. C. S. Stevens, of that city, has kindly consented to act.

Registration.—The Council continues to be fully alive to the necessity of increased activity in forwarding the statutory education and registration of architects, and has appointed a committee to confer with the Architects' Registration Bill Committee (a body of architects distinct from the Society) with a view to additional co-operation, or, if thought desirable, taking over its work.

Finances.—The balance-sheet to be presented at the November meeting will show the reserve fund to have been largely augmented and the finances administered with due regard to the interests of the members and the efficient working of the Society. Considerably over £500 has been placed to reserve during the session, the fund now amounting to £700 of which £500 has been invested in 2½ per cent. Metropolitan Consolidated Stock, the balance remaining on deposit at the bank.

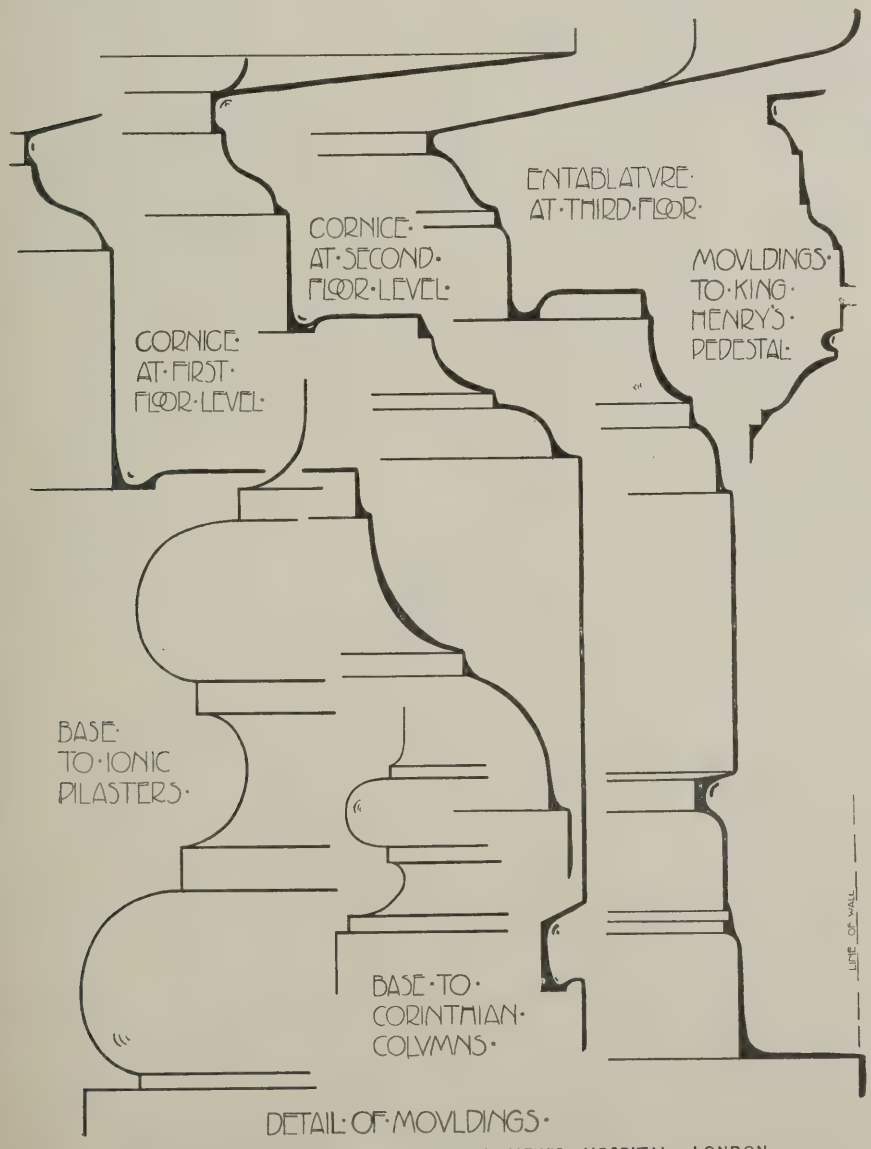
Register of Employment.—Several posts have been filled through the medium of the register, but it is not made use of to the extent it might be, and members and students are reminded that they have the free use of it and that it is conducted for their benefit.

Generally.—The Council report continued progress in every department of the Society's work.



It is the wish and aim of the Council to make the Society of more practical use to

the members, particularly those who, practising at a distance, are unable to keep in personal touch with headquarters. Such members should claim their privileges and use the Society's premises when in town, communicate with the secretary on any matter affecting their interests as members or their position as architects, or retain the services of the Practice Committee for advice on points of practice. The Council is always glad to receive, and if possible act upon, suggestions for extending the scope of the Society and the privileges of membership, but the future of the Society rests not so much with the Council as with the general body of members, for only with their co-operation can full advantage be taken of its continued and increasing prosperity and influence. The membership of the Society is higher than it ever has been at a corresponding period in any year, the total now standing at 597.



The election of officers resulted as follows:—President, Mr. Silvanus Trevail (Truro); vice-presidents, Mr. Walter W. Thomas (Liverpool) and Mr. G. Gard Pye (London); hon. secretary, Mr. Ellis Marsland (London); hon. corresponding secretary, Mr. W. R. Mallett (London); hon treasurer, Mr. H. G. Quartermain (Merton).

Council, Messrs. R. G. Bare (London); W. R. Bryden, F.R.I.B.A. (Buxton); Charles Caine (Manchester); F. W. Chancellor, M.A., (Chelmsford); W. Cooper (Hastings); J. W. Dyson (Newcastle-on-Tyne); W. L. Grant (Sittingbourne); W. J. Jennings, F.S.I. (Canterbury); H. E. Knight (London); F. W. Macey (London); A. E. Pridmore, F.S.I. (London); and B. R. Tuck (London).

Mr. Frederick Broadbent (Whingate, Leeds) was elected a member of the Society, and Messrs. Noel F. Barwell (London, W.C.) and W. J. Pulford were elected students.

Surveying & Sanitation.

The Sanitary Work and Drainage at Messrs. Gooch's new Premises in the Brompton Road, S.W., is being carried out by Messrs. George Jennings, Ltd., under the architects, Messrs. Ford, Son and Burrows. The firm is also executing the sanitary work, drainage, &c., at the Bank of England's new premises for the National Debt offices in Old Jewry and Princes Street, City. Mr. A. C. Blomfield is the architect.

A Great Sewage Engineer.—James Hobrecht, who has just lately died, was one of the most famous of modern engineers and the author of the Berlin sewerage system, in many respects the best ever devised for a great city. More than forty years ago the municipal government of Berlin sent an engineer Commissioner to England and France to study the most improved drainage systems of inland cities, with a view to their application to the needs of Berlin, and with this Commissioner was sent James Hobrecht, then a young architect, as assistant. Hobrecht was a skilful draughtsman, and his sketches served, after the return of the party, to illustrate the report of the Commissioner on the "Drainage of Berlin." The Commissioner, Wiebe, was, as a result of his investigations, charged with the preparation of a plan for the sewerage of the city; and, according to the practice then in vogue, he drew up a scheme by which the little River Spree was made to receive all the drainage of what, even then, was a city of 550,000 inhabitants. Hobrecht, more far-seeing, appreciated the difficulties which would result from loading a little fresh-water stream, far from the sea, with the sewage of a great and growing city, and made up his mind that the only successful method of disposal must be sought in some form of irrigation, for which the flat, sandy plain surrounding the city afforded certain advantages. Although Milan and Edinburgh had practised sewage irrigation on a small scale for some years, no great city had yet attempted it; and all Hobrecht's enthusiasm and force of character were required to persuade the Berlin authorities of its practicability. The plan of Wiebe for pouring a flood of sewage into the Spree was, however, set aside in the meanwhile, and it was finally decided to adopt in general the project that Hobrecht advocated. Fortunately, this project was a comprehensive one; and although Berlin has now nearly 2,000,000 inhabitants, and certain details of the system

have been modified in extending it, the irrigation-fields still dispose of the drainage satisfactorily. The architects, who always considered Hobrecht as one of themselves, although his work was rather engineering than architectural, made him a Director of the Berlin Architectural Society. After his great work at Berlin was complete, he was immediately called to carry out similar undertakings elsewhere, and Moscow, Tokio, Cairo and Alexandria, besides Stettin and Darmstadt, owe to him their drainage systems.

The Oiled Road in Wet Weather.—The experiment with the oiled road at Farnborough was mentioned last week at the meeting of the Farnham Rural Council. The surveyor stated that the experiment was satisfactory while the dry weather prevailed, but under wet conditions the road was in a very bad state. Indeed, it has been described as a mass of slimy mud, the mixture of water and oil producing a vile compound.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Open-air Pulpits.

IPSWICH.—J. M. writes: "A Wesleyan church in course of erection at Ipswich, from designs of Messrs. Eade & Johns, has an external pulpit. I am unacquainted with any other example of a pulpit in this position in a Nonconformist place of worship in this country, and should be glad if you could refer me to any examples or illustrations of such pulpits. I believe this feature is not unusual in our modern Established churches, and also in mediæval churches in this country."

You are probably right in your assumption that no other dissenting place of worship in the United Kingdom has an external pulpit. The best known, and indeed the only, example of the kind in London—until quite recently—is at St. Mary's New Church, Whitechapel, E. Now, however, one has been placed outside St. James's Church, Piccadilly, W.; indeed, it was first used only a few weeks ago. The first example of an old stone pulpit in England is that which is generally known as "the Reader's Pulpit" at Shrewsbury Abbey. This occupies its original site (now a coal-yard), but was originally the refectory rostrum, and thus within the abbey. It dates from towards the end of the reign of Edward III., *i.e.*, 1350-1360. It is a most exquisite fragment of fourteenth-century architecture, but was probably only treated as it is at present, an external pulpit, by the destruction of the roof and other portions of the surrounding buildings. A good example of an external pulpit may be seen in the first court of Magdalen College, Oxford. History says Archbishop Laud preached therein. It formed a portion of the Hospital of St. John, which formerly stood upon the site of the college in question. Some portions of the building were spared and incorporated by Waynflete when he built the present college (1473-1481). One might mention many external pulpits abroad. I saw a fine one quite recently, having a most elaborate groined and spired canopy above it, in the church of Notre Dame at Vitré, an old walled town situated upon the River Vilaine in a picturesque part of the Department of Ille-et-Vilaine in France; and there is a similar one, although not quite so ornate, on the north side of the Cathedral of Notre Dame at St. Lô, in Normandy. At Aschaffenberg, near the forest of Spessert in Germany, an external pulpit may be seen at the Minster church. There a distinctly German stone parapet of pierced geometrical open tracery runs around the churchyard at some height above the ground, and is made to project, at one corner, upon a semicircular corbel, thus forming a commanding pulpit. The same sort of treatment may be seen at Bamberg in Bavaria. At Schwäbisch-Gmünd, Würtemberg, there are a couple of chapels, built one above the other, or rather excavated out of the actual rock itself, the lower one being a kind of grotto. The upper, however, is vaulted (probably fifteenth century). Level with this second chapel is an external octagonal stone pulpit carried up from the ground by a circular column, resting in turn upon an octagonal base. Above the carved capital that surmounts this tall column the base, carrying the actual pulpit, coves out. The pulpit has upon each cant a recessed panel containing a figure. It has a projecting sounding-board, which, if I remember correctly, is of wood. Another instance of an external pulpit in Germany is at Hedingsfeld, near Würzberg, also in Bavaria. A projecting external pulpit occurs in the north wall of the choir at Vienna Cathedral from which it is recorded St John Capristan preached his crusade against the Turks in A.D. 1451. Beside external pulpits to churches and cathedrals, pulpits in cemeteries are to be seen in Germany. A well-known example may be mentioned at Mainbernheim, in Bavaria, wherein, in the cloistered cemetery, is a tall isolated stone pulpit of somewhat debased classical design, to which access is gained by winding stone steps. It is crowned by an ogee-outlined roof surmounted by a vane. Going for a moment, in conclusion, from external stone pulpits to internal oak ones, that at Fulbourne, a village not far from Cambridge, lays claim to being the oldest in the kingdom. It apparently dates from about A.D. 1350. At Mellor Church, Derbyshire, is another ancient pulpit, which—with, I think, much less reason—also claims priority on the score of antiquity. The body, which is a polygon, is hewn out of a solid oak butt and has tracery panels carved therein upon five of its sides. This portion is said to be early fourteenth-century work. The cornice and base are Jacobean, or later.

HARRY HEMS.

Retaining Bills of Quantities.

ROCHDALE.—J. P. writes: "Is it the custom of the unsuccessful builders to keep the bills of quantities supplied to them for the purpose of tendering?"

Yes, they are allowed to keep them.

The Letters "M.R.I.A I."

LONDONDERRY.—O. R. writes: "What do the letters 'M.R.I.A.' stand for? Kindly give the name and address of the secretary of the Architectural Association of Ireland."

The letters "M.R.I.A.I." signify Member of the Royal Institute of the Architects of Ireland. The honorary secretaries of the Architectural Association of Ireland are Messrs. George F. Beckett and A. G. C. Millar, and their address is 22, Clare Street, Dublin.

Mahogany Doors, &c.

LONDON, W.C.—H. E. W. writes: "(1) Are 'polished mahogany doors' usually made of Honduras mahogany framing with the panels only of Spanish mahogany, if nothing is specified to the contrary? (2) Would such a combination be satisfactory if the doors were left unpolished? (3) What is the best economical form of pugging to use between joists to deaden the sound over a billiard-room and prevent heat and cooking smells being noticeable in a room over a kitchen? (4) What is the best method of filling in between the studs of a partition to make it solid in a case where brick nogging would be too heavy for the joists supporting it?"

(1) Experts contend that there is no Spanish mahogany to be obtained nowadays. Honduras is usually used. (2) Yes. (3) Slag-wood. (4) Ditto.

Engineering Notes.

Electric Trams at Colchester on the overhead principle are to be built for the Council at an outlay of nearly £70,000.

The Baptist Schools, East Finchley, have been fitted with the latest improved hot-water heating apparatus by Messrs. John King, Ltd., engineers, of Liverpool.

The City of Sheffield Hospital, Lodge Moor, has been supplied by Messrs. E. H. Shorland & Brother, of Manchester, with their double-fronted patent Manchester stoves in glazed faïence and under-bed ventilators.

Rebuilding a Glasgow Bridge.—Auldhouse Bridge, Pollokshaws, is to be rebuilt according to plans prepared by the district road surveyor and the burgh surveyor. The cost of the work, including widening the approaches, is estimated at £3,359

A Consulting Engineer's Affairs.—The public examination of Frederick H. Bowman, consulting engineer, of 30, Victoria Street, S.W., was held last week. His failure was due to his losses in connection with the Higher Antley Brick and Tile Co., Ltd., of which he was chairman until the company went into liquidation in or about April, 1901.

Electric Lighting Profits at Leyton.—The Leyton Urban District Council is announced as having made a profit on its electric light supply station during the past six months of £700., according to a statement just made by the council's electrical engineer, Mr. F. H. Lewis, A.I.E.E. Whereas in 1897—the year in which the station was inaugurated—there were only 2,982 lamps connected with the system, and 28,591 units sold in the twelvemonth, at present there are 40,000 lamps connected, and the financial year now closed saw a total of 811,141 units sold.

Electrifying the Liverpool and Southport Line.—This was decided upon last week by the directors of the Lancashire and Yorkshire Railway Co. The section is about 18½ miles long, and carries an enormous residential traffic. It is anticipated the new trains will be running in about nine months. If this be done the Liverpool and Southport Railway will be the first main line in this country to be converted to the new system. The line will be worked on the three-rail system, the generating station being midway between Liverpool and Southport. The time to be taken for the journey between Liverpool and Southport, including about ten stoppages, will be half an hour.

Masters and Men.

The Government and the Penrhyn Quarry Dispute.—In the House of Commons last week Mr. Field asked the President of the Board of Trade whether he would follow the course adopted by President Roosevelt respecting the coal strike in America in the case of the Penrhyn Quarry dispute. Mr. G. Balfour said the circumstances in the case of the Penrhyn Quarry dispute were by no means similar to those in America, and he saw no prospect that any official intervention would tend to promote a settlement.

THE ADELPHI TERRACE.

IN a letter to the "Times" an F.R.I.B.A. says: "Surely it ought to be borne in mind that the Adelphi is a site of very considerable historic and architectural interest, not to be lightly swept away. It was the scheme of a very remarkable man, Robert Adam, one of the few architects who had sufficient personal power and ability to almost create a style of his own, and not only to impose his taste upon his own generation, but to create a school of classic detail which it has been thought worth while to revive, with much admiration and a diligent cult, in the present generation. The Adelphi streets and buildings, called after the names of himself and his brothers, were practically a kind of monument of his success. Those houses are not only thus connected with the name and genius of an eminent Englishman (or, rather, Scotchman), they are full of beautiful detail in chimney-pieces, ceilings, &c., not to speak of the historic house of the Society of Arts, which contains, among other things, the earliest modern attempt at monumental mural decoration in this country by Burke's friend Barry, bad from the point of view of the present day, but historically interesting; and architecturally the interior of the house is really valuable. All this the London County Council, which ought to set the example of respect for architectural memorials in London, coolly talk of demolishing, as if it were merely a collection of warehouses."

A report of the London County Council's meeting will be found on p. 182 of this issue; those who are not familiar with the Committee's recommendations in regard to this Terrace might refer to p. 163 of the BUILDERS' JOURNAL for last week.

GOTHIC CONSTRUCTION.

A Lecture by Mr. Arnold Mitchell.

MR. ARNOLD MITCHELL, F.R.I.B.A., delivered a lecture on "Some Interests of Mediæval Architecture" before the Architectural Association of Ireland last week. He dealt with the characteristics of the earlier and middle Gothic construction and ornament, and pointed out that the buttress and pinnacle were directly the outcome of the arcuated system of construction, which was the essence of Gothic work. He described the method by which the builders of olden time obtained the effects which they sought—the use of small stones (because these were carried up the scaffolds on men's backs, the time of weight-lifting machinery not yet having arrived), the making of this compulsory use of small stones a means for good effect, the recessing of arches in thick walls, and consequent beautiful effect of light and shade. The lecturer then went on to point out several instances in which the thoughtfulness of the mediæval builders was very evident—the raising of the bases of columns to the inner arcade in the triforium at Westminster and elsewhere, and the carving of the round arched spaces over doorheads, where, as occurs in many places, the door proper is covered by the lintel, while there is a semicircular arch over, projecting beyond this out to the general face of the wall. He drew attention to the great difficulty of designing figure-carving in such a way as to properly fill a space like this, and the still greater difficulty of doing so when of necessity a number of horizontal and vertical stone joints crossed the design; and pointed out how successfully these difficulties had been overcome in the instances shown on the screen. It was particularly noticed how the wings and draperies of the figures had been disposed to suit the joints, with the very best effect. The lecturer showed and described many examples of carving to bring out the fact that all the old ornament had its own peculiar meaning and interest. This was emphasized in a photograph showing a number of heads, forming stops to label mouldings in a nave arcade, where it seemed probable that these heads were likenesses of the various monks who took part in the work of building the church. The lecturer also drew attention to the possibility of obtaining a very rich and beautiful effect by mouldings alone, without the assistance of sculptural decoration; he instanced this by a reference to Salisbury Cathedral, where the only occurrences of carving—as apart from moulding—are in the brackets carrying the ribs of the nave vault. He closed with a reference to the principle which actuated mediæval builders in the latter days in their carving—that they did not actually copy natural forms, but used them as a motive and suggestion for their work, and suited the refinement and character of the work to the nature of their material.

ADELPHI TERRACE LONDON, LOOKING EAST. ROBERT ADAM, ARCHITECT. [*Photo: E. Dockree.*

A Large Consumption Hospital at Beelitz near Berlin, has just been completed at a cost of nearly £450,000. The hospital, which is intended exclusively for the working classes, has both male and female divisions, and is believed to be the largest consumption hospital and most perfectly equipped in the world. Nearly £60,000 annually will be required to keep it up. It will accommodate 600 patients. The buildings are surrounded by extensive pine woods.

New Patents.

These patents are open to opposition until December 1st.

1901.—Cutting Large Holes in Wood.—18,913. J. DAVIDSON, 10, Gladstone Street, and J. DAVIDSON, 18, Annie Street; both of Sunderland. The device consists of a barrel with a screw at its base for fixing it to the work, and an arm which rotates around this barrel with cutters at its outer end for forming the hole.

Wood Flooring.—20,287. J. WEHINGER, Dornbirn, Vararlberg, Austria. This invention relates to a machine for making wood mosaic flooring in which the blocks are linked together by wires. The wire is threaded through the blocks after the manner of weaving.

Door Top Hinges.—22,946. J. H. CARTLAND, Constitution Hill, Birmingham. The hinge is of the type having a pivot fixed to the underside of the door frame, fitting into a bearing screwed to the top of the door. This hinge is subject to excessive wear, owing to the great difficulty of lubricating it. To remedy the defect, the bearing according to this invention has a groove on its upper surface leading into the pivot hole, into which the oil may thus be easily run.

Hot-Water Heating Apparatus.—24,605. W. B. TAYLOR, 11, Waterville Terrace, North Shields. The boiler, which is heated by gas, consists of two domed-shaped shells, the coil within them being packed with asbestos blocks to economise heat.

1902.—Parallel Rulers, Protractors, &c.—679. V. S. HOWARD, Merivale, Beckenham, Kent. The ruler has serrated rollers, but it can be moved sideways as well as up and down. It is also possible to raise the protractor clear of the paper when desired.

Sink Supports.—17,468. M. J. ADAMS, 72, Park Lane, Leeds. The bracket support has the waste passing through it into the leg, which is connected with the outlet pipe. An inspection eye is provided.

The following specifications were published on Thursday last, and are open to opposition until December 8th. A summary of the more important of them will be given next week. The name in italics is that of the communicator of the invention.

1901.—17,581, LOWE, sewage filters. 19,474, CROIZIER & THOMINE, artificial stone. 20,403, SWALLOW, elbow and other fittings for pipes. 21,220, HARRISON, window fastener. 21,850, OSMENT, apparatus for finishing off the edges of doors, sashes, &c. 21,898, LAWSON, cramps. 22,012, LANDER AND SIMPLEX STEEL CONDUIT CO., LTD., fittings for conduit systems of electric wiring. 22,288, WALSH, temporarily fixing together grates and chimney-pieces in showrooms. 22,435, WAIT, apparatus for operating fanlights, &c. 22,732, GALLEY, door bolt and check. 22,735, COGHLIN, tie-plates. 22,960, WINTERFLOOD, valve attachment for geysers. 23,201, SHONE & AULT, self-closing valves. 23,236, PERRY, slide-rules. 23,391, BICKFORD, valves. 23,907, MACAULAY, combined wood and metal channels for sewage. 23,962, BURGHARDT, HALL & JONES, tiles, plates or slabs for walls, ceilings, &c. 24,079, BINNS, SPEIGHT AND BINNS & SPEIGHT, LTD., hot-water and steam heating apparatus boilers. 24,194, WAINWRIGHT, closet seats.

1902.—1,461, KRUSE, scaffolding. 5,541, FIRTH, removal of paint from metallic surfaces. 6,605, LAKE (*Bardsley*), spring hinges. 6,936, YOUNG, valve seats. 11,716, NEWNS & STEVENSON, pipe wrenches. 12,788, KAYSSER, sterilizing drinking water. 13,710, PARSON, grate-bar. 14,527, TRAUTMANN, smoke-consuming devices for furnaces and other fire-grates. 15,785, MAXWELL, pulverizing mills. 17,493, JACOBY, valves. 18,194, JONES, taps. 18,775, SOBORSKI, apparatus for applying paint to floors, &c.

Builders' Notes.

The new Overcliff Drive at Bournemouth which has been constructed by the Corporation on the west cliff, at a cost of £10,000, was formally opened last week. The drive is over a mile and a half in length.

Guards Around Scaffolding.—In returning a verdict of "Accidental Death" on a bricklayer who was killed by falling off a scaffold on a building in Bunhill Row, E.C., the jury expressed the opinion last week that a guard should be placed around scaffolding.

Buildings Collapse in Sunderland.—Whilst Corporation workmen were demolishing several old houses at Drury Lane, Sunderland, one day last week a stretch of buildings comprising three houses collapsed, the outer wall and roof falling into the street. Two workmen were injured.

The Columbian Fireproofing Co.: New Works in London.—Mr. L. V. Childs, chief engineer to the Columbian Fireproofing Co., who has been in London for the past three years in charge of the company's business here, is now at Pittsburgh inspecting machinery and equipment for a steel construction plant which the Columbian company proposes to erect at St. John's Wood, N.W., where two acres of ground have been acquired, and where a shop is being erected that will give employment to sixty men. The Columbian company intends to take up the structural steel business in England as well as fireproofing floors. The steel will be bought in the best markets (American if possible) and will be made into shapes for building purposes at the new works.

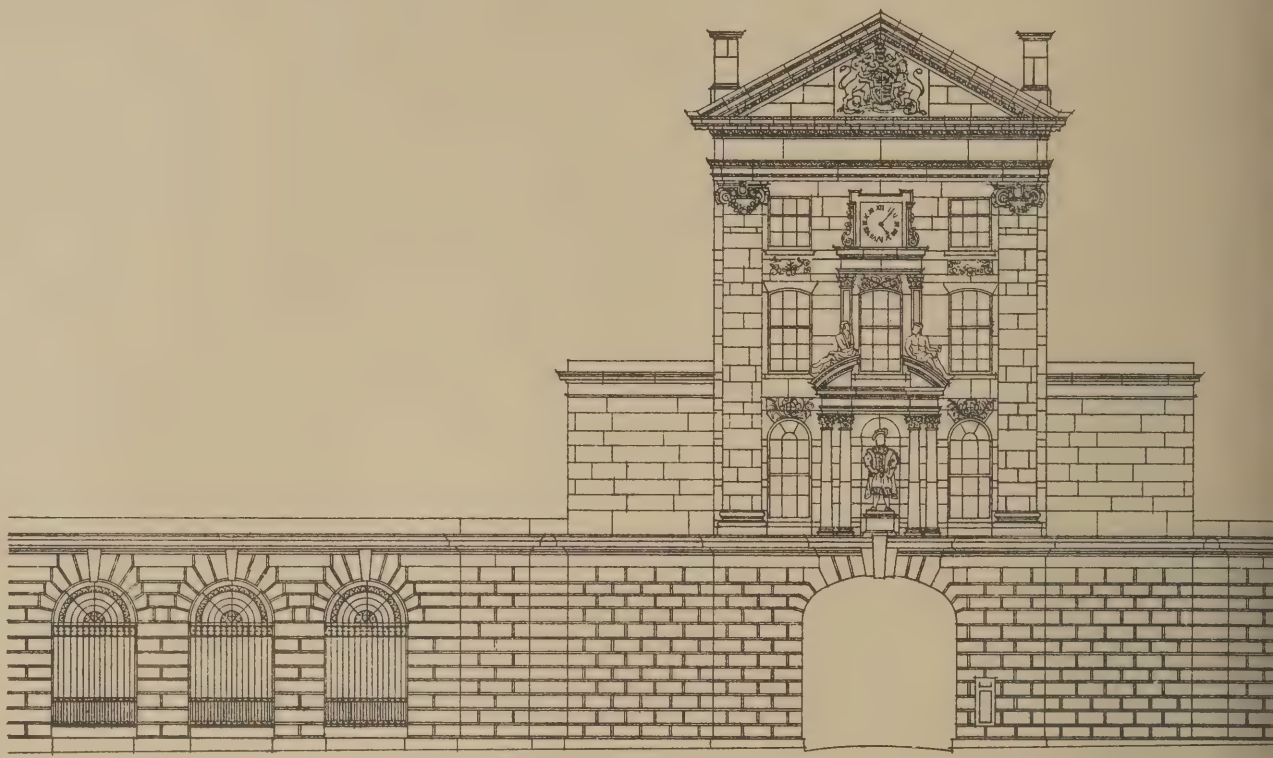
Fire Test with a Warehouse Floor.—A full-sized oak warehouse floor was subjected to a fire test last week at the testing station of the British Fire Prevention Committee, the object being to test its resistance against a severe fire of two hours' duration whilst loaded to the extent of 2 cwt. per sq. ft., the actual flooring only being 2½in. thick. The result was that while the fire did not break through the floor for a considerable time, it penetrated at several points towards the end of the test, and a considerable portion of the planking was entirely burnt away. The test was one of considerable importance for comparisons with tests with Colonial hardwoods, from which a greater resistance is obtainable, as also with the various kinds of composite fire-resisting floor in which the ironwork is unprotected with the result that expansion brings about collapse. An official report on the test will be published in due course.

London County Council.—At last week's meeting of the London County Council Mr. Beachcroft moved that the recommendation of the Adelphi site for the proposed county hall be referred back with an instruction to the Committee to report at what cost certain property in Spring Gardens could be acquired: but this proposal was defeated. Mr. Cohen then moved "That, before coming to a decision on the Adelphi site, the Committee be instructed to report on the advantages of a site south of the Thames, adjacent to Westminster Bridge." This proposal was also defeated. A division was taken on the recommendation of the Committee, 50 voting for it and 50 against it. After some discussion the chairman said he must accept the division list as handed to him, but a note could be added in the minutes recording the fact that Mr. Cousins tendered his vote and it was not accepted.—Replying to Mr. Beachcroft, Dr. Cooper said the Council had no power to spend money on investigating the atmospheric conditions of the tube railways, but they had recommended the Parliamentary Committee to deal with the subject when dealing with Tube Railway Bills.—In answer to a question by Mr. Sankey, Mr. Piggott said it was a fact that Buccleuch House, Richmond, the residence of Sir Whittaker Ellis, was for sale, and if the site were built upon it would destroy the view from Richmond Hill. Sir Whittaker Ellis, however, was under a covenant not to build. On the opposite side of the river was Cambridge Terrace Gardens, and Sir Whittaker Ellis promised, when the Marble Hill estate was being acquired, that these gardens should not be further built upon.

OUR IGNORANCE OF ROMAN ARCHITECTURE.

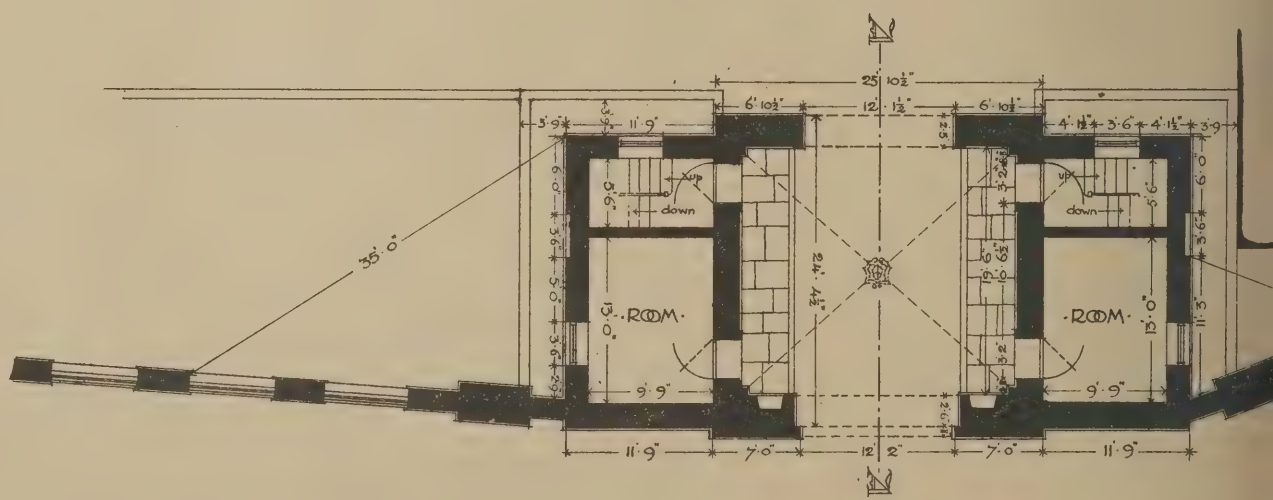
WRITING to the "Times" in reference to the British School at Rome, Professor Aitchison, R.A., says:—This School was undoubtedly started for the help of every student of the Latin Classics, of classic and mediæval archæology and of classic topography, as well as of Roman architecture; and considering that, next to poetry, architecture is the most important fine art, I think a due proportion of the available time should be devoted to the architecture.

With the exception of Taylor and Crecy's "Architectural Antiquities of Rome," I know of no English publication devoted to Roman architecture, except the studies of it that were made and published by the Italian Renaissance architects and translated into English, although there is the greatest dearth of information on the uses to which many parts of buildings were put and as to the dates at which certain characteristic forms and methods of building first came into use—*i.e*, the conversion of the Greek orders into the Roman. The learned M. Auguste Choisy is, as far as I know, the only modern author who has devoted himself to the methods of construction among the Romans, and we badly want to know from what people the Romans learnt the art of building in concrete. The ages of many buildings are unknown and are not by any means easy to be got at, for mostly the first dedicator of the building had his name inscribed on it, and not the last restorer, and most of the aqueducts are of an unknown age; for example, Agrippa had his name inscribed on the frieze of the Pantheon, although the one we have is believed by M. Chedanne to have been built at the expense of Hadrian, and the architects were not even named. The poets were more lucky, for Augustus did not put his name to the poems of Virgil and Horace . . . .



Your contributor says, "Not only on the artistic side has Rome the superiority." On this question he does not appear to be well informed, for even taking the inside of the Pantheon, which is by far the finest of any Roman structure at Rome, it is not to be compared with the perfection of Athenian architecture at its best, which has hitherto been unrivalled in the world, and is the highest expression of architectural art that we possess.

OUR NEW COMPETITION.



IN our issue for last week full particulars were given of a new competition for architectural students, with prizes of £5 5s., £3 3s. and £2 2s. The problem is to re-design the front of No. 182, Fleet Street, London. Designs must be sent in between November 25th and December 1st next.

SOUND-PROOF PARTITIONS.*

A Series of Tests.

THE subject of fire-resistant partitions and of heat-resistant coverings for wooden surfaces has long since been investigated on behalf of the Factory Mutual Fire Insurance Companies. There are many places in factories where it is desirable to put up partitions sufficiently light to be supported on the timbers without the necessity of building from the foundation. There are also many stairways, elevator-wells and belt-chambers in mills where it is desirable to put up a fire-resistant partition without going to the heavy expense of encasing it in brick.

The materials and method of constructing such partitions vary with the conditions in each case. Thin metal, plastering on wire laths, expanded metal and other methods have been applied in different cases.

Among the heat-resistants, the Sackett's Plaster Board proved to be one of the most effective for covering wooden surfaces or partitions made of plank. This material is made ¼in. in thickness and may be made thicker. It consists of four layers of felt and three layers of magnesium plaster. It is made in large sheets and may be fastened up in various ways at a moderate cost. It is then covered with "brown plastering" so-called, and finished with a skim coat of hard plaster. The partition occupies a very small space; some which were put up in the office occupied by the undersigned, about two years since, without interfering with the daily work in any considerable measure, have proved to be free of cracks or any discolouration, taking up very little space. In this instance, the plaster board was nailed to seasoned wood-studding.

So far as we could judge, this material also retarded the passage of sound.

When the subject was submitted to Professor Norton by the architect in charge of the construction of a dormitory or dwelling-place for students in the New England Conservatory of Music, arrangements were made for including this material with others. The report of Professor Norton is herewith submitted.

Cabot's Quilt, recommended in connection with this material, is made of dry seaweed, padded between two thicknesses of paper, which, in buildings of fireproof construction, should be asbestos paper.

The architect in charge of the construction of the building of the New England Conservatory of Music, in which instruction is to be given, has adopted a partition of the Keystone Fireproofing Co.'s blocks with the Cabot's Quilt between the two sections.

These buildings are both approaching completion, so that ere long a practical test will be possible by which the relative sound-proof quality of each partition may be determined.

EDWARD ATKINSON, Director.

Report of Mr. Charles L. Norton.

The subject of partitions for fireproof buildings is one which has led to much investigation, especially by the New York City Building Department.

When it is desired to make a partition which shall be reasonably sound-proof, it is apparently necessary to diminish somewhat the absolute incombustibility of the partition, though to a less extent than was supposed.

The following account of tests made for Mr. Edward T. Barker, architect of the dormitories of the New England Conservatory of Music, will show the relative values of some of the typical partitions of sound-proof separations between rooms.

There were built upon the concrete floor of the B. and A. warehouse, East Boston, five rooms, 7ft. square, whose side walls were made of the several partitions. The rooms were built upon a floor of the same kind as that which is to be used in the buildings for the students of the conservatory, for which the results of these tests were especially desired.

The rooms were built near one another on the fifth floor of the warehouse in a large loft or room about 50ft. by 70ft. long and 9ft. high. The ceiling of each room was the under surface of the concrete ceiling of the large room. Each room had a floor of two thicknesses of ⅛in. floor boards with two thicknesses of Cabot's Sheathing Quilt between the floor-boards and the concrete slab of the main floor. On one side of each room was a door with a glass panel, the door-jambs being faced with soft felt, and the bottom of the door was fitted with a stop or "weather-strip," operated when the door closed, making a tight joint at the bottom.

The side with the door will be referred to as the front in the following description:—

Room A: This room was submitted by the National Fireproofing Co., and its four sides were made of terra-cotta blocks. The front and back walls were made of blocks 4in. thick; the sides of 2in and 3in. blocks. After the blocks were in position the room was given two coats of plaster inside and out.

Room B was submitted by the Keystone Block Co., and its four walls were made of the blocks of the Keystone material of the nature of plaster-of-Paris with a fibrous bond. The front wall was of blocks 4in. thick, and the left side was of blocks 2in. thick, the back of blocks 3in. thick, and the right side of two 2in. blocks with a 2in. air-space between them. The entire room was given two coats of plaster inside and out, except the front, which had no plaster on the outside of the blocks.

Room C was submitted by the Sackett Wall Board Co. and was built of Sackett Plaster Board ¼in. thick, wired upon both sides of 3in. steel channels. The channel truss or studs of the back and right side were wrapped with felt about ⅛in. in thickness before applying the plaster board. The Sackett Plaster Board is a composite board of alternate layers of paper and plaster, the whole being about ¼in. thick. This room, like the other, was plastered inside and out, but to a slightly less thickness.

Room D was submitted by J. Russell & Co. and was of a more complex construction. The left side was a solid partition of metallic lath and plaster. The ⅞in. steel ties were spaced 16in. on centres, metal lath was applied to one side only of the ties, and then plastered to a thickness of 2in. The rear wall was built upon two rows of ⅞in. studs staggered. Between them were placed one thickness of waterproof paper about $\frac{1}{32}$in. thick and metal lath was wired to both sides of the row of studs and given two coats of plaster. The right side was of the same construction, with a layer of ⅛in. felt between the two thicknesses of waterproof paper. The front wall was of metal lath on two rows of staggered studs, with Cabot's Seaweed Quilt between the rows of studs.

Room E was submitted by Mr. Samuel Cabot, and was wholly of metal lath-and-plaster double partitions, with the space between the laths filled with Cabot's Sheathing Quilt. The front and left sides contained three thicknesses of quilt, and the right side and rear two thicknesses. The quilt was placed between the studs and the metal lath, and where three thicknesses were used one was between the row of studs as well.

The rooms had been vigorously dried for several days, none longer than a week, but the whole building was so damp and the time so short that no considerable part of the plaster and none of the interior portions of the partition were dry. The Sackett Board room was the driest and Cabot's was the least dry.

The preliminary trials showed so great a range of efficiency of the several constructions that the microphonic apparatus, which was designed to make rapid comparisons of sound intensity possible, could not be used. Reliance had to be placed wholly on listening with and without a felt-mouthed stethoscope at the outside of the partition to sounds of various quality and intensity from within. The notes of the piano, violin, cornet and the human voice were carefully tried throughout wide ranges of pitch and intensity. The performers and the instruments were interchanged: every possible chance of unfairness, due to the variations of intensity in the sounds used, was eliminated. Of course, no interchange of the positions of the room was possible. No electrically-driven tuning-fork could be used for producing sounds of constant loudness. The insulating property of some of the partitions was so good that not even the blare of a cornet or the overpowering tones of an Italian tenor, drawn from the ranks of the labourers on the building, could be heard through the partition, except by careful listening within a few inches of the wall.

After much consideration, the writer has given the following ratings to the different partitions. The order of their standing upon the list indicates their efficiency as compared with those above and below them.

No.	Room.	Side.	Scale.	Composition.
1	E	Left	100	Cabot s Quilt, 3 thick + metal lath.
2	E	Right	95	Cabot's Quilt, 2 thick + metal lath.
3	E	Rear	95	Cabots Quilt, 2 thick + metal lath.
4	C	Rear	85	Sackett Board, 2 felt on ⊏s.
5	C	Left	85	Sackett Board, 2 felt on ⊏.
6	C	Right	80	Sackett Board, 2 felt.
7	D	Rear	75	Metal lath + paper.
8	D	Right	75	Metal lath + paper + felt.
9	B	Right	60	Two 2in. Keystone Block with 2in. air-space.
10	A	Rear	50	4in. National terra-cotta blocks.
11	B	Rear	50	3in. Keystone blocks.
12	A	Right	45	3in. National terra-cotta blocks.
13	B	Left	40	2in. Keystone blocks.
14	A	Left	40	2in. National terra-cotta blocks.
15	D	Left	30	2in. Metal lath, solid plaster.

Nothing more is to be inferred from the numerical efficiencies than that the first partition is about three times as good as the last, and that the numerical interval between any two partitions on the list merely indicates the order of magnitude of the difference between the partitions.

The partitions making up the rooms submitted by Samuel Cabot and the Sackett Wall Board Co. were the most efficient; but it is distinctly to be born in mind that no other room had so easy a test as these did, in that each of the others had one thin and ineffective side which transmitted sound to the sides adjacent to it. The thin side of the Keystone room was noticeably resonant and plainly rendered it impossible to make a fully satisfactory test of the air-space partition. The solid metal-lath plaster partition of the room submitted by J. Russell & Co. acted in the same way in that room.

I do not believe, however, that this defect in the structures has caused any changes in the position on the efficiency list of the Cabot and Sackett rooms.

The efficiency of the Cabot Quilt as a material for rendering the partition "sound-proof" is so clearly demonstrated in these tests that I recommend it for use in the partitions for which these tests were made. The nature of the material in which the quilt is encased should be carefully considered. I do not think it within the province of this report to discuss the partition from other than acoustic considerations, and as an encasing medium the most effective material is Sackett Board and Adamant Plaster.

I would, therefore, give as my opinion that the best acoustic results would be attained by using a partition of Sackett

* From the "American Architect."

Board and plaster with two thicknesses of Cabot's Quilt between the plaster board.

I should recommend a wooden stud rather than steel channels, if the fire-risk is not materially increased thereby.

As later tests showed, some sort of a suspended ceiling will be needed, as the concrete slab transmits the sound across the top of the partition readily. No trouble will be given by the sound passing through the concrete to the rooms above or below; but, unless a layer of Cabot's Quilt, with under-lath and plaster, or of Sackett Board and plaster, be put on the under side of the concrete ceiling, the efficiency of the partitions will be diminished somewhat.

The front walls could not be tested because of the leaks around the door and through the door-frames, even where covered with a large shutter padded with Cabot's Quilt. It is evident that a double glass door will be needed. The floor construction is acoustically good.

Keystones.

A New Vicarage at Totnes is being built at an estimated cost of £2,040 from designs by Mr. A. H. Roe, A.R.I.B.A., of Brockley.

New Theatre for Colchester.—Plans for a new theatre which it is proposed to build at Colchester on a site east of the Town Hall have been submitted to the municipal authorities. The theatre is to seat 1,100 persons. Mr. J. W. Start, of Colchester, is the architect.

A new School at Helensburgh is to be erected in East Clyde Street. Accommodation will be provided for about 600 pupils. There will also be classrooms for cookery and laundry. The cost will exceed £10,000. The architect is Mr. Alexander N. Paterson, Glasgow.

A new Music Hall at Chelsea is being erected in the King's Road (facing the town hall) from designs by Messrs. Wylson & Long. The front is faced with buff terra-cotta, and has a frontage of 106ft. The auditorium will be 64ft. wide, 84ft. from the front wall to the line of the curtain; and the height from pit floor to ceiling, 46ft.

Congregational Church, Bury Park, Luton.—The tender submitted by Messrs. T. and E. Neville & Co., Luton, amounting to £4,429, has been accepted for this church, and building operations have been commenced. The architects are Messrs. George Baines, F.R I.B.A., and R. Palmer Baines, 5, Clement's Inn, Strand, London, W.C.

Fireproof Floors.—The Columbian Fireproofing Co., Ltd., of 37, King William Street, E.C., have commenced their contract for fireproof floors and roofs at the Kirkcaldy Electric Generating Station for the Kirkcaldy Corporation, and have now virtually completed their large job of floors and roofs at the electric generating station at Bow for the Charing Cross and Strand Electricity Corporation, Ltd.

The Old Roman Catholic Church of St. Mary's, Moorfields, it will be remembered, was recently pulled down for the Liverpool Street improvements, and the immense picture on one of the walls, representing the birth of Christ, destroyed, although the work was valued at £10,000. The new church, built in Eldon Street, close by, is almost completed, and will be consecrated next month. It is smaller than the old church, which was the largest in the City. Electric lighting is installed, while the greater part of the natural light comes from the roof, there being scarcely any window space at the sides, owing to the building being closely hedged by blocks of shops and warehouses

A New Library and Technical School at Newton Abbot is being erected. The architect is Mr. Silvanus Trevail, F.R.I.B.A., of Truro and Westminster, and the builder is Mr. Henry Goss, of Torquay.

A Life-size Marble Statue of Queen Victoria has just been completed by Mr. Francis Williamson, of Esher, for erection at Perth, Western Australia. The statue, which is the gift of Mr. Allen Stoneham, is mounted on a granite pedestal.

A Consumption Hospital outside Liverpool has just been completed. The site is at Heswall, in Wirral, and provision is made for twenty-four beds. The land, building and furnishing have cost about £12,000. The architect was Mr. Charles H. Lancaster, Liverpool; the builder, Mr. Thomas Spencer, Aintree; and the clerk of works, Mr. C. P. Green, Heswall.

A Magnificent Bronze.—The superb bronze statue of an athlete which was found in fragments at the bottom of the sea near Cerigo (Cythera) in January last year has been successfully restored by M. André, the French artist, and will soon be exposed to public view in the Athens Museum. The statue, which is of extraordinary beauty, may be classed among the finest existing remnants of ancient art; as an original bronze of the best epoch it is unique. It presents many features of the school of Lysippos, and may possibly be the work of the great sculptor.

At the Broad Street end of London Wall, E.C., a small building has been erected as an extension of All Hallows Church for the purpose of a shelter for working men who arrive in the city by the early trains, hours before their places of employment are open. The front is of stock bricks with red gauged elliptical arches and stone dressings. The architect is Mr. Newton, of Thornton Heath, and the building has been carried out by Mr. J. W. Heeps, of London Wall, under the superintendence of Mr. C. Dickinson as general foreman.

A New Cattle Market at Braintree has been erected at the north-west corner of the old Fair Field. The architect was Mr. F. Whitmore, of Chelmsford; and the work has been completed at a cost of just over £2,000. Pen accommodation is provided for upwards of 200 pigs, 820 sheep, 24 beasts, and 40 calves, with an open space of 4,600 ft. super. for loose cattle. There is a stand for horses and a horse run, with a large open shed and two spacious and lofty stables. On each side of the main entrance there is a building for office purposes, &c.; and the whole area, about an acre in extent, is paved and drained.

A Three-Light Window in Errigal Trough Parish Church, Co. Monaghan, Ireland, has been erected. The lights are lancet-shaped; in the centre one is a figure of St. Bartholomew, and in the side ones are the arms of the See of Clogher and the See of Armagh, while the remaining ornament consists of clusters of Passion Flowers, &c., &c. The window was carried out by Messrs. Abbott & Co., of St. John's Studio, Chapel Street, Lancaster. The same firm has secured the contract for the whole of the leaded glass required for the new Kursaal, Harrogate.

The Auctioneers' Institute.—The opening meeting of the session of the Auctioneers' Institute of the United Kingdom was held on Wednesday evening last at the Medical Examination Hall, Victoria Embankment. The president of the Institute, Mr. John Hepper, who was in the chair, delivered the inaugural address. He referred to their application for a royal charter, and said that the refusal had disappointed them. It was opposed by the councils of the Surveyors' Institution, the Royal Institute of British Architects, and the Chartered Accountants of England and of Ireland.

Buccleuch House, Richmond, Surrey, was offered for sale last week, but was withdrawn at £17,500.

A Statue of a Finnish Patriot.—A colossal statue was unveiled recently in Helsingfors of the great Finnish patriot and savant, Elias is Lönnrot, who was born in 1802, and died, greatly honoured, in 1884. It was executed by the Finnish sculptor, Mr. E. Wikström.

The Trinity Presbyterian Church, Kentish Town, which was to have been reopened on Sunday after repairs, caught fire on that day, due to a stove in the schoolroom being lighted. The church stands at the Camden Town end of Kentish Town Road. The flames were prevented from enveloping the church. It has, however, sustained serious damage. The woodwork of the whole of one side of the interior had been badly scorched and part of the roof burned off, in addition to considerable damage done by water to the roof and other portions of the interior, on which £200 had been spent only recently. The school was destroyed, and altogether the damage is estimated at £1,000.

Another London Church.—The foundation stones of the London Baptist Association Church, Mitcham Lane, Streatham, S.W., were laid last Thursday, October 23rd. It is Perpendicular Gothic, freely treated in style. The facings are of pressed red bricks with dressings of Bath stone. A bold tower forms a prominent feature at one corner. The estimated cost of the complete block (without upper portion of tower) is £5,238, the latter being £440 extra. The portion at present being erected is the tower, nave and vestries only, together with temporary apse. The architects, whose designs were accepted in a recent competition, are Messrs. George Baines, F.R.I.B.A., and R. Palmer Baines, 5, Clement's Inn, Strand, London, W.C.

L.C.C. Memorial Tablets.—The Historical Records Committee of the London County Council in their last annual report just issued, mention the Council's acquisition of the house, 17, Fleet Street, originally built in, 1610 for Henry, Prince of Wales, as an office of the Duchy of Cornwall, an almost unique specimen of the architecture of the period. Rebuilding and restoration works have been executed. In the case of Christ's Hospital, Newgate Street, doomed to demolition, the committee were permitted to take photographs and measurements of the principal architectural features of the buildings for the purposes of record. The committee keep a record of London's historic buildings, and to them, or the Council, has passed with the consent of the Society of Arts, the work of affixing memorial tablets to the external walls of houses which have been the residences of famous men and women.

The Church of St. Thomas of Canterbury, Salisbury (dating from the fifteenth century), is in great need of external repair. The church, which is seated for about 1,000 persons, is remarkable for its lofty choir and nave, with clearstory throughout. It has an exquisitely panelled ceiling and fine mural paintings, while the tower is held by some to be of earlier date than the rest of the fabric. The committee have placed the work in the hands of Mr. T. G. Jackson, R.A., who has reported that the nave arcades have settled westward, and that all the columns have a slight inclination in the same direction. He proposes to remedy this by adding substantial buttresses to the west end. The tower, he finds, inclines so much to the south that the point of the spire, which is 95ft. from the ground, has moved about 2ft. 3in. from the perpendicular axis. The roof of the south chancel aisle is in a bad state, and will require reconstruction. It will also be necessary to take off and recast much of the lead on the roof. The total cost of the work is estimated at £5,000.

THE ART AND TRADE OF HOUSE DECORATION.*

By LEWIS F. DAY.

THE distinction between art and trade is obvious. They represent the two pposite poles of occupation—in theory. In ractice the two things are inseparable—if y trade we mean not merely the dealing i a thing but the doing it—and I take it iat *is* included in house decoration.

In every occupation by which men earn a iving there is (and always has been) an lement of trade.

In all work of man's hand in which it is ossible for him to take a pride there is an lement of art.

And yet it is sometimes disputed whether rt and trade are reconcilable one with the ther!

To my mind the only question is as to the *egree* to which trade enters into art, or art an enter into trade, without prejudice in ie one case to artistic, in the other to com- iercial, success.

Art is a means of livelihood—but by no ieans of livelihood only. or it soon ceases o be art at all. Handicraft is a means of rtistic expression, but by no means of rtistic expression only, or it soon ceases to ay.

Here let me explain. I have been using ie word trade, so far, perhaps too much in ie old sense of "trade, art or mystery" of oing something. We use it in the present ay more in the sense of "dealing."

Perhaps it will save possible confusion if adopt in future the term "handicraft" (or craft" for short) in speaking of the work the decorator's hand, and reserve the ord "trade" for the business side of his ansactions.

And I am making here no invidious stinction. I am not at all sure but hat the best thing for an artist is that he ould have to earn his living at his art and vn it his trade. There is at least one ex- mple that may be cited of a great painter en who conducted what is called his "pro- ssion" in a thoroughly businesslike and en tradesmanlike way, Sir Joshua Reynolds wit; and no one has denied that he was honour to English art.

There comes a point of course at which t is hurtful to trade interests, or at which t in turn is hurt by concession to trade fluences; but as for art and handicraft e two things are and always have been separable.

Without craftsmanship art is inconceiv- le. Without art handicraft is hardly orth its name.

All art presupposes craftsmanship, and in craftsmanship there is at least the promise art. The two are so engrafted together at it is hard to say always where craftsman- ip ends and art begins. In fact, it seems me they are not two, but two phases of e same thing: the one is, so to speak, the wer of the other. It is workmanship which der favourable conditions blossoms into t.

There is so much "high-falutin'" talk out art that one is almost ashamed some- nes to call oneself an artist. Perhaps it ould be more becoming in us all to profess s and claim only to be workmen—leaving for our work to show the kind of workmen at we are. For my own part I place work- anship so high, that to be a good workman about as much as anyone need claim. If is an artist his art will speak for itself. It is rather a sordid satisfaction that we t from being acclaimed great artists by ople who don't know anything about art. hat really warms our hearts is when a workman recognises that we have done a good bit of work.

*A paper read before the National Association of ster House-Painters and Decorators of England and les.

What Decoration is.

There was a time perhaps when all art was decorative. If that was ever so, the times are changed. Decoration is nowadays only a division of art, and house decoration is only a division of that division, and even house decoration is divided into two—into what claims to be entirely an art and a fine art, and into what is content to be a mere matter of business.

It is this last subdivision which is to be deplored. There is only one thing more deplorable. Worse than the professional attitude, with its unwarrantable pretensions—worse than the dead level of business practice, which may at least be honest—is the quackery which takes the name of art in vain, using it only to decoy the unwary and to conjure the unearned money out of their pockets.

And neither art nor trade has the monopoly of this kind of quackery. There is, on the one hand, the too cunning tradesman who, as it were, covers over the cracks and flaws in his work with a label describing it as art, and does infinite discredit to the genuine thing; on the other, there is the too artful artist who pretends that his amateurish attempts are the only true form of decoration, and by his absurd pretensions not only puts up the back of practical men but gives to sane people generally the erroneous idea that art is incompatible with commonsense.

But that is by the way. My point is the mischievous severance of the *art* of decoration from the *trade* which, if not a comparatively new thing, is certainly more complete than in old days it was. And the reason of it is not far to seek.

Art and craftsmanship, I said, are inseparable. It is difficult to draw a hard-and-fast line between them, and say here one ends and the other begins.

For, the moment the consideration of beauty (apart from utility) enters into the calculations of the workmen he touches on the domain of art.

And it is all but, "if not quite," impossible for a man to carry workmanship to its furthest point *without* concerning himself about the beauty of his work. As a matter of fact, no man does; and so it is that art and craftsmanship are bound up together. But it is quite possible for a man of business to carry on his trade without regard to art; as a matter of fact, the *mere* man of business not himself a workman usually does.

I am not going to whine about "the good old times"; no doubt they were in some respects better than those we live in and in some respects much worse. All I mean to say is that the conditions have changed, and that in regard to the carrying on a trade according to the principles of thorough workmanship, to say nothing of art, they have changed for the worse.

And the change consists largely in this—that whereas house decoration was always in the hands of the workman, of a man who if he did not work with his own hands had done so in his time and knew all about it, the tendency is more and more in the direction of its coming under the control of an enterprising man of business.

It is not by any means now for the first time that the question of business arises. Decoration was from the first mixed up with it. The mischief is not that the decorator has to make it pay—he has always had to do that—but that the working decorator has so often hardly a say in the matter.

Handicraft is being swallowed up in trade, the workman swamped in the enterprise he is engaged in; and we have, as I said, to distinguish between the man who does the decoration and the man who, shall I say, finances it. What ails the art of decoration is not the introduction into it of the commercial idea, but that it begins to lose sight of all interests excepting those of commerce.

Things are done nowadays on a scale involving such outlay as to call for the control of an administrator, of a man of business. But unless the man of business is an artist too (which we can hardly expect that he should be), or unless he leaves the control of things artistic to someone who *is* an artist, how is it possible that art should enter into what he is pleased to call decoration? He cannot help himself. He may quite honestly believe he is going in the direction of art when he is in reality turning his back on it.

We are, all of us, artists no less than others, only too eager to make money. I am not for a moment implying that the artist is more virtuous than the tradesman or more disinterested in his dealings—only the interests of the two classes of men are no longer precisely the same. An artist, or even a workman, cannot, so long as there is a spark of artistic or workmanlike spirit left in him, look at decoration entirely from the point of view of the ledger. Keen as he may be in money matters, he has, if not precisely an artistic conscience to worry him, at least a strong counter-inducement to greediness, and a temptation to risk (if not deliberately to sacrifice) something at least of pecuniary gain in the interests of his work. He is disposed to believe that what he feels to be best *is* best, and is therefore best worth doing, even if it does not in the end pay best. His belief in himself, his very vanity (not to put it on too high a level), urges him to do his best and to do it with an energy of conviction no mere investor of capital would be likely to share. No one will ever believe quite so fervently in the swan-like attributes of the artist's geese as himself—the parent gander!

The misfortune is that the business man, as such, does not believe—is not goose enough, if you will, to believe—in art at all, except as a catchword. The convictions of the artist are not *his*, that he should have the courage of them! And the mountains in the way of artistic success are to be removed only by faith, the faith in art, which we can expect to find only in the artist. People talk of the "enterprising man of business." In the matter of art I have found him, as a rule, anything but that. It is only very occasionally that I have come across one who had the courage to say, "I will do good work, and it *shall* succeed!"

Excessive prudence, not to say timidity, is more the rule. Men of business believe in the success of what has succeeded, and are always more ready to follow somebody's lead than to back their own judgment. It has been my lot to make designs for a manufacturer, which he has kept for a year or two in his portfolios until someone else produced something of the kind. Then he has summoned up the pluck to produce them. That is your business enterprise!

Art has flourished best in trades of no great magnitude—trades small enough to be conducted by, if not an artist, a man not so engrossed in business operations as to have no time or temper to go into questions of art.

Business is Business.

As business grows the chances of art grow less and less—(artists who have gone into business on their own account, and made a big thing of it, will be the first to own that)—and when it comes to monster enterprises, to say nothing of syndicates, the chances are nil. To the man of business "business is business." He takes no account; can take no account, of anything that is to be got out of a transaction but profit; and by profit he means money. The beauty or the ugliness of the work turned out, the perfection of its execution, the satisfaction that any human soul may get out of it in the

doing it or when it is done (except in so far that the customer must not of course be dissatisfied, or he will go elsewhere)—that is all "sentiment," with which as a man of business he would aver he has nothing to do.

Well, that may be so. But sentiment has something to do with art. Without it you cannot get so much as really good craftsmanship.

I daresay some of you think I am making much ado about very little—that the difference between mere tradework and art is not so very great, or that there is ample compensation for what falling off there may be; that what is lost in quality is gained in quantity, that art is brought more within reach of all than ever it was, that it is cheaper, more popular, and that on the whole the balance of advantage is very likely in favour of work done under the stern auspices of trade.

I am not prepared to deny that something which goes by the name of art is to-day more widely spread than ever it was before; that it is cheaper—more within the reach of the million. What I do maintain is that the cheaper, more easily obtainable, more widely-spread decoration, has a fair chance of not being art at all.

What Art is.

What, then, do I understand by "art"? I said awhile ago that it was the flower of workmanship. To put it less figuratively, it is that something in workmanship which lifts it above mere workmanship—that touch of delicacy or beauty, of individuality or originality, which a man puts into his work, consciously perhaps for his own satisfaction, unconsciously perhaps because he cannot help it. It is that which it comes to a man to do—for which reason we call it "inspiration" when it is a great thing that is done. But the same impulse enters into little things, into the most modest decoration as well as into the more ambitious. It is something not to be gauged. It is as subtle as the scent of a flower or the flavour of a fruit. It has no price and is rarely paid for (until a man is famous, and then he reaps the harvest of long years of patience); but whether the artist is paid for it or not, he puts it into his work because he *is* an artist, and it would be no satisfaction to him if he did not.

And he is not much of a workman who does less. There is no fun in doing less. A good workman *winces* at bad work; he does his work well for the love of it.

There is the secret of it—the man's liking for his work.

Commercial enterprise takes no account of that, and in proportion as decoration is carried out on strictly business principles it becomes less and less possible for a workman to put his heart into his work, and so to put art into it. "Business is business," they say—I say business is a part of life. And it is a mistake to separate a man's trade from his enjoyment and his personality. Who, think you, is the happier, the man who is proud of his shop or the man who is ashamed of it? There is not the least doubt as to who does the best work. And why are men ashamed of their shop, except that they do there things they would not do at home? How comes it there is any sting in the word "tradesmanlike"? All that is offensive in it should rather be stigmatised as *un*tradesmanlike if we had not come to justify in trade what we should in daily life call mean, if not dishonest.

The first step, I take it, towards making house decoration an art is not to be ashamed of it as a trade—to adopt it as a calling in which a man can take an honest pride, one which he does not altogether leave behind him when he leaves the shop, one which is never very far from his thoughts, one which gives scope to his best faculties and does not tempt him from the path of manliness.

The next step is to have some faith in art—to be ready to sacrifice something for it.

Artists are not Fools.

Artists have the credit of being quite unpractical people (and I am not going to deny their cussedness), but they are not quite such fools as they are taken for. If they persist often in doing what they feel or know to be the right thing artistically (instead of following the advice of those who would have them do the thing commercially expedient), it is not because they do not know how poor a piece of work will pass muster, but because they know so well how poor a thing it is that is asked of them, and would not think life worth living if that were all they could do in it. They have to live and to pay their way; that much assured, it is not their folly, but their highest wisdom, that they pursue their art even at the cost of ease or affluence. And what if we do not make much more than a living out of it? We are not so greatly to be pitied—perhaps we ought not to expect to be well paid for doing that part of our work which we like best! The men to be pitied are men who make money out of work they have no sort of satisfaction in doing—the men to whom "business is business," who make money and bore themselves with it when they have got it. You remember the story of the shirt of the happy man which was to cure the king—how when they found him at last he hadn't a shirt to his back. Only a percentage of artists belong to the race of dreamers—too small a percentage one is sometimes inclined to think; the majority have perhaps too keen an appreciation of the "main chance," as it is called. Capable artists are as a rule capable men, quite distinctly practical. A man may be a poet and yet an acute man of business.

However, allowing for something in the artistic temperament (and I don't deny it) which is calculated to ensure anything but his success in trade, inasmuch as he is a good workman he is very well qualified to conduct his own affairs.

The quick intelligence, the prompt resourcefulness, the patient industry, the real interest in what he is doing, the belief in it, the determination to carry the thing through (all of which are implied in craftsmanship), are so many qualifications for business, in any thorough sense; yet it is assumed (and will be assumed to the end of the chapter, I suppose, the facts of the case notwithstanding) that, being an artist, he is hardly endowed with common sense—just as we go on making a stereotyped distinction between rhyme and reason! as though the words of wisdom had not continually taken the form of rhyme!

We have all of us, I daresay, known artists born to failure - men who seemed to have no hold upon the world, nor it upon them; but their intention was better than their performance; they were not conspicuously good workmen. One the other hand, who ever came across a masterly workman who was not perfectly well able to take care of himself? So far from his failing on the side of impracticality (how *can* a good workman be unpractical? it is a contradiction in terms), the cunning workman is in danger of becoming too much a man of business.

The Position of the Artist.

I have all along been taking for granted some artistic capacity on the part of the master decorator. Failing that—and supposing him to have the rare wit to know that it fails him—his cue is, of course, to enlist the services of someone who has it. The solution of the problem of twentieth-century decoration lies very likely in the association of the artist and the workman with the man of business—if not in one man, or in two, then in three. But the danger is that the controlling spirit of the three, being the man of business, does not as a rule allow the man of art his share in the conduct of the concern. Of three men working together one must take the lead; but no one of them need have it all his own way. The undue predominance of the business element nullifies the artistic.

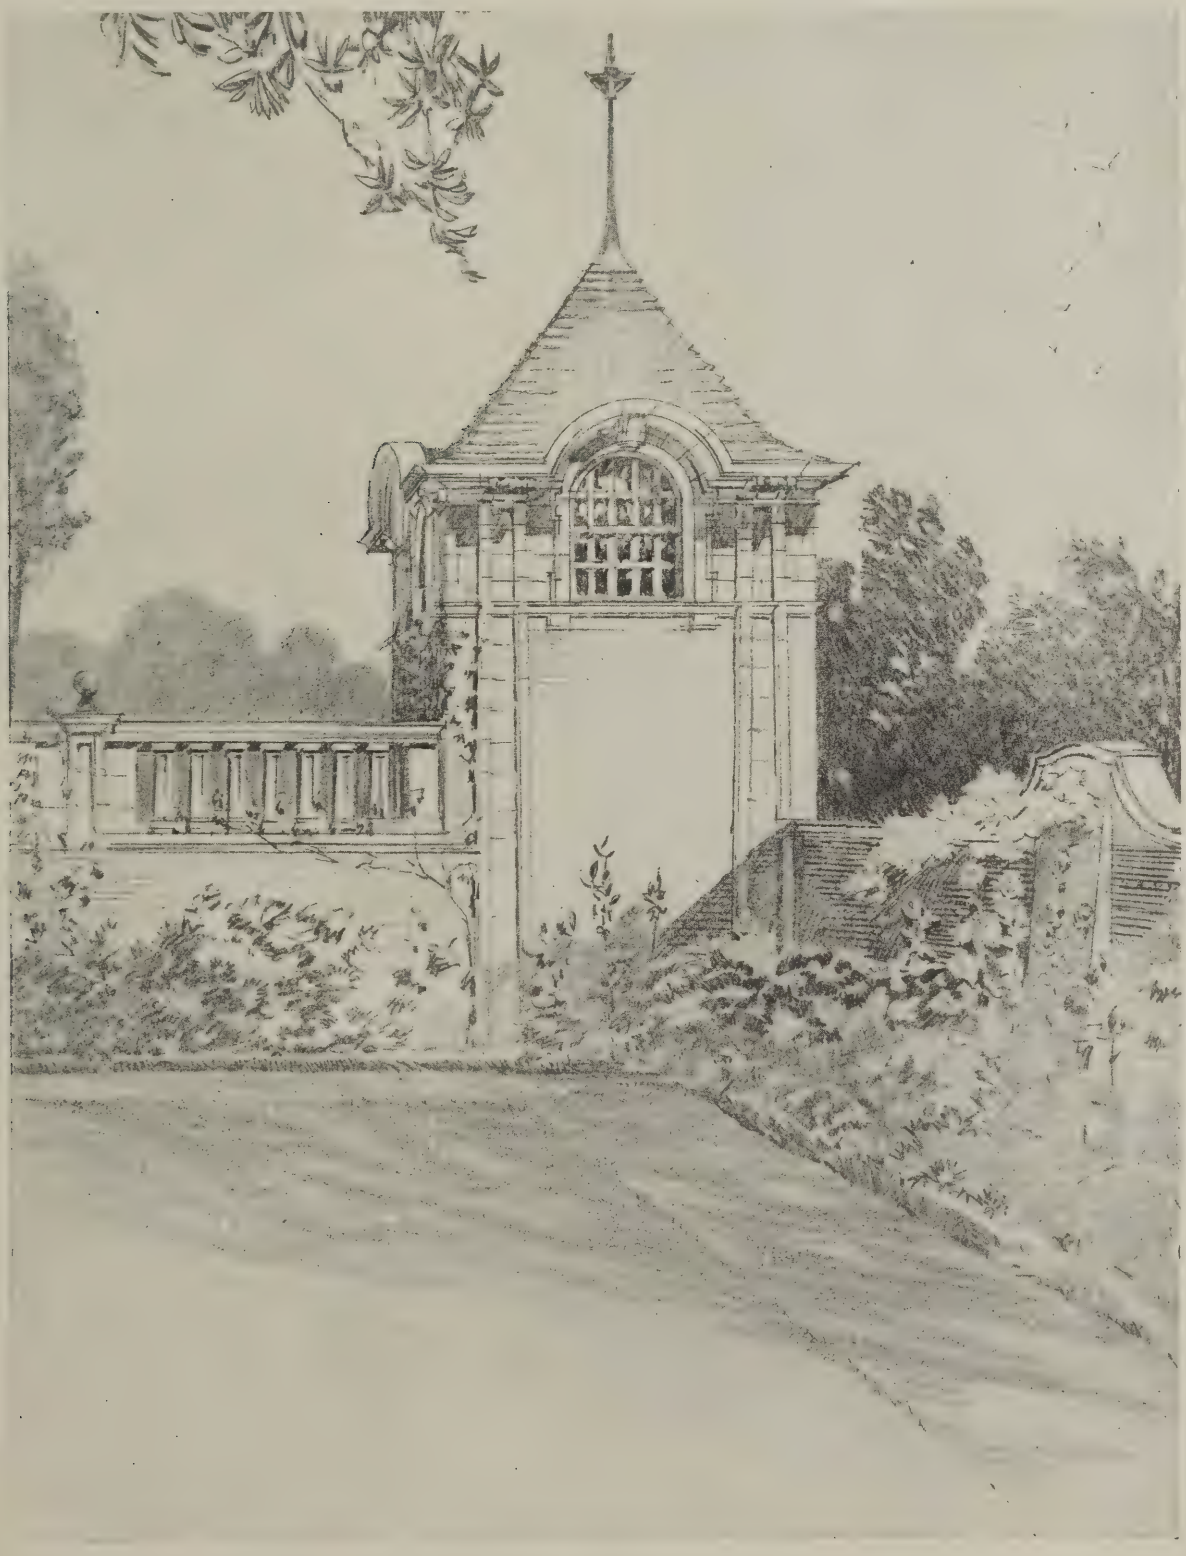
This is very apt to be the case when, as usually happens, the artist is not a member of the firm but only in its employ. I have known good artists practically thrown away because they were not allowed scope for their artistic faculty. It seems odd that a man of business should pay for the services of an artist (and pay highly for them, too and not make anything like full use of them. But that is what frequently happens. If he knows better than the artist, why employ him; if he employs him, why not trust him? One reason why the artist has a bad name with employers is that they worry him and will not leave him to do his own work in his own way, about which after all he is the best judge. Of course, there are impossible artists whom it is sheer folly to engage. My advice to the employer is, take every pains to find the sort of man your business wants, and having found him trust him. Do not engage him if you cannot; do not order him about; he won't stand it—why should he? Consult him on points on which he knows and you do not. And of this I am sure, the more you leave to him, the more you give him his head, the more you will get out of him and the better work he will do. Hem him in with unnecessary instructions, and, with the best will in the world, he cannot work freely, cannot do his best. You cannot get art by simply paying for it. You must allow the artist to be himself. He is a man, not a mere hand.

Now, in all my theorising I have had in view the practice of house decoration, and the standpoint of the Association which has paid me the compliment of asking me to address its members—master workmen, as I understand, some in a large, some in a small way of business, but all, I hope, disposed to combine with trade at least so much of art as may be practical.

I am not pretending to teach anyone his business. What I hope to do is to encourage some of the more modest workmen who do not see their way to art, to stir up discontent in some who are too easily content with trade, to make you one and all at least think of your trade in its relation to art. Whether you think with me does not in the least matter. I may be more helpful to those who are not of my way of thinking, if only by way of stimulus or irritant. The important thing is that we should think of what we are about, and not go on automatically.

Small Masters.

The possibilities of art are greater, I think, in the case of small masters than of big employers working for the million. The bait for *them* is cheapness. But they will sometimes rise to art too. I have had a good deal of experience in the production of things into which art enters, and have been in the habit for years past of taking pains to find out how far art is paid; and I have rarely found a good thing to be a failure altogether—or else there was a very good reason for it. I have continually been told, "Oh yes that's all very well, but I have tried art, and it does not pay." But when I have enquired into the art so-called, the wonder would have been if it *had* paid: perhaps the design was good and the colour atrocious or the workmanship was cheap, or it was in a style that was notoriously out of favour. Perhaps the manufacturer mutilated the design before he produced it; perhaps he meant well, but was no judge of art; perhaps he got into the wrong hands altogether. Do not understand me to imply that the best art sells best, or that art of any kind sells best. It does not. But, for all that, it pays. It is the best advertisement. It attracts people, who talk and spread your fame, and



bring to you customers for trade work, admittedly far more profitable than art. Was there ever a better advertisement for drain pipes than art pottery? Art pottery itself can be made to pay (as French potters have shown) on a small scale—on a scale which admits of the personal supervision of the artist—and does not necessitate a larger output than is warranted by the "following" of the artist. And what applies to pottery applies to house decoration. A good artist, with practical qualifications and no desire to undertake more than he can himself supervise, can always make a living; and if any man is to be envied, perhaps he is.

But the point upon which I am anxious to insist is that a house decorator who is not a very great artist, who has not much more than a workmanlike appreciation of good work and a desire to do the best, may quite well raise his trade to something of an art; and it is his own fault if he does not. All that he need have is an ideal and the courage of it.

What is your idea of your trade? Is it to you simply a means of making money? Then I am afraid I have not much to say to you. One trade I daresay is as honest as another; but *that* is a trade into which art has small chance of entering.

Men do not take up a trade, of course, with the idea of furthering art simply. The mere fact of a man's going into business implies that he expects to make a living out of it. But the hope of art in it depends upon his caring for this particular trade, preferring it to any other; upon his being content perhaps to make less at it than he might at some other trade, because he gets partly paid in the satisfaction of doing what he does. So much liking for his work and interest in it there must be if ever it is to blossom into art.

The all-important thing is your idea of the decorator's business—*that* it is which will determine whether or not you have any

PART OF A SCHEME FOR A SUFFOLK GARDEN. THOMAS H. MAWSON, GARDEN ARCHITECT.

chance of combining it with art. Suppose I give you my idea of it! It is the business of the house decorator, as it seems to me, to make decorous the houses of those who employ him. His first business is to consider the wants of his customer. That does not mean to say that he has simply to take the customer's instruction and execute them. He knows, or ought to know (and if he does not he is not much of a decorator)—he knows, I say, much better than his customer how his instructions would work out, and he is in duty bound to tell him when his ideas are impractical, wasteful or in anyway likely to work out unsatisfactorily; to suggest to him in what way they could be improved upon; and generally to encourage him to do rather better than he meant—I don't mean to spend more money, but to have everything well done, and something that he may grow to.

But all the while it is the customer's wants and not his own ideas that he has to carry out. It is neither a *tour de force* in art nor an experiment in decoration that is asked of him. Experiment he must, of course. If he is to keep abreast with his trade, he must lose no opportunity of widening his experience, whether of materials or methods of execution or styles of work; but not at other people's expense, unless they are willing.

How far he may confine himself to one particular style of work and insist upon doing that or nothing is a question (1) of the strength of his personal bias, and (2) of his position—whether he can afford to risk it. If he can, he may make a reputation that way, and it may prove in the end very good business; but to do that he must have some reputation—in fact, a man must have earned the right to take up such a position. On the part of an unproved man it would be intolerable, no proof of art but of artistic arrogance. But I need not dwell upon this; it is the fault to which the decorator is not so prone as the outside artist, who in the matter of decoration is an amateur.

Even in the carrying out of other people's wishes there is ample room for the expression of the decorator's own personality. He need not write himself large all over the house. If he is a man of any strong taste or conviction it will be apparent in his work in spite of himself. And that is where so many decorators fall short. Either they have no convictions or they have not the courage of them; they work to-day in this style, to-morrow in that, according to the fashion.

I am not complaining that the fashions change (we change ourselves; our work to-day is not, let us hope, just what we were doing ten years ago, and yet it may be very distinctively ours). I complain only that we are too ready to follow a fashion, and work all alike, and I maintain that it would be at once more artistic and better business to work as far as possible in our own manner, in which we could thus perfect ourselves and by which we should in time (if we had anything in us) make our mark. I say it is good business, because when you are doing what others can't (or don't) you can charge more your own price for it, whereas the price of what everyone is doing is cut down by competition.

Why the Last New Thing?

It has always been a mystery to me why tradesmen make such a feature of the last new thing. I don't believe it is to their interest to drop, let us say, a system of wall decoration, or a material, or a pattern, just when they are beginning to find out what they can do with it. Fashions get stale, I know, but the reason why they get stale so quickly is that we work them to death. No wonder they get played out.

I doubt if on the whole quick change in fashion even leads to business. Some folk may get dissatisfied with what you did last year and want something fresh, but it does not follow that they will come to you for it; they may vent their dissatisfaction on you, and try someone else. And, in any case, it makes folk shy of spending money on what they know will be old-fashioned in a year or two.

Now, what is never in fashion is never old-fashioned. People don't get so readily tired of it; and if the work you do for them grows upon their liking they are likely to come to you again when they want more; and that is the sort of business there is some satisfaction in doing. Moreover, if you work out something like a style or system of your own, you become expert in it; you make fewer mistakes you can estimate cost with greater accuracy, and your experience all counts.

You may think that is all very well for here-and-there an artist of very exceptional ability as a designer. He need not be a designer at all. He need only be a man of some taste and judgment (qualities, I think, implied in the decorator) and of some character. In every walk of life character counts, and without it no man, whatever his gifts, arrives at anything very great.

I don't want a man deliberately to set himself to invent a new style; that is not how it comes about at all; all he has to do is to follow the hint of his own experience, and it will lead him in time, without his being aware of it, to something like a style of his own.

We have, everyone of us, our failures and our successes in decoration. All we have to do is to follow up our successes; not to go on merely repeating ourselves, but to ask ourselves why this came out well when that did not, to profit by the lesson of experience, to work the fruitful vein, to encourage our customer to choose what we have confidence in. Really it is very much in our power, as every salesman knows. What constitutes a good salesman?—the putting things before people with such confidence that it is contagious. There's no argument like saying, "Well, if you don't like it when it is done, I'll do it again"; and if you know what you are about you don't have to do it again. A decorator should be ready to undertake the responsibility of decoration. It is for the man who is going to live in the room to say whether he will have it red or green or yellow, light or dark, bright or low in tone; but of the precise shade of colour which in his sunny or sunless room will do best the decorator should be the best judge. And in the choice of such things as papers or other wall-coverings people want direction, and would take it if it were given them in the right way. They will not take the pattern you like in preference to the one they like themselves; but if you can tell them why the pattern of their choice will not hang well, and why the one you recommend will, they will generally listen to reason. And, then, why show them such a bewildering lot of patterns which you know, if you are a decorator, will not lend themselves to decoration?

Wallpaper Patterns.

Every decorator knows (what his customer does not) that the patterns which look most pleasing in the book are not the best on the wall. There are patterns (and they are the best) which would never be chosen from the pattern book, which the customer must take on faith, on the recommendation of the decorator, and which it is his business as an artist to recommend. The prettiness, as they call it (the pettiness as I should call it), the finish as they call it (the finnikin detail as I should call it), which is attractive in the book goes for nothing on the wall, or worse than nothing. And the broader and more dignified designs which make for really decorative effect look bald or coarse or simply uninteresting in the sample.

Friezes.

Think of the friezes that bring down the wall by their heavy colouring and full detail—mere variations upon a fussy wallpaper they are designed to "go with," and go with far too closely. And the dull colour of them!—all because the paper-stainer did not know that close under the cornice of an ordinary room the brightest colour is none too bright, or else was afraid of what it would look like in the pattern book.

Ceiling Papers.

That is how it comes that in nine-tenths of the ceiling-papers produced the pattern covers far too much of the ground. A ceiling pattern can hardly be too open, too empty; which emptiness is quite enough to prevent its ever being chosen except by someone who has had experience in decoration—which you have, and your customer probably has not.

I will go further and say that even the experienced decorator learns only by experience which of the more promising patterns fulfil their promise. And, having learnt it, it is nothing short of folly not to profit by his experience and use the patterns he can depend upon.

Individual Pattern Books.

To use them he should have them handy; not have to hunt for them in a variety of pattern books, but make up his own pattern book. It will do him no harm with his customer to have a pattern book which is not everybody's, which is in a sense his own; the patterns all chosen by him; some of them perhaps his own colourings, which will not be found anywhere else. Certain patterns he might even venture to keep in stock, and so get an extra profit on them. His pattern book would want revising year by year—some designs would drop out, some would continue in use year after year and would be practically almost his monopoly (others having put them aside as old and out of fashion). He would, of course, not harp always on the same old lines—he would be continually adding to his repertoire and so satisfy sufficiently the natural desire for freshness of idea. The craving for mere novelty is, to my thinking, morbid, and not to be encouraged.

What applies to wallpapers and wall-coverings applies to floor and hearth tiles, to firegrates, door furniture, and to whatever manufactured things enter into house decoration. A man of good judgment must know that one make or one pattern is better than another; let him run that for all it is worth, and not cumber himself with what he knows to be second- or third-rate. He may keep such things somewhere in the background to show to the occasional customer who wants to see everything and especially the newest thing; but if he shows them cleverly, the result will be to make his customer quite content with what was shown to him in the first instance. Most men can appreciate the difference between good and bad when it is pointed out to them.

Of course the man who pays the piper expects to call the tune. I am not recommending the musician to pipe according to his own sweet will. I have said already that his business is to put into artistic shape the ideas of his paymaster. All I am arguing is that he should put them into artistic shape; and if all the while, in persuading the customer, he is thinking of his wants and not his own whims, I do not think he will often have much difficulty in guiding him into the right choice, and in so guiding him will impress upon the decoration quite as much as need be of his own personality.

(To be concluded.)

Public Swimming Baths at Coventry have been erected from designs by Mr. Lacy, the borough surveyor, by Messrs. Jones & Evans, contractors.

Complete List of Contracts Open.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
	BUILDING:

New Companies.

George Wragge, Ltd.

Registered with a capital of £30,000 in £1 shares (15,000 preference) to acquire the business now carried on at Wardry Works and the Crafts, Chapel Street, Salford, Lancs, and at 211, Shaftesbury Avenue, W.C., as George Wragge, and to carry on the business of manufactures of and dealers in metal, wooden and other fittings, fixtures and articles, enamels, mosaics, stained and leaded glass, &c. The first directors are G. Wragge and G. Ermen. There is no public issue of shares, the conversion of the business into a limited company being due merely to family reasons. The staff is retained in its entirety.

Tenders.

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, *Effingham House, Arundel Street, Strand, W.C.*

TRADE MARK

SIMPLEX

Simplex Conduits.

The "Simplex Steel Conduit System" is now recognised by all the leading authorities to be the **best method** of installing Electric Wires. It is now almost **exclusively employed** for all kinds of installation work.

ECONOMY and EFFICIENCY

are secured by the use of Simplex. Do not be satisfied with imitations. Every Conduit and Fitting stamped "Simplex."

We are devoting a big factory and all our energies to the bringing out of one product, and it is owing to this concentration of all our efforts that our system to-day stands in the **very front rank** of wiring systems.

An Architectural Causerie.

Pall Mall. There is one street in western London which is pre-eminently "Italian"; this is Pall Mall. There is little characteristically English about it, but an air of stateliness pervades the street, due to the fact that the designs of its principal buildings were suggested by well-known palaces in Italy. It arose at a time when a sort of unwritten compromise prevailed in the matter of styles; churches were occasionally quasi-Classic, but more often in revived Gothic; town halls and law courts wholly Classic; country houses and colleges late Gothic or Elizabethan; clubs "Italian." The choice was a good one for the luxurious structures of Clubland. Where could the architecture of stately ease be better sought than in Italy, and in what period than the Renaissance? The result was a line of palaces of which London may be proud. Unfortunately the street is much too narrow and some parts of it are commonplace; the effect, as a whole, is nevertheless very dignified. The name was derived from the old French game of *paille maille*, which consisted of striking a ball through a high arch of iron at either end of an alley; it was played in the adjoining Mall. The first building is the Athenæum Club, designed by Decimus Burton, to whom we owe the colonnaded gateway and arch at Hyde Park Corner. The clubhouse is stately and severe, well suited to balance Nash's United Service Club on the opposite side. The architect's name is rarely mentioned now, and the fate of his buildings has been, in an artistic sense, a sad one, for his great group at Hyde Park Corner has been destroyed by setting back the arch—and neither that nor the colonnade is crowned with statutary as he intended them to be—whilst the Athenæum has lately been injured by the addition of an upper storey, recessed slightly it is true, but marring Burton's design. Next to it stands the Travellers' Club, by Sir Charles Barry, its design suggested by the Pandolfini Palace at Florence, compact and well proportioned. Then the Reform, considered to be his finest work. Here too it is said that another palace, the Farnese in Rome, was to some extent reproduced; the building is certainly grand; the interior is famous for its fine hall, which is practically "an Italian *cortile* covered over." The Carlton, which adjoins it, is the work of Sidney and Robert Smirke; here the Library of St. Mark at Venice inspired the design, but there are two great differences to be noted: the Venetian building—one of whose angles was destroyed by the fall of the great Campanile—is grey in colour and long and low in form; the English palace is loftier, more compact and decorated with coloured granite—it may fairly be described as a coloured building. The Oxford and Cambridge Club is also by the Smirkes; it has been altered by the removal of the open balustrade which crowned it. On the other side, the Army and Navy Club—known in the services as "the Rag"—was suggested by the Palazzo Corner at Venice. The Junior Carlton, designed by Raphael Brandon, is another Italian Renaissance design, and completes the list. Some attempt has been made of late years to introduce a lighter and more fanciful architecture into this street, and the new departure is exemplified by the quaint red building with high gables at the corner of St. James's Street. At the other extremity, opposite the Athenæum, rebuilding has commenced, and it is to be hoped that some "courtesy of architecture" will be observed in this, the newest addition to the famous little street of palaces.

SIR JOSEPH TERRY MEMORIAL ALMSHOUSES, YORK. ARTHUR J. PENTY, ARCHITECT.

Another Competition Complaint. Architects mean to get their rights by competition and we are glad to see the Associations taking such active steps on their behalf. Willy-nilly, competitions are the means adopted to-day for securing designs of public buildings: they have their advantages and their evils, but the latter are chiefly brought about by the abuse of competitions. There is another complaint against them on p. 196 of this issue, where it will be seen what the Edinburgh Architectural Association has done in regard to the Leith Poorhouse Competition. The conditions form curious reading. They do not describe all the requirements: they require the plans to show how, "in the event of the whole or part of the space to be set apart for a particular class of inmates not being required for that class, it might be utilised for another class, effective classification being, however, still maintained"—which is quite unintelligible to us: they do not state how much the buildings are to cost, but require an estimate first for stone and then for brick: they only suggest the possibility of a professional assessor being appointed; and, lastly, they offer the successful architect a commission of 3 per cent., into which his premium of £100 is to merge. Architects have to live, and, strange though it be to the Leith Parish Council, none of them can make much out of 3 per cent. on an ordinary building. The reply which the Edinburgh Architectural Association received is bluntly negative. We should like to see the same kind of answer given by architects themselves: then, with practically no designs to consider, the Leith Parish Council might doubt its wisdom and omnipotence.

A LITTLE HOUSE BY J. M. OLBRICH.

THE NEW ARCHITECT.

THERE could be nothing "newer" than the wonderful designs which now take shape in Germany, and as so many general references have been made to the "Art" they exemplify, it will doubtless be of some interest to illustrate a few of the worst specimens that have come to our notice. We at once admit that those now shown are among the *worst* we have seen, and while quite alive to the fact that our own architects are not without blemish—indeed, some of them are very piebald—yet these examples emphasize what modern German domestic work is largely tainted with, what astonishing forms are introduced into it, and how novelty is everything and fitness or sanity nothing.

Look, for instance, at the dwelling-house at Steglitz, near Berlin, illustrated below. Could anything be more abusive of proportion? And it is to be noted that this is not a flagrant example of the "New Art" but an everyday design influenced by it, the designer having neither the ability nor the madness of some of his brother architects. Apart from such details as the front door exhibits, or those quaint acorns poised 'tween heaven and earth on needle-like spirelets, what a senseless arrangement of roofs is adopted, what distressing gables, what buttresses at the front corners of the house!—needless, ugly, foolish: but there is no necessity to draw any more attention to such a design; for altogether it harmonises with the gentleman in check trousers who occupies a position to the right of the view and bears a striking resemblance to a music-hall knockabout.

Next we come to the little house by J. M. Olbrich. Now Olbrich is one of the leading men on the Continent in this "New Architecture," and though his work is generally astounding in its general effect there are qualities and features in it both pleasing and skilful. This architect is an Austrian, but for the present we must expand Germany to include Austria, as the characteristics of the new creations of each are alike. Olbrich was a pupil of the celebrated Austrian architect, Otto Wagner, whose work was dealt with and illustrated in the BUILDERS' JOURNAL for November 27th, 1901, but he has nothing of his master's regard for what is beautiful and what is sane: he is a wild artist playing at architecture, a man whose tenet it is to build for futurity and not for the present. Maybe he is a seer and we are children in his hands, but, living in the present, we have to judge with what the present gives us, and therefore cannot appreciate Olbrich's creed that, though people may not like his buildings now, the children who grow up in them will be cultivated by his colourings and have their artistic conceptions moulded by the influence of his forms. We say we cannot appreciate that view of things. It sounds inspiring and noble, but "ein kleines haus" by Olbrich makes us lose faith in his talk. They are only outline sketches that are reproduced here, but what strange fancies confront us! What are those things that dangle from the eaves? They surely cannot be brackets—if they are they are absolutely foolish—and if they be down-pipes, how can one reconcile them with windows and walls? Probably they have no practical use—they are "motifs" which we cannot understand: perhaps our children may.

A "MODERN" VILLA.
MEIER AND WERLE ARCHITECTS, BERLIN.

A DWELLING-HOUSE AT STEGLITZ, BERLIN. G. FRANZKE, ARCHITECT.

Now look at two more houses by the same architect, built for the Grand Duke Ernst of Hesse-Darmstadt as part of his "Artists' Colony." Take the house of the artist Christiansen (see p. 192). There is certainly a feeling of healthiness and cleanness in those white plastered or rough-cast walls, but whatever can we make of that serrated base or of the "antifixæ" which stand up all along the roof edge—those at the lower edges might perhaps stop snow falling, but what shall be said of the others, which look like so many pimples? Then that kind of verandah with its swirling lines. Lastly—and worse of all—that altogether atrocious excrescence where the decorator has been at work. The folly of it is appalling, and its indecency equally astonishing.

There are somewhat similar characteristics in the House Keller (see p. 192). Here also are the plain white wall-surfaces exhibiting a good deal of refinement. The stair window, too, is treated well, though we hardly see why it should have been spoiled by stepping the

bottom. But what is that strange treatment across the gable top, with a useless pediment above it; and how are the roofs to be kept water-tight? And the railings! It is plain writ that the architect is striving for novelty at any cost; novelty he gets, and ugliness with it.

The "modern villa" by Meier and Werle (on the opposite page) is another wonderful design. Very little need be said of it, for all its faults are apparent. It is, however, a good example of the absurd manner in which roofs are commonly treated by modern German architects. It is easy to draw these roofs on paper; it is not so easy to carry them out, or, when they are carried out, to make them keep out the rain. But perhaps we are supposed to regard them as something else, something greater than mere protectors from bad weather.

We next come to the shooting-box at Heinrichshorst near Magdeburg, and it is so bad that one hardly knows where to begin. Suppose we start at the porch, under which that elegant carriage is passing. What a porch! It seems to be Indo-Swiss in feeling, with just a touch of Chinese here and there and something on the roof which we cannot quite make out—as much like a Curtain Road looking glass as the top of a lectern. The main tower of the house reminds one somewhat of the earlier Eddystone light-houses. Of what the other turrets or spirelets reminds anyone it would be hard to say, but the energetic stork is certainly very quaint, and the several beasts are equally amusing. The house seems to have a variety of occupants.

Next we will look at the villa outside Munich (see below). It is much less rampant than some of the others, but it still has strange features enough—that sliced-up front gable and the side gable with the scalloped outline, and that curved bay window which merges mysteriously into the roof below it.

Finally, so far as domestic work is concerned, we have a niche in one of the smaller rooms at the Dresden Exhibition (see p. 195). Here is the New Art in one of its best moods. Wriggles and the "scriggilums" are still plentiful, but there is a great deal of freshness in this design, and the decorated cove with those children drawing circles on it is very charming. The fault about the whole is that it is overdone; but, still, it shows what is possible even in this "Art Nouveau," and we give it as a contrast to the other outrageous work. They are all modern, but in this little niche there is a sanity and a charm which the other work does not possess.

A SHOOTING-BOX NEAR MAGDEBURG, GERMANY. J. GROS, ARCHITECT.

We may now consider some examples of modern street architecture abroad. First there is the trading-house No. 36, Mohrenstrasse, Berlin (see p. 195). Here is a new feature, not shown in any of the other houses, but very commonly adopted by the new school of German architects, namely, huge carved female heads. It is of no use to talk about canons of architecture, or recognised rules or conventions—these architects will have none of them: their creed is novelty, to be modern, new, wonderful. And so we have these gigantic heads, larger than the seated figures above them! As for the plate glass and those thin stone pillars, we need say nothing.

Let us pass to another street front—Nos. 46-49, Leipzigerstrasse, Berlin—a sort of German Crystal Palace (see p. 195). Here again is the same utter disregard for proportion in the figures, the same writhing and twisting and curling forms, and, above all, that great lintel held up by four floors of plate glass. Some bad things have been done in this country in the way of plate glass, but, so far as we know, there is nothing to equal this.

Look again at the art-workshop at Leipzig illustrated on p. 193. Here is the same curling and writhing; and when the whole design begins to be analysed, what senseless practices it exhibits! Where, for instance, is the sense in making the third-floor window of that shape? And what proportion is there between the parts?

Lastly, what shall be said of the Dresden building illustrated on p 194? Simply that, with such a treatment, the use of plate glass is hideous.

Thus, then, we see what private houses and street fronts can be produced by modern German and Austrian architects.

It is most lamentable work, but, be it remembered, these men are not producing it for fun—would they were!—and their mad influences come back to us. There are many new motives in it, but these are so exaggerated and so functionless that they offend all sensible persons and get their authors looked upon as novelty-madmen.

(To be concluded.)

A VILLA OUTSIDE MUNICH, BAVARIA. M. DÜLFER, ARCHITECT.

THE HOUSE KELLER, DARMSTADT, GERMANY.
J. M. OLBRICH, ARCHITECT.

HOUSING.

Municipal Builder and Private Builder.

IN his sixteenth article on municipal socialism the "Times" correspondent says :—

The chief argument adduced in favour of municipal house-building is that private enterprise has failed to do more than provide the working classes with slums, and that "the helpful hand of the municipality is indispensable." Private enterprise, says a writer in a Socialist newspaper, which furnishes its readers with such arguments almost week by week, "has had all the chances in years past, and what has it made of them? Rash speculation, jerry-built slumdom and the woeful want of housing accommodation confronting us everywhere." To this it must be replied that private enterprise has in no way been restricted to the provision of slums; that it has done far more to supply cheap and healthy house accommodation for artisans and labourers than it gets credit for; that the effect of municipal action has too often been to check rather than to encourage; and that in the case of London, at least, there would probably by this time have been as many tenements available for the working classes if the London County Council had not sought to "help" at all as have been added through the "enterprise" of that particular body . . . .

Such is the position in regard to the cost of building artisans' dwellings at the present time that although housing companies and trusts, managed on business lines, secure profits ranging from 2½ to 4 or 5 per cent. (as compared with the losses too often sustained on municipal dwellings), it is morally certain that if any new company were to start operations within a reasonable distance of the City of London it would not be able to earn more than about 2½ per cent. . . .

The check given to trusts and companies has naturally been ever keener in the case of individual builders, with smaller resources to fall back on; but when one bears in mind what enormous collections of small-house property have sprung into existence of late years in the neighbourhood of Edmonton, Walthamstow and other districts, converting hamlets into populous towns, there is still further reason for suggesting that private enterprise has done much more than the advocates of municipal house-building are willing to give it credit for.

The scope for municipal action would seem to be more in the direction of a vigorous application, wherever possible, of the powers possessed under Part II. of the Housing of the Working Classes Act in preference to a resort to the excessive, if not extravagant, expenditure involved in the application of Part. I.; and in the direction also of allowing the fullest possible scope to independent effort for the provision of fresh house accommodation wherever private enterprise is prepared to exert itself, while still willing to accept conditions consistent with the public health and well-being. In London especially the housing provision for the working population is, taken as a whole, so bad and dear that anything which great companies and private builders can do is of value to the community in helping to remove the congestion and the insanitary conditions in which so many of the people live. Such independent effort should meet with every possible encouragement instead of the most serious discouragement. In many cases municipal authorities have assumed too readily that there was no hope that private enterprise would take action, and different results might often have been brought about if they themselves had given a greater degree of encouragement to outsiders, granting easier terms, modifying requirements, or relaxing particular by-laws or building regulations where such a course could be pursued to the advantage of the builder, on the one hand, and without really prejudicing the healthy conditions or the general stability of the building, on the other. The ideal arrangements would be one under which the municipality enforced its legal powers for dealing with insanitary property, and facilitated in every practical way the operations of private enterprise, especially as regards the granting of building sites on the lowest possible terms, and the concession of some further relief in regard to building regulations, only itself taking action where or when there was absolutely no chance that independent action would meet undoubted requirements. Such a scheme as this would do far more towards the solution of the housing problem than the present system of municipal competition, which threatens to leave upon the hands of local authorities the entire obligation of providing dwellings for the artisan and labouring classes.

On Wednesday last Mr. Edmund Barnes, Mayor of St. Pancras, laid the foundation-stone of Goldington buildings, a block of working-class dwellings which are about to be erected at the corner of Great College Street, Pancras Road. The mayor said that the site had cost £6,500, and the contract accepted for the building amounted to £17,734. They did not anticipate that any charge would fall on the rates for these buildings. Captain Jessel, M.P., said they had heard a good deal about municipal socialism. They were told that municipalities, in dealing with these matters and taking upon themselves the housing of the working classes, were taking away work that properly belonged to private enterprise. He was associated with Sir Thomas Wrightson in a scheme for the furthering of the objects of the Bill to enable working men to buy their own houses, and he would say that in this great question there was plenty of room for municipal enterprise and private enterprise as well.

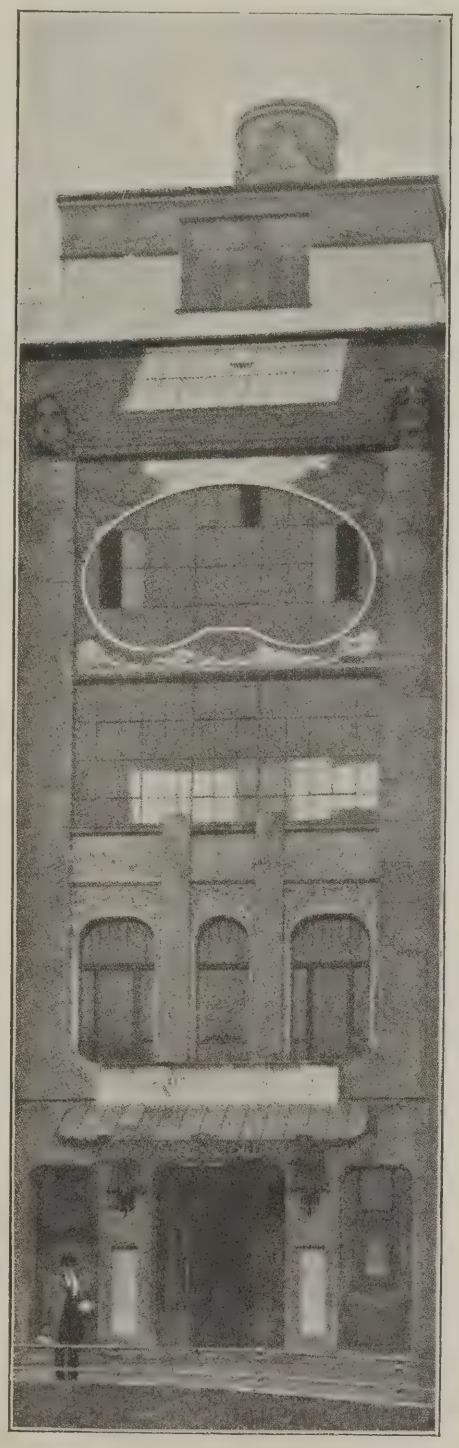
THE HOUSE CHRISTIANSEN, DARMSTADT, GERMANY. J. M OLBRICH, ARCHITECT.

WATER SUPPLY.

Deputation to Mr. Walter Long.

ON Wednesday last a deputation representing the County Councils Association, the Sanitary Institute, the British Association of Waterworks Engineers, and the Underground Water Preservation Association waited on Mr. Long, President of the Local Government Board, at Westminster Hall, on the protection of our sources of water supply in England and Wales, urging the pressing necessity for an enquiry into the existing state of the law.

Mr. Long said three questions had been put before him—pollution, waste and water-rights. With regard to pollution, there was a Royal Commission now sitting, and one of their recommendations was: "We are of opinion that the general protection of our rivers is a matter of such grave concern as to demand the creation of a separate Commission, or a new Department of the Local Government Board, which should be the supreme river authority dealing with matters relating to rivers and their purification, which, when appeal is made to them, shall have power to take action when the local authorities failed to do so." How far the deputation would consider that recommendation covered not merely rivers but other sources of water supply, it was not possible for him to say, but he did not think it was in the least probable that they would have put forward that recommendation only to sources of supply which were drawn from rivers. He hoped to hear from the Commissioners as to the views they took of their own powers with reference to pollution; and if they held that they were precluded from enquiring into the general question of pollution, then it might be necessary to include it in any further enquiry, if that should be decided on. He believed the Commissioners held that their powers were ample to enable them to enquire into surface water and its treatment in order to render it pure, and generally to examine into the position of surface water in this country. If that were so, that would dispose of an enquiry into the pollution question. Then there was the question of waste, the evidence of which did not justify him in asking for a Royal Commission to enquire into it. But with regard to the general question of water rights there was no doubt that the general position of the law as to the protection of existing rights and their proper use for public benefit, and the practice of local authorities in acquiring those rights, was in a very unsatisfactory condition. No doubt it was the case that local authorities, in their desire to supply their own districts with water, frequently entirely deprived adjoining districts of water which naturally belonged to them. With reference to the ownership of underground or surface-water rights, there was no doubt the owners were surrounded by privileges which did not attach to the ownership of other classes of property, and this was a question for enquiry and possibly for legislation. Then, with regard to the whole question of water rights and the general law as to the provision of water, there was a point which had not been touched upon, namely, the power of local authorities to secure that everybody within their area should have a proper supply of pure water. The law already provided machinery for that, but he was afraid there were a good many districts in the country where the water supplied was neither sufficient in quantity nor pure in quality. That was an unsatisfactory state of things which ought to be remedied. He was largely in sympathy with the objects of the deputation, but he desired further time to go into the whole question berore deciding whether the matter should be referred to a Royal Commission.



THE LONDON OF A PAST CENTURY.

A MOST interesting article by the Rev. W. J. Loftie, B.A., F.S.A., appeared in the "Morning Post" in connection with the King's procession through London. The following are some extracts from the article:—

The Marble Arch.

On the 5th of June sixty-four years ago the London papers announced that Queen Victoria left Buckingham Palace at twenty minutes to four the previous afternoon, and proceeded to Windsor. If we had read that the Queen left the Park by the Marble Arch we should have thought no more about it, or else should have assumed that she passed through Hyde Park, and, emerging on the north side, had gone on to Paddington or along the Uxbridge Road. But her Majesty did neither. If we remember that Buckingham Palace was at that time as George IV. had left it, that the present stucco front by Blore had not been built, that the Marble Arch stood then and till 1851 in the place for which it was originally designed by Nash, namely, as an entrance to the courtyard—a space, with the palace and its wings on three sides, which was once occupied by a fountain in which Neptune and a harem of nymphs disported themselves—and that the young Queen, whose carriage was followed by three others, all with four horses, emerged from the palace by the Marble Arch and entered the Green Park, we should have attained a clearer view of this particular historical vignette. It may be worth noting here that King Edward VII. is the first king who has lived ostensibly at Buckingham Palace. William IV. never used it. George IV. rebuilt it in great part, and had but just got into habitable repair the year before his death . . . .

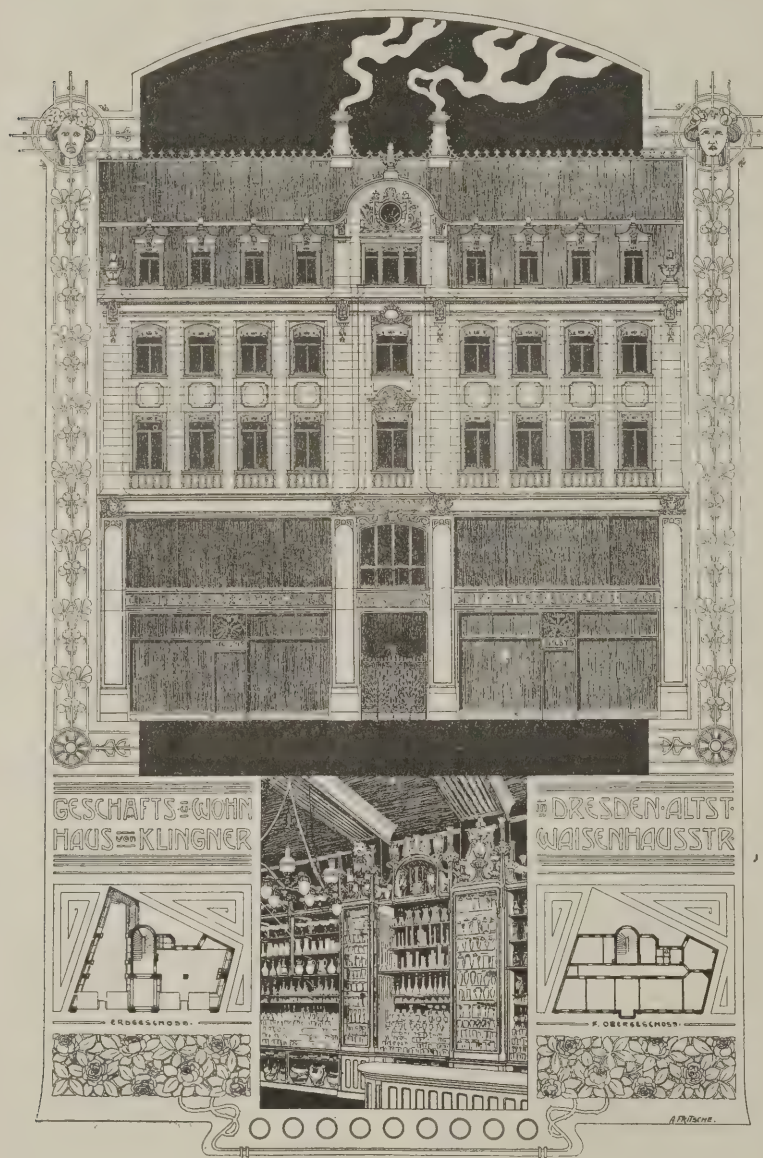
But the best fronts of the present Palace look on the gardens, and were designed by Nash for George IV., and the best interiors by Wyatt. . . . Blore's design for a new front is very unsatisfactory. The removal of the Marble Arch was unfortunate in every way. It had been designed more or less closely after the Arch of Constantine at Rome, and was intended to bear sculpture by the best artists then to be had. Rossi (whose Rodney monument in St. Paul's is so deservedly admired) and Flaxman carved the bas-reliefs and the figures of angels in the spandrels: a statue of King George was to have been on the top, but was never completed. In the moving to Cumberland Gate Parker's beautiful cast-iron gates are said to have been carelessly carried in a common cart, so that the semicircular panel under the arch was so much broken that it has never been set up in its place. Enough remains to be admired as the most important work of the kind in England, even excelling the gates of Venice, of which we have heard so much of late. Now that the national monument to Queen Victoria is to stand in front of the Palace, we cannot but wish anything so worthy as the Marble Arch was in place of the present plastered and painted apology for a piece of regal architecture.

WORKSHOPS AT LEIPZIG, GERMANY.
F. DRECHSLER, ARCHITECT.

Marlborough House.

There are artistic as well as historical associations connected with the residence for so many years of King Edward and Queen Alexandra, and now of the Prince and Princess of Wales. The house, built by Wren, in the same simple but well-proportioned style which he employed at Tring Park and many other places, was, like the Tring manor-house, much disfigured by the addition of an attic by some architect who did not take the trouble to use Wren's figures. A painted staircase showing Marlborough's victories. by Laguerre, was long hidden, but forms almost the only original decoration left. But the house has other and perhaps better artistic associations, for here, after the death of Queen Adelaide, to whom it had been appropriated as a dower house, the School of Design, set up after the Great Exhibition of 1851, was established.

Dover House; The Admiralty; and Charles the First's Statue.



On emerging from the Abbey Church after the Coronation the King and Queen took a somewhat different road back to Buckingham Palace. Returning through Parliament Street, the Horse Guards were passed, and beyond it a house which is of interest both architecturally and on other grounds. It is now the Scottish Office, but is still usually called Dover House. The low dome and portico are in a good style, by Henry Holland, and were added to an older house built by James Paine in 1758. The Admiralty stands

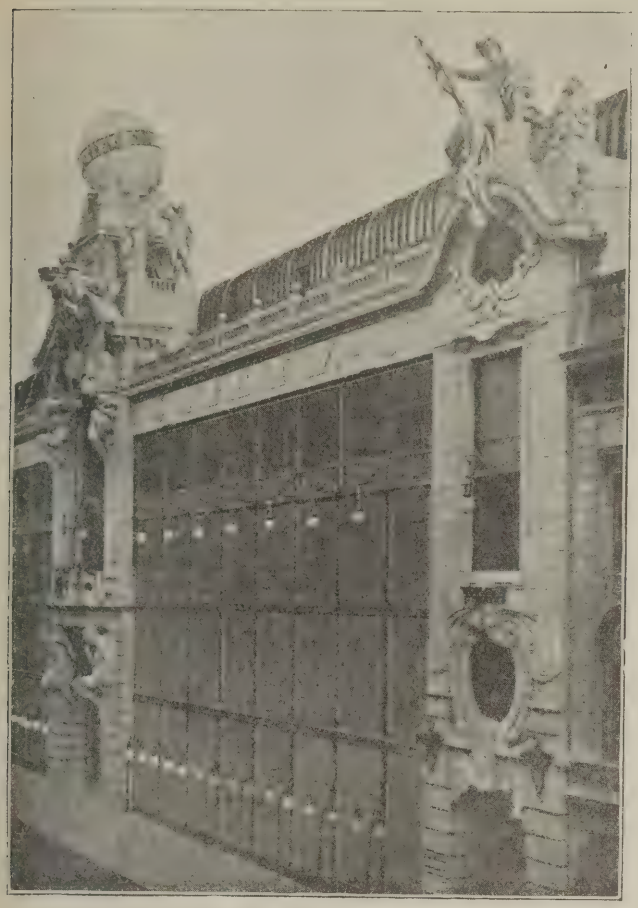
behind a screen decorated with sea monsters. The screen, which was designed by Adam, is handsome, but Ripley's portico within cannot be admired.

As we reach Trafalgar Square we pass the statue of Charles I. by Hubert Le Sœur. It had been cast, but never set up, when the troubles of the Civil War broke out. It was then sold to a dealer in brass in Seven Dials, who had the foresight to keep it intact until the Restoration. He showed pieces of the same kind of metal, and even made some money by selling articles supposed to be cast from the fragments. In 1674 he was, rather unwillingly, it is said, induced to part with the statue, which was set up where Charing Cross had formerly stood. While Queen Victoria was on her way to the Royal Exchange in 1844 someone in the crowd contrived to steal King Charles's sword, which was loose, and it has never been replaced. Another king's statue is in Cockspur Street, Wyatt's George III.

The Reign of Stucco.

The whole of the district at the eastern end of Pall Mall has been greatly changed of late years. Warwick Street and the houses fronting towards Cockspur Street have been rebuilt. Carlton House has disappeared, as well as the great stucco Opera House. A new hotel, handsomely built of stone, faces into both Pall Mall and the Haymarket, and is called after the Prince's Palace. Improvement is also busy in Waterloo Place and the lower reach of Regent Street. The fine plastered and painted house which Nash built for himself has become shops and stores. The craze for cast instead of carved architectural ornament died out very rapidly, and the porticos and pillars, the friezes and capitals which did duty for art are gradually but surely being superseded. In one sense taste was good then, but Portland cement led it away with the help of drab paint. At the time when the fine designs of Nash and Wyatt were made nobody suspected the soundness of the material from the artistic point of view. In some cases fine house fronts in stone, marble and granite have been substituted; yet, from faulty and anomalous designs, they do not look much better than the old stucco.

R. SCHLEINITZ, ARCHITECT.



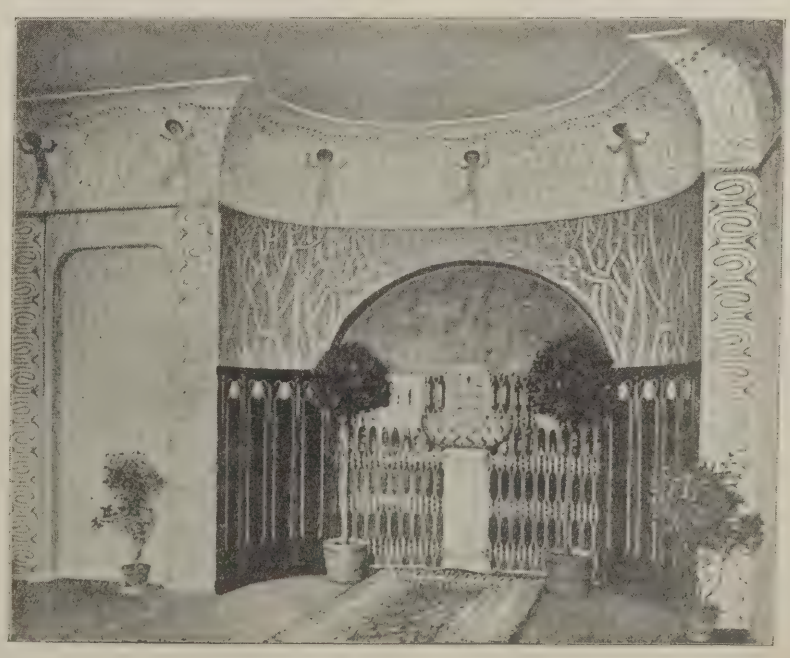
A Primitive Methodist Chapel and Sunday School at Port St. Mary is being erected. Local stone with limestone dressings is being used. The chapel is 49ft. long by 36ft. wide and will provide accommodation for 320 persons. The sole contractor is Mr. J. W. Corrin, of College Green, Castletown; and the architects are Messrs. Robert Todd and Thomas Morris, junr., of Gresham Chambers, Lord Street, Southport.

Law Cases.

An Architect Charged with Fraud.—At the Southend Petty Sessions last week, William Allen, architect and surveyor, of Delaford, Southend-on-Sea, was remanded on a charge of obtaining by fraud large quantities of bricks from Peterborough, Plaistow and other places, afterwards disposing of them at ridiculously low prices. Inspector Brown proved the arrest, and said the prisoner was drunk and violent. The prisoner was offered bail by the magistrate, but indignantly refused it.

Quarrying Sandstone: Interesting Case. — Judgment was delivered last week in the case of *Greville and Another* v. *Hemingway*, heard in the King's Bench Division of the High Court of Justice. The plaintiffs, Lord Greville and the Earl of Westmoreland, brought their action as the trustees of the late Earl of Cardigan to recover from Mr. Wilson Hemingway, stone merchant, Dewsbury Moor, Dewsbury, damages for trespass, and to obtain an injunction restraining the defendant from working and cutting stone on the Cardigan estate. It appeared that in 1889 a portion of the Cardigan estate was offered for sale by auction, and the defendant then purchased a lot of land at Woodkirk, in the parish of West Ardsley, Yorks. Another lot of land at the same place was also acquired at the sale by the Atlas Brewery Co., but subsequently the defendant purchased the company's interest in that plot. The conveyances to the defendant and to the Atlas Brewery Co. reserved to the trustees all "the mines, beds and quarries of coal and ironstone and other minerals, including fire-clay." The plaintiffs complained, however, that in spite of that reservation the defendant and his son, and also the Woodkirk Brick and Stone Co., acting under his authority, had worked for and got sandstone from under the land. Therefore, they said, they were entitled to the relief they claimed. The defendant's case was that sandstone and building stone were not included in the reservations in the conveyances. The question for the Court was whether sandstone came within the meaning of the words "other minerals," which were not, the defendant said, used in their widest sense. It was also said that the plaintiffs had acquiesced in the working of the sandstone, and as to some of the acts complained of defendant pleaded the Statute of Limitations. Defendant also relied on the conditions of sale as showing that sandstone was not included in the minerals reserved.—The Lord Chief Justice came to the conclusion that there must be a declaration that the defendant was not entitled to work the sandstone, and an injunction restraining him and persons claiming under him from doing so. There was, he said, some evidence that at one time the plaintiffs knew of or acquiesced in the working of the sandstone, but he had come to the conclusion that any licence, if given, was determined. He assessed the damage for the stone worked without the consent or licence of the trustees at £40, and also gave the plaintiffs costs. A stay of execution with a view to an appeal was granted.

Defective "Dogs" on a Crane: Damages, £125.—At the Halifax County Court recently George Herbert Hall's brought an action against Messrs. J. Charnock & Sons, contractors, for £250 damages, due to alleged negligence on their part. Council for plaintiff stated that his client was employed as a teamer for Messrs. Jagger Brothers, quarry owners, Ambler Thorn. The defendants were carrying out extensions at the tramway depôt in Skircoat Road for the Halifax Corporation, and required a number of "footings"—large stones. They contracted with



SHOP PREMISES, NOS. 46-49, LEIPZIGERSTRASSE, BERLIN.
B. SHERING AND L. LACHMANN, ARCHITECTS.

BUSINESS PREMISES, NO. 36, MOHRENSTRASSE, BERLIN.
OTTO RIETH, ARCHITECT.

Messrs. Jagger to supply them with these footings, and on October 8th, 1901, plaintiff went to the depôt with three large blocks of stone. "Dogs" were applied to the stone and it was lifted by the crane. Plaintiff helped to push the stone to a position indicated by defendants' workmen, but while doing so one of the "dogs" broke and plaintiff was pinned by his right arm with a stone weighing nearly a ton. He was taken to the infirmary, where his hand was amputated. Counsel contended that the law was perfectly clear. If people were invited to visit premises, there was a duty cast upon the owners to take reasonable care by examination, test, &c., that the machinery was in good working order. It was perfectly obvious from the "dog" (produced) that it was not fit to be used, because there was a flaw in it. Plaintiff was earning £1 4s. a week at the time of the accident, and he was out of work twenty-nine weeks and did not earn anything, so thereby he lost in actual cash £34 16s. He had been reinstated as a driver but not as a teamer, and by this he lost £7 16s. a year.—Mr. John Goodman, professor of engineering at the Leeds and Yorkshire College, called for the defence, said he had examined the "dog" in question, but could find no flaw in it whatever. There was a dent, he would acknowledge, but this certainly did not indicate a flaw running through it. As a practical man he could find nothing to indicate that the "dog" would not lift a ton.—The jury found that the defendants were guilty of negligence in allowing the "dogs" to be worked, and gave a verdict for plaintiff of £125, with costs.

A Case Concerning Air-Spaces.—At Consett last week Jonathan Green, of West Stanley, was charged upon six summonses with infringing the building by-laws. It appeared that in March last the defendant submitted plans for the erection of a number of dwelling-houses in Chester Road, East Stanley, and these conformed to the by-laws in allowing a distance of 10ft. between them and the yard wall. After six of the houses were in course of construction, the plaintiff discovered that he had made a mistake and had only allowed a lateral space of 8ft. 11in. He took no notice of communications from the surveyor and the Council's clerk asking him to remedy the defect, which could be done at a cost of £1 per house. The defence was that hitherto the by-law in question had not been rigidly enforced and the Council had asked the Local Government Board to modify it so as to allow a distance of 8ft. only between the house and the boundary wall. The Council having offered to withhold further proceedings if the defendant would only reconstruct the premises so as to comply with the by-laws, the case was adjourned for two months to allow the defendant to carry out the recommendation.

A NICHE IN ONE OF THE ROOMS AT THE DRESDEN EXHIBITION.

Sunderland Building By-Laws: A Test Case.—On October 28th at the Sunderland Police Court a case of considerable interest to builders was heard. Mr. J. W. White, building contractor, was summoned by the Corporation for unlawfully erecting a new building in Colchester Terrace, and of which the party walls were constructed of a less thickness than 9in., as required by the by-laws sanctioned by the Local Government Board. The town clerk (Mr. J. M. Bowey) explained that the present by-laws were passed on June 6th last, and superseded all others, except in the case of buildings commenced before the date they came into force. Mr. White commenced building on July 17th, and when his attention was called to certain methods employed said he would build according to the old by-laws, and not to the new, and that he would give the Corporation the opportunity of having a test case. For the defence, counsel relied mainly on the contention that the words in the by-law exempting work commenced included the laying-out of the streets, drawing up the plans, &c., even though the actual work of erecting the dwelling was not begun. The Bench decided that the words referred only to the subject-matter of the by-laws, and imposed a fine of 20s. and costs. On the application of defendant's counsel they agreed to state a case.

LEITH POORHOUSE COMPETITION.

Action taken by the Edinburgh Architectural Association.

WE have been requested to publish the following correspondence in reference to the competition for a new poorhouse at Leith:—

From the Edinburgh Architectural Association to the Clerk to the Leith Parish Council.

Dear Sir,

Some of the members of the Edinburgh Architectural Association have brought before the Council of that body the general instructions and conditions to be observed in the preparation of competitive plans issued by the Leith Parish Council, and have more particularly directed attention to clauses 10, 11, 12, 13 and 14, and pointed out certain conditions which they consider unsatisfactory.

The Council has now carefully examined the clauses referred to, and begs to lay the following suggestions before the Parish Council with a view to making the conditions more equitable to competitors and more likely to lead to satisfactory designs being sent in, and to the most suitable plans being adopted for such an important range of public buildings.

(1) *Clause* 10.*—The labour involved in preparing the drawings to a scale of $\frac{1}{8}$in. to the foot is very great, and would be of no advantage to the Parish Council or its assessor in deciding on the best design. A scale of $\frac{1}{16}$in. to the foot is suggested.

(2) *Clause* 11.†—It is suggested that the best method to arrive at the relative cost of the various designs is to place the premiated designs in the hands of a competent surveyor to report.

(3) *Clause* 12.‡—The premiums are small, and might reasonable be increased in number and amount. £150, £100 and £75 are suggested.

(4) *Clause* 13.§—While no objection can be raised to the Parish Council protecting itself in the event of the buildings not being proceeded with, it is not considered reasonable for competitors to risk so much labour and expense in the preparation of designs without an assurance that one of their number will be employed to carry out the work if it is gone on with. It is suggested further that the name of the neutral architect should be given now, so that competitors may know beforehand his position and standing in the profession.

Further, it would be more satisfactory that the Parish Council should employ the best skill possible to assist them, and that the decision of the assessor should be adhered to; and in the event of the author of the design to which the first premium is awarded being able to satisfy the Joint Committee as to his ability, fitness and experience to act in the capacity of architect for the proposed buildings, he will be duly appointed in that capacity.

(5) *Clause* 14.**—The commission to be paid should be 5 per cent. on the cost, and this sum should cover the services as detailed in the enclosed schedule as prepared by the Royal Institute of British Architects, and which forms the usual basis for the charges of architects both here and elsewhere.

It would further be more equitable if the premium did not merge in such commission, as the cost of preparing competitive plans is so much greater than for the usual sketch designs.

In submitting these suggestions the Council of this Association take the liberty of enclosing a set of conditions issued for an important competition by another public body, the terms of which received general approval. As bearing upon the points raised in this letter, attention is directed to clauses 1, 2, 3, 8 and 13 in these conditions.

We shall be glad if you will lay this letter before the Parish Council, and trust that they will give full weight and effect to these views of the Council of the Edinburgh Architectural Association.

Yours faithfully,
(Signed) A. HUNTER CRAWFORD,
Hon. President.
(Signed) WILLIAM M. PAGE,
October 2nd, 1902. Hon. Secretary.

From Mr. James Miles, Inspector, Leith Parish Council, to the Hon. Secretary of the Edinburgh Architectural Association.

Dear Sir, *New Poorhouse.*

I submitted your letter of the 2nd curt., with relative enclosures, to a meeting of this Council yesterday, when I was instructed to inform you that the Council is not prepared to reconsider the general instructions and conditions therein referred to.

I am, &c.,
(Signed) JAS. MILES,
October 14th, 1902. Inspector.

Clause 10.*—Each design is to be illustrated by a block plan $\frac{3}{8}$in. to 10ft., and plans, elevations, and sections of the several buildings to a uniform scale of $1\frac{1}{4}$in. to 10ft., together with such other drawings, details and perspectives as the author may consider necessary to illustrate the design. Perspective drawings not to exceed 30 by 22, and to be in black and white and entirely without colour. All others are to be in black and white only. The block plan must show the entire extent of the ground, with the buildings in their relative positions, and the lines of carriage and footways, and also the drainage system.

Clause 11.†—Each design is to be accompanied by a fully detailed description, more particularly as to the heating and ventilation arrangements, and other matters of detail, and an estimate of the probable cost of erecting the buildings in stone and also in brick, including allowances for all requisite details of structure, finishings, fittings and fixtures, and everything necessary for the due completeness of the establishment, but excluding cost of movable furnishings, painting, laying-out of ground and planting; also architect's, measurer's and inspector's fees. The buildings to be of substantial construction, well-finished, and otherwise of becoming character, both externally and internally, but avoiding all unnecessary expense on ornamentation. The matter of cost will form an important element in deciding on the merits of the plans.

Clause 12.‡—Premiums of £100 and £50 respectively shall be awarded by the Council to the designs adjudged to be first and second in order of merit.

Clause 13.§—The Council do not bind themselves to employ either the architect whose design may be adjudged to be the best or any other competitor. In awarding the premiums and selecting an architect the Council may obtain the assistance of a neutral architect.

Clause 14.**—The architect selected by the Council to carry on the work will be paid for all professional services a commission of 3 per cent. on the measured cost of the buildings as executed, which commission will include the value of any premium to which he may be entitled.

Masters and Men.

Strike of Joiners and Plumbers.—Last Thursday the whole of the joiners and plumbers employed in the shipbuilding yards on the north-east coast came out on strike in opposition to the employers' demand for a 5 per cent. reduction in wages.

The Newcastle-on-Tyne Stonemasons have been given six months' notice of the employers' intention to resume the nine-hour day instead of the eight-hour day as at present. The men, although paid by the hour, are generally averse to the proposal.

CLACTON-ON-SEA SCHOOL COMPETITION.

IN his report on the thirty-one designs sent in for the Holland Road School to be built for the Great Clacton School Board, the assessor, Mr. A. W. S. Cross, F.R.I.B.A., says that two were disqualified for contravening the conditions—that by Messrs. Slicer and Blackburn and the design marked "Invicta," the latter because the author's address was given on p. 1 of his report. The assessor considered that the following designs were superior to the others:—"Compact," "Lux," "Bee," "Experience," "VII," "Sunlight," "Empire's Children," "Utility with Economy," "Picturesque" and three designs by "Crowstone." Of these the best, arranged in order of merit, were "Lux," "Crowstone," "Picturesque," "Utility with Economy," "Compact" and "Experience." The assessor continues:—

The author of "Lux" has produced a very compact and inexpensive plan, and although both in draughtmanship and power of design he falls far below the standard set, both by his two immediate competitors and by others, yet, after the preparation of very careful comparative estimates of the three designs placed respectively first, second and third, I feel compelled to give my award in his favour. The author of "Lux" estimates the cost of his design at £9 per head per scholar, or £4,500, but I do not consider, even having regard to its undoubtedly economical treatment, that the design in question—including boundary walls, playgrounds, &c.—can be carried out for less than about £7,000. Architecturally, I prefer design "B." Were it not for the question of cost, I should have placed "Crowstone" first, for although the plan is inferior to that submitted by "Lux," yet, as the perspective view indicates, its elevations could be effectively treated with rough-cast walls and tiled roofs. Its cost, however, which I estimate at about £10,958, is prohibitive. The author of "Picturesque" submits a design of considerable merit, but in view of your instructions that you desire to erect a building suitable for your requirements, but on as economical a plan as possible, I am unable to award this design a higher place. My estimate of its cost is £11,000.

The following are the authors of the six recommended plans:—

(1) "Lux": Mr. T. H. Baker (Clacton-on-Sea and Colchester).

(2) "Crowstone": Messrs. Smee, Mence, & Houchin (London, E.C.).

(3) "Picturesque": Mr. S. Jackson (London, E.C.).

(4) "Utility with Economy": Messrs. Greenhalgh and Brockbank (Southend).

(5) "Compact": Mr. S. J. Adams (Southend.

(6) "Experience": Messrs. Scott & Hanson (London, E.C.).

The School Board have adopted their assessor's recommendation and the author of the first premiated design has been instructed to carry out his design, subject to the approval of the Board of Education. The school is to accommodate 800 children.

THE ART AND TRADE OF HOUSE DECORATION.

By LEWIS F. DAY.

(*Concluded from p. 188 of No. 403.*)

I AM not so sure that the public demand for novelty is so pronounced as it is supposed to be by the tradesman who thinks it such a recommendation. What people do like is to have things that other people have not. They like to go one better than their neighbours; and in offering them something of your own (your own choice, your own combination, if not your own design) you are offering them something that they value. That is recognised by firms who are big enough to have designs reserved to them for the express purpose of being able to call them their own.

I maintain, then, that by not hanging on to the fashion—perhaps only just keeping it in view—by not seeking novelty at any price, not doing just what everyone is doing, a man may make for himself at least as good a business as by going with the crowd, and will be at the same time developing a character of his own in decoration.

Naturally he will perfect himself and his staff in certain ways of work, and make much of this or that class of work. I have no time to indicate the *kind* of speciality a man might cultivate. Whatever it was, he could, being expert at it, do it at a reasonable price.

I have known decorators who made a quite absurd fuss about doing a little bit of stencilling, and put on the price at once for anything they could call "art." I think it would be better business to throw in, if need were, a touch of art, if only by way of advertisement. But I don't pretend to be an authority on business; it may be good policy to charge the utmost farthing for everything, and to recommend to your customer the thing which allows you the largest margin of profit. What I do know is that it is a policy incompatible with art. An artist's policy is always to do the best he can for the money, and to recommend what is best, not what pays him best; and an artist who does not act up to that policy ceases to be an artist and sinks into the mere tradesman.

The position which I have been urging the decorator to take up does not, I said, imply that he should be an artist to begin with; but it does ask something of him, some knowledge of his trade, some devotion to art.

Nothing in the way of art worth having is to be had without that. And this devotion involves some really serious study of the art of decoration. I knew a decorator once who boasted that he had educated himself at the shop windows! That is all very well; but what can they teach him? Mainly what is "going." If, of course, he is only at the bottom of his trade, and he studies the shop windows of those who are at the head of it, he may learn something. But if he accepts that as final, he will not go far. He must educate himself more seriously than that. If he is wise he will haunt not merely the shop windows but the museums, and take every opportunity of seeing decoration old and new—and this not that he may copy it but that he may learn how things have been done, and so be the better able to judge what is the best way to do them. The great advantage in studying old work is, that it has been sifted for us by time; the worst of it has been allowed to perish, and what has been preserved is in the main the best; whereas in the new we have to pick out the good from the bad—sometimes only a little good out of a great deal that is—well, let us say, not likely ever to be preserved in a museum.

And, apropos of education, a decorator ought to know more than he usually does about the technique of the trades subsidiary to his business—wallpaper printing, tile manufacture, glazing or stained-glass, and so on—in order the better to advise his customer and not to incur unnecessary risk. (I know he thrusts that on to the manufacturer as far as possible, but he can't do it altogether.) And it is really pitiable to think of the amount of trouble that is caused by folk, in their ignorance, undertaking to do what is not worth doing, even if it is possible to be done. On the other hand, a man who knows what can and cannot be done in a trade, and what can best and easiest be done, gets the most out of them, and produces an effect very much better than others less well informed can get at the price. It is not so much servility as ignorance which makes a man so ready to say, "Yes sir; certainly, sir; of course, sir; we will do as you please, sir." He cannot warn his customer that an analine stain will surely fade, when he does not know that it *is* analine; nor can he tell him that he chooses the wrong thing at his own risk, which he ought to be able to do. The man who does not know anything of any but one trade only knows that imperfectly.

As to the study of art. Art is such a personal matter that there is no prescribing for a man one fixed course of study; he will go, and he is right to go, in the direction of his bent. All earnest study is to the good. I point especially to old work because it is for the moment the fashion to neglect it, and to make a boast of doing something new. As if anyone could not do something new if he didn't care about its being fit or beautiful, or the kind of thing one could live with!

What, for example, is the merit of emancipating yourself from the idea that a sense of scale is necessary in decoration? And yet one could name a genius or two who have jumped into notoriety by ignoring anything like proportion or scale in their design. Their *drawings* attract attention, as a poster does, by the unaccustomed look about them. The *rooms* they represent must be distracting!

In house decoration a thing of more importance than originality is repose. The "new art" shouts at you wherever it is, and will not leave you in peace. As for originality, there is far too much talk about it and striving after it. Originality does not come of conscious effort, but of our personality; an artist of real originality has only to set out to do the old thing in his own way, and in the doing it becomes somehow original.

To come back to house decoration. What cares your customer about your originality? He wants rooms in which he can live comfortably, to which perhaps he will be confined in sickness. Fancy a lingering illness in a bedroom frantically "up-to-date"! I should say that if a decorator wanted to wreck his business the surest way of doing it would be to overload it with "new" art. (It is all very well, of course, in the decoration of a restaurant or of a public-house, where advertisement is of more account than quiet; but anything less likely to give the impression of *home* it is impossible to imagine.)

It will surprise you, perhaps, to be told by a designer that it is the fashion to make too much not only of originality but of design.

"Every man his own designer" is the cry! In so far as design is what everyone can do, it is not worth bothering about. In so far as it is to be taken seriously, it is only by devoting himself to it that a man even gifted with a rare faculty can hope to succeed.

Designer and executant should always be in touch; the closer in touch they are the better; but they are, with few exceptions, two different men. And it is no wicked taskmaster who has determined this. Human nature will have it so. We must take men as they are. And they are more or less lop-sided. The one man leans towards design; the other, or I should rather say the others, to execution.

There is nothing to prevent an executant from developing into a designer—if he has it in him he will develop into one. It is a good thing for the designer to relax the tension of his mind by a spell of quite mechanical execution. But men are as they are made: on the one hand, nervous, irritable, impressionable, restive, imaginative — designers in fact; and on the other, quiet, steady-going, unimpassioned, perhaps phlegmatic—handicraftsmen. It is absurd to expect either kind to do the other's work, or ask both to do the same. It does not in the least follow that because a man is a good workman he is fit to design, nor *vice versâ*.

We should know ourselves and shape our work according to our capacity—do, in short, what we *can* do.

"Men in their places are the men that stand."

I hope you will not think that I have discussed the art and trade of house decoration from too lofty a point of view.

Certainly I place the calling of decoration high. (I hope you will not quarrel with me for that.) Not every man who writes "decorator" over his shop-front or on his billheads is worthy of the title. He is not really a decorator unless he is something of an artist.

But I am not advocating the high artistic idea of decoration or a standard above the possibilities of trade.

Artists who have served no sort of apprenticeship to the trade of decoration (in which, for all that, they are bold to dabble) take a quite impossible view of what it should be, and have nothing but abuse for it as it is. In this they do not so much prove that they have souls above trade, as that they have minds incapable of grasping the situation or wills not sufficiently under control to submit to unalterable conditions.

The high-talking artist may be in his way a very good artist, but his art is not of the kind that is available in practical decoration.

What I call the *im*practical attitude may be justified in *one* artist out of a thousand. In the other nine hundred and ninety-nine it is not; and their pretended superiority to trade is really inferiority to practical workmanship, upon which they look down. Outside artists do, no doubt, from time to time give a valuable lead to the trade; but they are far too contemptuous of practical conditions to lead it generally or to be safe guides at all.

The problem of practical decoration is to adapt oneself to conditions, of which business is one. And the artists who preach to the contrary misunderstand what decoration is. It is not an independent art. It consists in doing the definite thing to be done—often in making the best of what promises to be a poor job.

And it is nothing less than inflated vanity (swelled head) which prevents a man from finding this a worthy vocation. Who is he that he should expect the world to accommodate itself to him?

To conform to conditions is *not* to lower any reasonable artistic standard. It is neither more artistic nor more honourable to work only according to your own wild will than to do the work that wants doing. The honour and the art alike are in the way you do it. To do the thing that is asked of you, and to make a job of it, is more difficult than to do just what you have a mind to. There is more to be proud of in overcoming stubborn conditions (or in working within them, if that may not be) than in shirking them. It is manlier to earn a living by your trade than to profess an impractical theory of art which prevents your doing so.

The superiority of art to trade (if any) is not that it is free from conditions but that

it imposes upon itself higher conditions than that—acts up to a higher ideal.

Has the tradesman an ideal? He need not want to be called an artist. Has the artist an ideal? He need not mind if he is called a tradesman. The pity is that tradesmen are sometimes such mere tradesmen, that artists are such unmitigated artists.

R.I.B.A.

MR. ASTON WEBB'S PRESIDENTIAL ADDRESS.

THE opening meeting of the session of the Royal Institute of British Architects was held on Monday evening last at 9, Conduit Street, W., the chair being occupied by the new president, Mr. Aston Webb, A.R.A., F.S.A.

At the commencement of his inaugural address, he referred to the dangerous illness and marvellous recovery of our Sovereign the King. Then, after congratulating Sir William Emerson on his knighthood — an honour never before conferred on a president of the Institute — and drawing attention to the prosperous condition of the Institute (the Fellows now numbering 1,700), and the proposal for alliance from the Edinburgh Architectural Association (which was approved by the meeting), Mr. Aston Webb continued :—

The president of the Architectural Association of Ireland (Mr. F. G. Hicks), in his opening address the other day, said, speaking of his Institute, "It isn't a bit up to date, and there seems very little cohesion among the members, for they seldom have an opportunity of meeting." Well, I have heard something of the same sort applied to this Institute, that there is a lack of opportunity for members to meet and know each other, and I propose, with the permission of the Council, to give one or two informal "at homes" here during the session at which possibly smoking may be permitted (to bring us "a bit up to date") and where members may meet in a friendly way and get to know each other better; and I cannot help thinking that, if you will support me by your presence, some good may be done in this direction.

The admission of Fellows to this Institute can hardly yet be said to have arrived at a final and satisfactory settlement, and in my opinion this will not be done until Fellows are elected solely from the ranks of the Associates, except in very exceptional instances. But there is at present a large number of practising architects we wish to see Fellows whom we cannot expect to submit to our examinations. This is a matter which will have to be once more considered by your Council, more especially as the provision for the direct election of Fellows lapses in May next.

The financial position of the Institute is, I am glad to say, satisfactory. Ten years ago we had a capital of £5,800; now we have a capital of £11,500. Then our revenue hardly balance our expenditure; now it exceeds it by something over £1,000 per annum.

It is obvious that this increased prosperity lays upon us the obligation of increased activity, for we are not a society to accumulate funds, but rather to make proper use of those our increased prosperity supplies us with.

The Institute and Education.

A cause which I think this Institute should as far as possible assist is that of architectural education. The Institute, as an examining body, has deliberately left the education of architects to other architectural societies: and in this, I think, they have acted wisely, for the undue multiplication of educational centres is obviously undesirable. The Royal Academy has an excellent architectural school, visited and instructed by architects, but does not undertake very elementary work, and deals with design only. The Architectural Association has recently started a day school dealing with elementary work and worthy of every encouragement; it is a scheme which, I venture to think, this Institute would do well to foster by every means in its power, both financially and otherwise, while individual architects could also do much to assist it by advising parents to send their sons for one or two years to the school previous to their being articled to them.

These two schools at the Academy and the Association do to some extent overlap, and if a certain course at the Association schools could be recognized as giving entrance to the Lower Architectural School of the Royal Academy, much in the same way as certain work at the public schools will admit a man to the University of Oxford, subject, of course, to any conditions that might be thought desirable, a great impetus would be given to both schools, and architects might at last feel that the education of the next generation was in a fair way to being placed on a satisfactory footing that would be capable of great development. There is, I think, no worthier or more unselfish object for this Institute to promote, or one that is more likely to influence architecture for good, than the careful and systematic education of our young men by a system which will not supplant the present system of apprenticeship, but will rather supplement it by supplying that which cannot be learned in an architect's office, or at least can be better taught systematically in a school.

Our examinations are, I believe, proving of real use to the younger men, and, judging by the increasing number that enter for them, they are fully appreciated. Ten years ago 305 went up for these examinations, while last year there were no fewer than 674. The real benefit of these examinations is the work required in the preparation for them. We do not claim that they necessarily turn out artists (these are born, not made), but we do claim that, with the knowledge thus obtained, it enables those who are gifted with the artistic instinct the better, and with the more certainty, to realise their imaginations and aims.

The Question of Competitions

is another of those questions that are always with us, and as long as architects see fit to enter it is plainly the duty of this Institute to do what it can to secure—first, the drawing-up of such conditions as shall be fair to both parties, and at the same time not entail more labour on the competitors than is necessary to enable a competent assessor to arrive at a just decision; and secondly, to secure the adoption and execution of the best design.

With this end in view a series of suggestions for architectural competitions was drawn up by this Institute in 1881, and reconsidered and revised by the Council during the last session. These have recently been sent to all public bodies likely to organise competitions; in addition to which a copy is always sent to the promoters of a contemplated competition as soon as it is heard of by the officials of this Institute. But when all this is done there still remains the question of the appointment of the assessor, a matter of supreme importance both to the promoters and the competitors. Ever since 1881-82 architects have insisted that a professional adviser should be appointed in all open competitions, and in many cases the president for the time being of this Institute is asked to nominate the assessor, and after some enquiry into the matter I can find but little objection taken to the selections made or to the decisions given, bearing in mind, as I well know by experience, that the decision can seldom be thoroughly satisfactory to more than one of the competitors. It has been, however, urged by some that the selection of the assessor should be made by a small committee rather than by the president, and that two or more assessors should be appointed in all competitions of any size. Personally I do not share this opinion, believing that the sense of individual responsibility is likely to give better results in both cases.

How far the system of selecting an architect by competition for the erection of any building is a desirable one will, I suppose, always be in dispute; but that it gives an equality of opportunity to all architects, great or small, known or unknown, is, I think, indisputable; and it has always seemed to me one of the strongest points in its favour, for we all could name men, now doing excellent work, whose first opportunity came by competition, and we know in this crowded world of ours how difficult it is for new men to obtain a hearing.

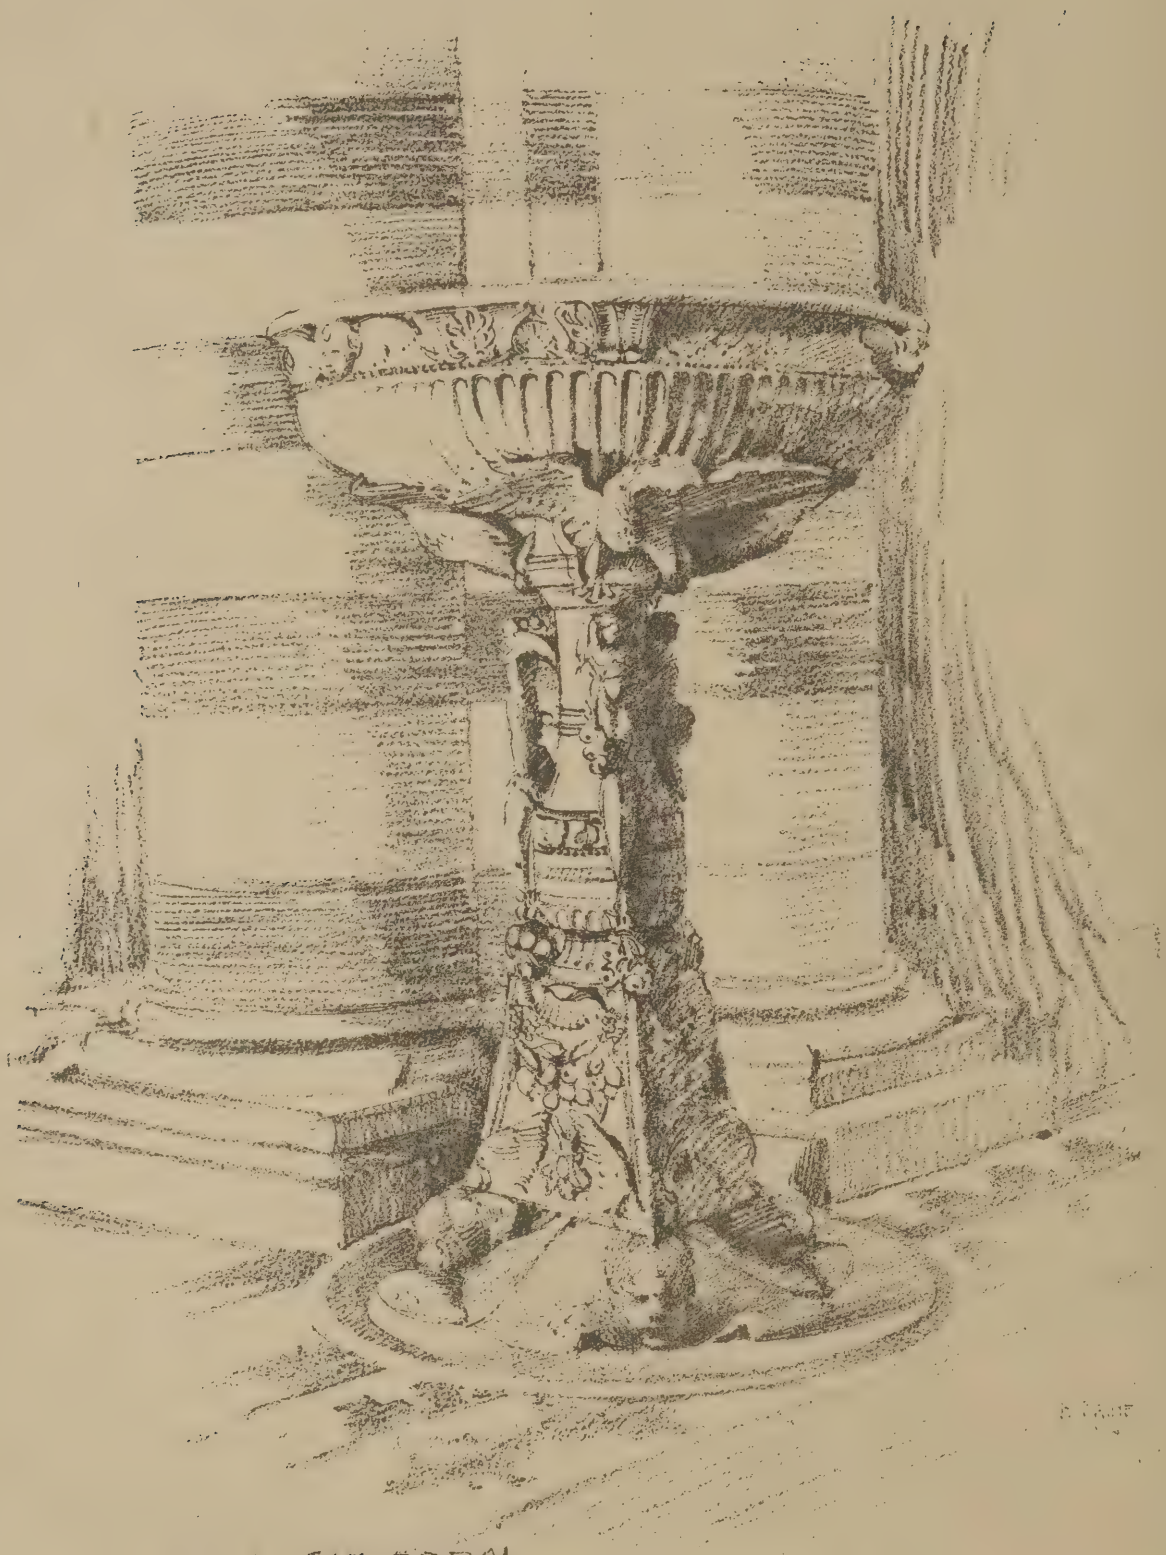
[The president here referred to the Architects' Benevolent Society, stating that out of 617 Fellows of the Institute only 191 subscribed, and out of 1,066 Associates only 70. He ventured to think that this ought not so to be.]

The Campanile: St. Paul's.

The fall of the Campanile at Venice forcibly reminds us of the necessity for continual watchfulness as to the structural stability of ancient buildings, and the engineer's report on the foundations of our own St. Paul's still further emphasizes the fact; and while these instances by no means justify undue interference or rebuilding of these structures, they show the danger of endeavouring to hand them down to posterity in exactly the same condition as we have received them. Most of the members of this Institute will, I think, sympathise with the desire of the Italians to re-erect their fallen tower, and be pleased that the Royal Academy has taken the lead in showing the practical sympathy of art-loving England with Italy in her loss. But how much better, by careful maintenance and judicious repair, to avoid such catastrophes!

In the case of St. Paul's a note of warning has been sounded apparently none too soon, and we look to the guardians of that great pile to take every precaution, on the best possible advice, to ensure its safety, appealing to the Government for funds should that be necessary.

But there is another and even greater danger threatening the buildings and antiquities of the kingdom which would rob us of much that gives this old country its charm; it is, I am afraid, a more subtle danger and therefore more difficult to deal with. I mean the wholesale depredations of



The "Art" Dealer.

I am informed on reliable authority that certain districts in this country are systematically mapped out by these gentlemen, and anything of interest, such as a panelled room, a moulded ceiling, a bit of ironwork even, a chest, or a clock, are all carefully scheduled, the position and means of the owner ascertained, and, as opportunity offers, the property is purchased, the cottage or house often pulled down, the contents sold, generally abroad, and then the land, stripped of its little treasures, is resold. It is difficult to use temperate language about such proceedings; but surely it behoves us, before it is too late, in conjunction with other societies, to see if it is not possible to take some united action to get these buildings and fittings registered as national belongings, so that, at any rate, they cannot be removed from this country, a course which, I understand, has already been adopted to some extent in France and Italy. This is work in which other societies are also interested, and we are always ready to act with them as occasion arises.

How often we see a really noble and

DRAWN BY PERCY WADHAM.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

ostly building hidden away in some inconenient and cramped site, without any approaches worthy of the name, simply because he land was easily obtainable or happened o be vacant at the time, or could be obained cheaply, or to improve the value of djoining property; reasons we have heard ut forward repeatedly, but nearly always sulting in the loss of a great opportunity f ennobling and beautifying the town; hile, instead of money being saved, as is olishly supposed, money is really wasted nd thrown away.

Why is the National Gallery site so freuently pointed to as an ideal one? Surely ecause it has, as so few buildings have in ondon, a slightly elevated site, with a large pen space in front of it, and is approached y a main thoroughfare leading directly to s façade. The Royal Exchange has a fine te, for a similar reason. Wren carefully lanned the most splendid approaches to St. aul's, which would have made the city one f the finest in the world; but the greed and isputes of the citizens unfortunately prented his scheme being carried out. The natter is of still more importance now that ne picturesque manner of the Houses of arliament and the Law Courts is giving lace to a more palatial and formal style. I ould venture to assert, though it should rely not be necessary, that every public uilding should be entirely detached, and ould stand on a site of an area at least half s large again as the area which the buildings ctually cover, and that they should, wherever ossible, have a fine road leading up to them. he Americans are fully alive to this point, nd are laying-out other cities with great onumental dignity.

Another matter which I notice in London nd other places with regret is the disappearnce in the new quarters of the old-fashioned square," which adds so much to the appearnce of the older quarters. The new-fashioned gardens" apparently have taken their place, ne difference being that while a "square" as bounded by a public road, and had the onts of the houses facing it, the "gardens" ave no surrounding road and the backs of ne houses abut immediately upon it. The sult, of course, is that while the "square" dds greatly to the variety and beauty of our reets, the "gardens" are entirely hidden way, and might be non-existent as far as ne public thoroughfares are concerned. The dvantage claimed is the increased privacy btained for the "gardens," counterbalanced rely by the improved outlook given by the square" to the front of the houses, while ne somewhat sordid surroundings of the garden," with its rows of back windows nd its stagnant air, hardly make for beauty r restfulness.

The design and details of buildings are a natter for the individual artist, and not one, n my opinion, in which this Institnte can ften, if ever, usefully interfere; but when reat improvements are in contemplation the pinion of such a body as ours, composed of ocieties all over the country, may, I think, e of great use to the public authorities.

Borough Surveyors and Architecture.

At present, as we all know, we architects re unable to erect any building in any of ur towns without first submitting very comlete plans, and in many cases elevations nd specifications to the borough surveyor, ho exercises under the local by-laws a strict upervision with regard to height and size of ooms, windows, thickness of walls, the inutest details of drainage and other natters; but when it comes to laying-out uburban districts, street improvements, and uch like, which call for the highest qualities f the architect, the plans are usually drawn y the borough surveyor and subjected appantly to practically no expert criticism whatever.

Now, might it not be required that when such schemes have to be prepared they should be submitted for criticism and advice to some expert architectural authority, such as, say, the local Architectural Society, who might also be asked to nominate an architect to consult with the surveyor in preparing the scheme; and, in the event of the Corporation or Council and the Architectural Society not agreeing on any point, might not the question be referred, say, for example, to the Council of the Institute? It surely could not be argued that this would be derogatory to the borough surveyor, for, as we architects cheerfully submit our proposals to the surveyors, there would seem to be no impropriety, but quite the reverse, in the surveyors laying their architectural schemes before the architects and, in important architectural schemes, working with them.

Another matter to which the attention of this Institute has been called is the local building by-laws in many rural or practically rural districts. These by-laws are often drawn up on the lines of the building laws of large towns; they impose most unnecessary and burdensome conditions on those building in the country, and though the attention of the Local Government Board has been directed to the matter, and a deputation has been received, but little more has been done.

The Holborn-Strand Scheme.

The London County Council have schemes on hand of the greatest magnitude, and they have, as is well known, consulted this Institute with reference to the great new thoroughfare from Holborn to the Strand. Unfortunately they were not able to adopt our suggestions in their entirety; but their committee, with the best intentions (which they appear not to have been strong enough to carry through), obtained designs in a limited competition, and a report upon them by an assessor whose decision everyone would have been willing to abide by. This report, however, was not made public for two years, and appears to have remained a dead letter since; and now, I believe, this Institute and the public are absolutely in the dark as to whether there is to be any general scheme or control over the buildings to be erected, and, if so, by whom this control is to be exercised, whether each plot is to be let to the highest bidder, without any reference to a general scheme, and, finally, what has become of the design placed first in the assessor's award; and yet it is hardly too much to say that in almost any other capital in Europe it would be looked upon as a matter of public and national importance, and surely it is one on which all are entitled to be informed.

The encouragement of local schools of art by their municipalities is another matter that should interest this Institute. It will be remembered that when London was being decorated for the recent Coronation the decoration of Westminster Bridge was entrusted to the Royal College of Art; and, mainly through the instrumentality, I believe, of Sir William Richmond, funds were provided by the London County Conncil for the purpose, the students giving their services. I think the Council and all concerned are to be congratulated on this experiment, which might be usefully followed throughout the country, for there are many buildings required for temporary purposes which require erection and decoration, and present precisely the opportunity required for students to try their hands upon. The employment of students in such work is better than their employment on more permanent work, where their inexperience tells against them, and may only end in discouragement.

While considering the responsibilities of municipalities towards the encouragement of the arts and crafts, we may remind ourselves of the responsibilities that lie also with us. We rightly have a voice in the selection of the artists and craftsmen who work on our buildings. Depend upon it, great discouragement is caused to earnest workers, and much harm done, if just to save ourselves time and trouble we take the first article of commerce that comes to hand. Think what a school of craftsmen the enthusiasm of Pugin raised, producing work which is really little short of marvellous when we remember the sort of work that was being done at that time. We still feel its beneficial effects. Gilbert Scott, William Burges, J. F. Bentley, and many others, both dead and living, have done the same; it is certainly one of the directions in which we can do incalculable good or ill to our art, and it is a responsibility of which we cannot and must not divest ourselves.

A Tribute to Bentley.

I cannot conclude without reference to one building recently erected, the Cathedral Church at Westminster, and its gifted architect, the late John Francis Bentley, one of the most inspired church architects of the day.

At Westminster the problem was different from that required by the traditional Gothic plan of a cruciform church, with deep choir and transepts; and this difference naturally and properly affected the whole design, and while an enormous uninterrupted area has been provided for the assembling of large masses of worshippers, the mystery so necessary for the interior of a religious building has been admirably preserved by the careful lighting, the simple intricacy of its arches, its piers, its ambulatories and its chapels. It is a step forward in church building, nobly planned, and one for which we may be all unreservedly grateful. I would only venture to hope that some day the entrance front may be better seen from Victoria Street by the removal of one or two houses, and that the interior of the building may in due course be worthily completed.

Liverpool Cathedral.

Liverpool Cathedral is still one of the possibilities of the future; let us hope that it may prove, when erected, yet another step forward. I have already expressed my opinion that the author of the design named as the best in the first competition should have been given an opportunity of showing what he could do on the new site; it has, however, been decided otherwise. The request in the first conditions for the second competition that the building should be designed in a certain style was a curious instance of the inability of the public to trust architects to design for them what is most suitable, for though this condition has been since withdrawn it is, I believe, generally understood that the promoters remain of the same opinion still. We can only hope that the best man may finally be entrusted with this great monumental work, and that, when it is completed, he may be rewarded by the unstinted admiration of his brother architects, the highest reward any of us can hope to gain.

Modern Work.

We all of us lavish endless praise on old work, but are, perhaps, too chary of bestowing it upon that of our own time. If we are always contrasting the greatness of old work with the inferiority of the new, can we wonder if the public take the same view, and ask us to reproduce for them what we all so greatly admire? It is true we cannot reproduce old work; but the public do not understand that, for we do not teach them so. Great painters are not asked to paint in the style of Giotto, Fra Angelica or Titian, and would not do so if they were. Excellent copies of these great masters are made, and in a few years are sometimes mistaken for the originals; but they are not made by our great painters, and are esteemed of little worth. Sculptors
